AND PACIFIC ELECTRICAL REVIEW.

No. 1904.—VOLUME LXXIV. Number 1. SAN FRANCISCO, SATURDAY, JANUARY 2, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Champion Mine at Nevada City.

The Champion Mining Company's properties near Nevada City are typical of the best class of large, well equipped and well managed California mines. The illustration on this page shows the works on the surface, which include the new 40-stamp mill on the Wyoming ground (shown on the left), the old 30-stamp mill, chlorination works, Merrifield hoist and office. A 10-stamp mill on the Spanish mine is also included in the works, but not shown in the cut. The capacity of these three mills, with their 80 stamps, is about 5800 tons per month.

The property was taken hold of a number of years ago by the present company, composed of San Francisco capitalists, and under the direction of Fred Zeitler it has been built up into one of the largest mining properties in Nevada county. There was, when they took charge, a 10-stamp mill and a small hoisting and pumping rig on the mine. Twenty stamps were added to the old mill, and chlorination works built with a capacity of four tons daily. The old shaft was enlarged 5½ x 15 feet, with three compartments, and has been since sunk to a depth of 1700 feet. A new hoisting plant, capable of sinking 3000 feet, was put in. This plant is equipped with a double friction hoist, geared separately and having separate motive power. There is connected with this a pumping plant capable of handling all the water of the mine. There are five pumps operated from this.

WORKS OF THE CHAMPION MINING COMPANY, NEAR NEVADA CITY, CALIFORNIA.

There are twenty-six drifts, thirteen on each side of the shaft, 100 feet apart to the 1000-foot level, and 200 feet apart to the 1600. These in length are from 300 to 1600 feet each. The property is lighted by an electric plant. Large ore bodies are being stoped from the main shaft from the 1000 to 1200-foot level. A new 5x8 shaft has been started on the Merrifield ground, and is now down over 400 feet. There are twenty-three claims owned by the company, including the Wyoming and Merrifield.

For several weeks past the mining experts, Bratnober, Wartenweiler and Browne have been making an examination of the Champion company's property on behalf of the Exploration Company of London, who are contemplating its purchase. The property has attracted the attention of foreign capitalists for several years, but so far they have failed to secure it.

Mining Legislation.

The Committee on Legislation of the California Miners' Association, which has in hand the proposed bills for presentation to the State Legislature, has, after careful revision, had them printed and copies forwarded to the members of the Legislature.

These proposed bills in their original form were proposed by the MINING AND SCIENTIFIC PRESS and published in the issues of October 31st and November 7th. They were later endorsed by the Miners' Association in November, and since that time have been carefully gone over by Chairman A. H. Ricketts and the other members of the committee. Some valuable changes and additions have been suggested by leading authorities, and it is believed by the committee that their passage will be of great value to the mining industry.

Their adoption can injuriously affect no interests and will be the cause of no extra expense on the part of the State. The necessity for the adoption of such laws has long been admitted on all hands. So well impressed is the Governor with their value that he will recommend in his message next week that they be passed.

There could not be a better time than the present to urge some legislation looking toward a thorough investigation on the part of the State of the questions involved in the deposit debris from the hydraulic mines with a view to reopening them. The Anti-Debris Association should be willing to cooperate in this matter. They must have learned by this time that a great deal more debris comes down from the mountains from other causes than ever came from the hydraulic mines. This debris promises to give them trouble. It cannot be stopped unless the mountains are deserted of all the settlers. The time is coming very soon when a system of dredging out of the streams these deposits must be undertaken by the State. Then, probably, the people of the valleys will be only too glad to allow the hydraulic mines to be reopened if the owners will pay for keeping the streams dredged.

THE reopening of the old Gwin mine in Calaveras county is an event worthy of special note. It has what is claimed to be the largest pay chute in the State, some 1300 feet in length. For sixtee years, the property which had produced a large amount of bullion, had laid idle until two years ago. Thomas, Belshaw, McClure and Voorheis, all miners, took hold of it under a bond for $200,000. Over $150,000 has been expended on sinking a 1500-foot shaft, and putting up a 40-stamp mill. But for the better knowledge now possessed of the value of mines in the district in depth and the reductions made in late years in the cost of mines and milling, this work would not have been undertaken. Within a few miles of the Gwin, in Calaveras and Amador, are other mines upon which similar work is being done, and the amount that has been or will be expended to open up about a dozen large properties before a ton of ore is crushed will aggregate nearly $2,000,000. This says much for the faith of mining men in the permanency of the ore bodies of the mother lode. Many of these mines are old properties that were worked years ago, but were closed down owing to the crude methods and expenses of working that prevented profits being made under the difficulties that arose. In nearly all other parts of the world where there has been recently great activity in gold mining it has been caused by the discovery of entirely new gold fields. But in California practically all the increase in mining has been in old camps where mining has been carried on for over forty years.

THE output of gold for 1896 in the different gold fields is a question that is puzzling many who are trying to guess ahead of the reports of the statisticians. That of South Dakota is already known and was an increase of about 25 per cent over 1895. Colorado, after all, will probably fall short, according to the Denver *Republican*, although the Cripple Creek yield will show an increase.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Works of the Champion Mining Company, near Nevada City, Cal., 1. Leffel Niagara Turbine, 2000 H. P., 8. Standard Single Drum Portable Hoisting Machine, 9.

EDITORIAL.—The Champion Mine at Nevada City; Mining Legislation; Reopening of the Old Gwin Mine; The Output of Gold for 1896, 1. Pocket Mines; A Hospital and Asylum for Disabled Miners; British Columbia; Nevada as a Gold Producer; Progress in the Reduction of Gold Ores, 2.

SCIENTFIC PROGRESS.—Unique Magnetic Experiment; "Progress in the Manufacture of Iron and Steel in America;" The Age of the Niagara Falls, 8.

ELECTRICAL PROGRESS.—Niagara Type of Turbine, 8. To Be Changed from Steam to Electric Power, 9.

MECHANICAL PROGRESS.—Efficiency of the Boiler Grate; Portable Hoisting Engine; Longest Distance Telephone, 9.

PRACTICAL INFORMATION.—New Sources of Error in Mine Surveys; Things That Are Near; Railway Mileage Built in 1896; The Baltic Ship Canal; To Restore Burned Steel Tools; Exports of Gold and Silver for 1895 and 1896; Movements of a Rider's Feet While Working a Bicycle, 9.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 6-7.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 22-23.

MISCELLANEOUS.—Concentrates, 3. The Solution and Precipitation of the Cyanide of Gold; Some Cripple Creek Practices, 4. Certain Stamp Mill Practices; North Carolina Gold Mines, 5. Nevada City District Geology, 8. Index to Volume LXXIII, 10-11. Coast Industrial Notes; Recently Declared Mining Dividends; Commercial Paragraphs; Personal; Recent California Mining Incorporations, 14. Information Wanted; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 23.

A Hospital and Asylum for Disabled Miners.

There has been appointed by President Neff, in accordance with a resolution adopted at the convention of the California Miners' Association, held in November, a committee of three to consider and report upon the subject of a hospital for disabled miners. It is important that the committee should lose no time in devising some plan for carrying out the idea of the convention, for, unless something is done soon in order to bring the matter before the State Legislature at its coming session, whatever assistance may be required from the State cannot be obtained for two years more.

There was passed by the Legislature a bill, approved by the Governor March 14, 1881, and now on the statute entitled "An Act to Provide a State Hospital and Asylum for Miners," which is as follows :

SECTION 1. There shall be erected, as soon as conveniently may be, upon some suitable site, to be determined and obtained as is hereinafter provided, a public hospital and asylum, for the reception, care, medical and surgical treatment and relief of the sick, injured, disabled and aged miners, which shall be known as the "California State Miners' Hospital and Asylum."

SEC. 2. The Governor shall nominate, and by and with the advice and consent of the Senate, appoint five persons to serve as trustees of the said institution, who shall be a body politic and corporate, by the name and style of the "Trustees of the California State Miners' Hospital and Asylum," and shall manage and direct the concerns of the institution, and make all necessary by-laws and regulations, and shall have power to receive, hold, dispose of and convey all real and personal property conveyed to them by gift, devise, or otherwise, for the use of said institution, and shall serve without compensation. Of those first appointed, two shall serve for two years, and three for four years; and, at the expiration of the respective terms, each class thereafter shall be appointed for four years. A vacancy in said Board, from any cause, shall be filled by appointment by the Governor for the unexpired term.

SEC. 3. The said trustees shall have charge of the general interests of the institution; they shall appoint the superintendent, who shall be a skillful physician and surgeon, subject to removal or reelection no oftener than in periods of ten years, except by infidelity to the trust reposed in him, or for incompetency.

SEC. 4. The trustees, by and with the consent of the Governor, shall make such by-laws and regulations for the government of the institution as shall be necessary; they shall appoint a treasurer, who shall give bonds to the people of the State of California for the faithful discharge of his duties; and they shall fix the compensation of all officers, assistants and attaches, who may be necessary for the just and economical administration of the affairs of said institution.

SEC. 5. Indigent miners shall be charged for medical attendance, surgical operations, board and nursing while residents in the hospital and asylum no more than the actual cost; paying patients, whose friends can pay their expenses, and who are not chargeable upon townships and counties, shall pay according to the terms dictated by the trustees.

SEC. 6. The several Boards of Supervisors of counties, or any constituted authority in the State having care and charge of any indigent, sick or aged person, or persons, if satisfactorily proven by them to have been miners, shall have authority to send to the "California State Miners' Hospital and Asylum" such persons, and they shall be severally chargeable with the expenses of the care, maintenance, and treatment, and removal to and from the hospital and asylum, of such patients.

SEC. 7. The trustees shall, annually, as such time as the Governor may designate, report to him, for transmission to the Legislature, such a statement as he may require as to the management of the said hospital and asylum.

SEC. 8. This Act shall take effect immediately.

Since the passage of this statute no appropriation has been made by the Legislature for carrying its provisions into effect. The fact that it is in the statute books relieves the Miners' Association committee of much work it would otherwise have to do.

It is not probable that the State will be asked to contribute very largely in any case. The liberality of the men employed in the mining industry is proverbial, and there can be little doubt that if the State will make some provision for starting the proposed hospital, large bequests would be made. This would certainly be the case if it were once started and put under responsible management that would commend it to the countenance of the Miners' Association.

In considering the question of cost to the State through an appropriation it should be borne in mind that in the end the establishment of such a hospital would mean the saving of money to the State. Many of those who would be eligible to admission now become a charge upon the counties and the State and no part of this expense is paid by private individuals. If a miners' hospital and asylum is established it would be in large part supported, no doubt, by the miners and mine owners. It is to be hoped that the committee will act in time to obtain the co-operation of the Legislature this year.

THE large amount of activity in opening up gold mines in Nevada the past year has led to the question whether Nevada, after all, is more of a silver than gold State. In this connection, Dan de Quille writes that nowhere in Nevada are there any big silver mines—not a mine that will yield the silver that was at one time produced by the second-class Comstock mines. In a few places small veins of milling silver ores are found, but these are generally as valuable for the gold they contain as the silver. The De Lamar mines in Lincoln county, with their phenomenal yield of gold, has done much to attract attention to the possibilities of the State in that direction. Gold properties are being exploited, both quartz and gravel, nearly all over the State, and in many cases by men with large means. It will not be idle to predict that Nevada will, within a year or two, take high rank among the States as a gold producer.

THE Kootenay papers are estimating the output of gold in the district for 1896. At the beginning of the year it was claimed by many that it would reach $10,000,000. Although it will not be over half that, no new district has made a better showing. A very small proportion of the work done was on producing mines, and the development work has proven so many properties of value that a good future is guaranteed. It is estimated that machinery to the value of $1,000,000 has gone into the district during the year. This and the building of railroads and smelters give indication that capital has been inspired with confidence. A large proportion of the ore discovered in the paying mines, while of too low grade to work, now will in a short time as the rates of shipping and smelting are reduced yield good profits.

THE old pocket mines on Bald mountain in Tuolumne county that have in the past yielded largely are now being reopened and worked more than they have been for many years. A pocket miner has an instinct for finding the rich spots that puzzles and surprises the best of miners in other classes of mining. He sees signs of approach to the objects of his quest that would mean nothing to the geologist who has made a study of quartz veins. The capital required is small and the profits often large.

Progress in the Reduction of Gold Ores.

Improvements in mining and milling gold ores are in no better way indicated than in the reduction of working costs per ton. This progress toward cheaper production has made profitable the working of lower grade ores and a consequent widening of the field of mining operations. Properties considered of no value twenty years ago are now producing good dividends upon ores of no better grade than were then in sight. Should this progress continue, ore now of too low grade to work at a profit will become of value.

In comparing working costs, sight must not be lost of the different conditions under which different mines operate. Reduction of ore for $6.00 per ton in one mine may indicate more careful management than at $4.00 in its near neighbor. Difference of cost in different mines cannot be compared to as much advantage as the record of one individual mine over several consecutive years.

The general tendency of working costs is to increase with the life of the mine, if no improvements in methods or machinery are introduced, for hoisting must be done from greater depths or longer tunnels run, a greater length of openings kept in repair, more water pumped and more timbering resorted to. So that a decrease in cost per ton means that greater skill and improvement have been instituted than the financial results show, for they are made in the face of increasing difficulties.

In general, it may be said that the working costs of one mine indicate the costs throughout the immediate district, for the conditions are locally similar. For instance, we may say that the cost at Grass Valley is nearly $8 per ton and that along the mother lode nearly $4.50. But the record of some individual mine or of several mines in one region is of more value than any number of general statements.

The oft published results of working costs are very elusive facts. In considering the cost of production per ton the only real indication lies in the actual difference between bullion produced and dividends paid. Property or machinery purchased adds in a very small proportion to the value of the plant. The life of a mine is short, at best not over fifteen years and in the end the plant is of little value. Very often working costs are given not including general management, legal expense and especially construction accounts. A mine which produces $1,000,000 per year in bullion and pays $100,000 per year in dividends with an annual investment of $100,000 in new machinery during its career is not as good a mine as one which produces $250,000 per year in bullion and $150,000 per year in dividends, although it seems to be popularly considered so.

The fact that the yield per ton given in the following table decreases from year to year is not necessarily an indication that the grade of the ore decreased, but that the lower cost of production permitted of working a larger proportion of the ore found and consequent lowering of the average per ton. The data well illustrates some of the points touched upon.

MURCHIE MINE, NEVADA CITY DISTRICT.

YEAR.	Tons of Ore Produced.	Tons of Sulphurets Produced.	Bullion Produced.	Value Per Ton.	Cost of Mining Per Ton.	Cost of Milling Per Ton.	Total Cost Per Ton.	Profit Per Ton.
1878	6,332	263	$ 80,191	$12.66	$7.15	$2.10	$9.25	$5.51
1879	10,103	528	169,104	16.73	6.93	1.89	8.82	7.91

The carloads here given weigh from 1600 to 1800 pounds.

Concentrates.

THERE are sixty shipping mines in the Slocan district, British Columbia.

AT Grand Forks, B. C., the price of town lots jumped from $150 to $500 in a week lately.

THERE was distributed one day last week in Salt Lake $82,500 in dividends from four mines.

THE Tucson *Star* claims that the gold output of Arizona for 1896 will prove to be not less than $10,000,000.

THE output of the De Lamar mines, Lincoln Co., Nevada, for 1896 is estimated at between $2,000,000 and $3,000,000.

THE gold product of the Rand district, South Africa, for November, '96, was 201,000 ounces; Nov. '95, 195,000 ounces.

SENATOR TELLER characterizes as "all buncombe" the allegation that the new tariff bill would provide for a duty on silver.

THROUGH passenger trains were put on between Rossland and Spokane for the first time over the Red Mountain road last week.

JAMES F. WARDNER has obtained the franchises and other plants of the Rossland Water & Light Company for Montreal capitalists.

A DISCOVERY of telluride ore has been made in the Jumbo mine at Rossland, British Columbia. This is the first found in the district.

THE La Campana Mining Company, whose headquarters are at Tucson, Arizona, are contemplating the erection of a 50-stamp mill on their mine in Sonora, Mexico.

THE manager of the Niagara Mining Company at Bingham, Utah, has added $60,000 to its profits during the past year from milling of lower grade ores than was possible before.

AN order has been issued from the office of the United Verde Copper Company in Arizona that every man in their employ whose wages are garnisheed for debt will be discharged at once.

THE New South Wales geologist reports that from the Falkness mine 555 tons of ore yielded 6534 ounces in gold. From this the net proceeds were $115,000 after paying all expenses.

IN Placer county, Cal., a new five-stamp mill has been completed for the Marguerite mine and plans have been made in putting up twenty stamps on the Gold Blossom mine near Ophir, Cal.

SEVERAL of the men charged with kidnapping Superintendent Meikle of the Garnet Consolidated mine in Sierra county for hiring Chinese, have been arrested and held for trial before the Superior Court.

THE DeLamar Company in Pioche, Nevada, is considering the feasibility of purchasing the Ash Springs water at Pahranagat valley and erecting an electric plant for running its hoists and mills at the mines.

AN option on 50,000 shares of stock in the Elkton, a Cripple Creek property, for $50,000 has been taken up by French capitalists. They had already taken up 50,000 and have an option on 50,000 further, making half the stock in the company.

SOME Denver people are considering a project for building a big smelter at Rossland, B. C. If they do so this will make three smelters projected in the neighborhood within a year, the new Hall mines smelter, the proposed Northport smelter being the other two.

WILLIAM PRITCHARD MORGAN, a Welsh member of the British Parliament, who some ten years ago became interested in developing and working some gold deposits in Wales, is on his way to China, where he goes in the interests of an English syndicate seeking investments.

AS some of our readers missed their last issue of '96 containing the index for the preceding six months, it is reprinted herein. It shows the contents of this journal for the last six months of '96. The most casual notice of what it contains shows how completely the field is covered.

THE Calumet & Hecla Mining Company of Michigan is preparing to sink a new shaft to open up the Osceola amygdaloid, a copper vein entirely distinct from the Calumet conglomerate from which the mine has paid over $47,000,000 in dividends. Three new shafts will be sunk on the amygdaloid.

THE Currie and other claims on the Galena Farm, near New Denver, B. C., being operated by the Vancouver and British Columbia Exploration Company, have been stocked in England for $2,500,000. When the shares were offered a few days ago applications for three times the amount of stock were made.

THE London *Economist* says that ten representative South African mining companies have experienced a loss from the highest point in the year of $173,000,000. Ten companies of "Kangaroos" show a depreciation of $23,820,000; for the twenty companies referred to the depreciation has been $196,820,000.

TWENTY years ago the milling for Pioche, Nev., a dry camp, was done at Bullionville, twelve miles away, a narrow gauge road connecting the two. The Phœnix Reduction Company is now experimenting with the cyanide process on the tailings, with a degree of success that warrants the belief of ultimate profit.

AT the Thistle Shaft gravel mine, near Gibsonville, Sierra Co., Cal., this week a flow of water was struck that could not be handled by the pumps. Some of the men escaped with difficulty. This mine has for a long time employed a large number of men. It is owned by a Scotch company, and has been a steady producer for years.

SOME of the best mining properties of California are passing under complete control and ownership of foreign corporations. So much has been said and sung about this through the years that, were anything added now, what was good would not be new and what was new would not be good. At present the tendency is more than ordinarily noticeable.

A TEAMSTER who has taken a contract for hauling the freight from Elko to the Gold Creek mines in Elko county, Nevada, will put twenty-five teams on the road. There promises to be a larger proportionate increase of activity all over Nevada during the year than in any other State, largely owing to the developments going on in the gold properties.

SAYS James A. Pollock, of Salt Lake City: "Utah's listed mining stocks made a splendid dividend record during 1896, the total paid being $2,384,500, the individual companies paying from 12 to 50 per cent on the average market value of their stocks. With the 1896 payments the total dividends paid by the listed stocks reached the sum of $32,368,500."

IT is announced that Mackay and Flood will in a few weeks begin pumping out the Allison Ranch mine, at Grass Valley. The property paid well until 1868, when a heavy flow of water was tapped and the mine flooded. Owing to the large flow of water, it will be an expensive undertaking to pump down to the bottom, and will take over a year's time.

ARRANGEMENTS are being made to increase the plant of the Alaska-Treadwell mines in Alaska. Robert Duncan Jr., the superintendent, is in San Francisco to order the necessary machinery. A four-compartment shaft and a 500-horse power compressor are proposed. The open work is to be supplemented by underground operations—a new phase in this famous property.

IT is claimed that some of the leads that have done so much for Rossland cross the boundary into the Colville reservation in the State of Washington. This is true of the districts along the international boundary. South of Rossland, in Grouse mountain, some claims, it is asserted, are divided by the boundary. There is likely to be considerable done in the reservation in the spring.

THE Comstock, Nevada, lode affords one of the greatest contrasts in the history of a great mining locality. Reference to our files shows that twenty-two years ago to-day, (Jan. 2, 1875), the lode was selling at a valuation of over $100,000,000, Con. Va., $560, California, $480 per share, and other stocks in proportion. The whole lode, at present quotations, is selling for less than $2,000,000. It would be a good buy at that figure.

SUIT has been brought in Connecticut by the Empire Mining and Milling Company of Maine against the Tombstone Mining and Milling Company of Hartford, Conn., for $350,000. The two companies own adjoining mining properties in Arizona, and it is alleged the defendants agreed to open the property of the plaintiff for $10,000, and that the defendant company in opening the plaintiff's property sold $250,000 worth of ore.

IN 1895 there was exported from Canada 8275 tons of asbestos, while the total product of the United States was only 1010 tons, mostly from Georgia. Much of the mica used in the United States also came from Canada. It is claimed that both these minera's abound in the Black Hills, South Dakota, the mica in the vicinity of Custer City and the asbestos in nearly every district, and only await capital to develop.

NEVADA has never been known as a coal producer, but of late several discoveries have been made. The Nevada Central Railway company has eight men at work on a coal mine near Crum Canyon, near Battle Mountain, and the prospects are favorable for the development of extensive coal beds. In Esmeralda county, not far from Columbus, coal mines have been discovered and the coal is being used at Columbus and Candelaria for domestic purposes.

THE Argentine mines, South America, during the past year yielded, silver, 1,042,4920 pounds; gold, 22,462 pounds; and of copper 857,780 pounds, most of which was shipped to France, Germany, England, Belgium and Italy. The director of the Department of Mines and Geology gives it as his opinion that these figures are an underestimate. New and profitable mines are being located in many parts of the Andes and a renewed interest in mining displayed.

A BILL has been introduced in Congress by Representative Mondell, of Wyoming, to authorize the entry and patenting of lands containing petroleum or other mineral oils, under the placer mining laws of the United States. The bill provides that, in making application for the patenting of such lands under these laws, one bona fide discovery of petroleum or other mineral oil shall be deemed sufficient on any tract not exceeding 160 acres held by one individual or association.

A BILL proposed at the last session of the Colorado legislature that failed of passage is to be again introduced empowering a court, upon proper application, to order the sale of a mine when the owners fail to agree as to the best methods of operating the property. There was formerly such a bill in the statute books but it was repealed. Under the law as it now stands, if nine of the members of a mining company decide to make an assessment and go on with work the tenth member may refuse and block progress.

THE Pacific Coast Mining Agency has been formed in this city, with offices at 320 Sansome street, to act as agents for owners, sellers or purchasers of mining property on this coast, in connection with the management, sale or purchase of such property. Horatio Beveridge is the manager. It is the belief of many who have given thought to the subject that a responsible and trustworthy company of that kind is a necessity, and that, by due regard to present requirements, the new organization can insure itself honorable and continued existence.

NEARLY the entire edition of last week's issue of this paper was caught in the mailing room when the fire broke out on Commercial street in this city Dec. 25th, and was totally destroyed. Twenty-four hours after the whole paper was reset, printed and bound, and by night was in the post office ready for transmission to all parts of the world, one of the biggest and quickest pieces of work in the history of San Francisco journalism. For the success of the effort considerable credit is due John Young, the foreman of the MINING AND SCIENTIFIC PRESS printing office.

IT has been mentioned in several papers that the dredging of the Carson river was a failure and that the company was to be reorganized and the river flumed. The manager of the company states that there is no truth in this and that the dredging plant is a success as far as dredging the material is concerned. What has been an obstacle is to save the value in the material after it is taken from the river. To do this the company put an extensive concentrating plant to catch the sulphurets, and it has quite a lot of them on hand. To work these a leaching or cyanide plant will have to be put up and this is what the company proposes to do.

PROMINENT place in prominent newspapers is now being given an advertisement telling what big wages miners can get in South Africa. The advertisement says it is "furnished by leading mining companies." Of course transportation companies interested in carrying miners to South Africa have nothing to do with the announcement. As has been previously pointed out, such advertisements are to be discounted; no one should place much belief in them. No miner should think of going to South Africa unless thoroughly assured of work, that is, unless he knows just where he is going, at what wages and is fairly certain of his pay. To heed such speciously worded advertisements as those referred to would be to invite distress.

THE smelting industry in Utah is described as in a demoralized condition, due to keen competition, not only among the plants in that State, but those outside. A large amount of lead has been shipped out of the State in ores, and also considerable quantities of silicious ores. Freight is paid in cases on as high as 80 per cent of earthy matter in the ores to distant points. The exportation of lead in ores, as compared with bullion, reached its maximum in 1892, when it stood thus: Lead shipped as bullion, 47,552,010 pounds; lead shipped in ores, 43,565,097 pounds. In 1895 there was lead shipped as bullion, 36,326,549 pounds; lead shipped in ores, 34,455,700 pounds. The smelting works of Utah are introducing economical appliances of all kinds to meet the strife.

THE Committee on Legislation of the California Miners' Association has prepared a bill for presentation to the Legislature, to amend the act of 1893, creating the office of State Debris Commisssioner, and appropriating $250,000 for the construction of restraining barriers, so as to make the appropriation available. Its passage will be recommended by the Governor in his message. It extends the office of the State Debris Commissioner for four years from January 1, 1898, in order that the duties for which it was designed may be fulfilled, and excepts the salary of $300 a month, and that of the Secretary of the commission from authorization by the State Board of Examiners previous to payment. The remainder of the bill is intended to bring the requirements of the State and Federal appropriations into accord.

DURING 1896 more than 12,000,000 acres of public lands have been patented to the Northern Pacific railroad, the general land office having practically surrendered itself to this corporation. It appears that the Northern Pacific obtained four-fifths of all the land patented during the year, and the Huntington roads nearly the whole of the other fifth. Eighteen other land grant roads received but 177,979 acres. The territory transferred to the Northern Pacific within the year is greater than Massachusetts, New Hampshire and Rhode Island combined. In the thirty years previous to Commissioner Lamoreux's administration but little over 2,250,000 acres were patented to this company. These facts are said to have so startled Secretary Francis that he has notified the land office that he will approve no more selections of land by the Northern Pacific.

PRESIDENT KRUGER has established a rigid system of passports for those entering the Transvaal, which went into effect on the first of the year, and which it will be well for those intending to go there to study. United States Minister Quinby at The Hague has supplied the Department of State with a translation of the decree covering this subject at the request of the minister resident there of the South African Republic, and has requested also that publicity be given to its provisions in the United States, from which country many persons have gone to the Transvaal. The decree provides that foreigners entering the republic must have proper passports from their own government, duly vised by a consul of the republic. The passport must show that the foreigner has sufficient means of subsistence, or can obtain such by his work. Failing to have this passport, proper letters of identification may be accepted. Admission to the country will be granted by the field cornet at the place of entry, who will issue traveling and resident passports, good for three months' stay. These may be renewed, and foreigners desiring to settle must make oath to obey the laws. The decree does not apply to foreigners already in the republic.

"TOO MUCH technical matter," writes a Sierra Co., Cal., subscriber. "Not enough technical discussion," says a San Francisco mining engineer. "Why so large a quantity of general mining news?" asks a Colorado reader. "You should have more news from the different mining camps," writes a New Mexico miner. Thus it goes. The idea is to give the most accurate information, condensed. Consider these columns as a well-set table, with a complete bill of fare. You may not like pie, while your neighbor across the table yearns for it. He may dislike olives, while you insist on having them. Very well, the pie and olives are there, take what you desire; pass the mustard, please. It is manifestly impossible to suit all tastes; but the fact that all through '96 an average of 200 new subscribers were monthly added to the mailing lists shows well for the general appreciation of this paper which aims to fill the field. Meanwhile criticism, adverse and otherwise, is gladly welcomed. A good deal is expected of this paper, and justly, too, and one good way to improve it is to pay prompt and respectful attention to our readers' suggestions. But no one more quickly or regretfully notes the imperfections of a paper than the men who weekly make it, and their constant effort is to give as little cause as possible for complaint.

GEORGE C. ARMSTRONG, writing to the New York *Sun* from Broad Arrow, West Australia, states that in that colony for the month of August, 1895, the number of companies registered was sixty-eight and the total capital £7,019,610. In August, 1896, the number was fifteen; total capital, £1,875,753. But for the first eight months of 1895 the capital of the companies registered was only £19,229,215, against £28,829,215 for the first eight months of 1896. The total capital of the registered companies is £74,176,925, the population 120,000, and the output of gold for the first nine months of 1896 193,406 ounces. He says: "Add to the 193,406 ounces already produced 100,000 ounces for the rest of the year, and we have, say, 300,000 ounces, valued at £1,200,000, as the returns for £75,000,000 of invested capital, 20 per cent of which is working capital. An average of 50 per cent of the working capital, or £7,500,000, has been expended and £1,200,000, or a little over 2 per cent of the invested capital, has been returned. In consequence, the London public has paid Western Australia an 8 per cent dividend, instead of receiving one of 20 per cent from Western Australia, as was expected." A list of salaries paid to the consulting engineers and managers of the mines of two concerns with a joint capital of £4,000,000 is £36,500—ten men in all. In this connection Mr. Armstrong says: "Miners receive £4 per week. The above companies employ 100 men. By reducing wages to £3 per week the corporations would save £50,000 per year, but by reducing salaries one-half they would save £20,000, without the expenses of a strike. Manipulations are everywhere evident here. Vast expenditures mark every movement of companies. The roads are ground into powder by teams hauling machinery which will be put up on 'mines' that have no ore. South Africa in its worst aspects is more alluring to capital than this immensity of dark promises. Here, where no edible life exists and no water that can be drunk without condensing, the reefs will not yield as many grains as South African reefs will yield pennyweights. Capital invested here without prudence now seeks not to recover what it lost, but to keep what it still has. A few months will prove this mining boom the biggest swindle of the century."

The Solution and Precipitation of the Cyanide of Gold.*

NUMBER III.

By S. B. CHRISTY, Professor of Mining and Metallurgy, University of California, Berkeley, Cal.

II.—THE PRECIPITATION OF GOLD FROM CYANIDE SOLUTIONS.

Those who are familiar with the instability of most of the salts of gold, and the ease with which all reducing agents, and even light, precipitate metallic gold will be surprised at the tenacity with which gold is held in solution as aurocyanide of potassium. None of the usual agents can be relied on to precipitate it; sulphydric acid, oxalic acid, sulphurous acid, ferrous sulphate, etc., which are usually so prompt in precipitating gold, are of no avail here. So long as the cyanide of potassium is in excess, they give either not the least trace of a precipitate or only a very imperfect one. In order to have these agents act with certainty, it is necessary to destroy all the cyanogen present. This is a long and difficult process. My attention was early directed to the need of a certain method of recovery, for precipitation by zinc shavings was exceedingly inconvenient in laboratory tests. For a long time the only certain method that could be relied upon was either to evaporate the whole solution to dryness in a dish made of test lead, and to scorify the residue, or else to acidify the solution with sulphuric acid, and boil till copious fumes of sulphuric acid appeared and the gold separated out in the metallic state. The solution was then diluted, filtered and the residue scorified. The results were satisfactory, provided the evaporation was pushed far enough to destroy all the cyanide, and no chlorides were left in the solution. Otherwise the results were liable to be low. The extreme tedium of this method, even on a laboratory scale, led very early in the study of the solubility of gold to a parallel study of the causes that contributed to the opposite effect, viz., the precipitation of gold from its solutions. In reality, these are the two opposite aspects of the same question.

According to most of the authorities, when a solution of potassium aurocyanide is acidified with sulphuric acid, the cyanide of gold promptly separates as a yellow precipitate. From the solution obtained in treating a gold ore with a 1 per cent cyanide solution, even when it contains several hundred dollars' worth of gold per ton, nothing of the sort takes place. The solution remains perfectly clear and colorless. It is only when the solution has been evaporated down and the acid gets concentrated and hot that the canary-yellow aurocyanide separates out. If the acid gets stronger, this salt is gradually decomposed, and finally metallic gold remains. The cyanide of gold is more difficult to decompose than the telluride. For it is only the strongest hot sulphuric acid which will convert the canary-yellow crystals of AuCy into metallic gold.

The remarkable fact that the gold remains in solution after being acidified with a strong mineral acid, and that a precipitate forms only on the long continued application of heat, seems to show that a compound $HAuCy_2$, which I shall call aurocyanhydric acid, is formed, similar to the ferrocyanhydric and the ferricyanhydric acids; in short, that we have to deal with an acid radical of the same class as the two just named, and not with an ordinary double cyanide, AuCy, KCy, as is usually supposed. There are many converging indications pointing to this conclusion which it would take too long to enter into here.

1. Regeneration of Potassium Cyanide from Dilute Solution by Acidification.

Before this fact was understood, it was thought that the gold was kept in solution by the free HCy left in the solution after acidification by sulphuric acid. If this free acid could be removed, it was hoped that the gold cyanide would be precipitated. At the same time it was hoped that the free HCy could be regenerated by absorption in caustic potash. This subject was exhaustibly investigated in February to May, 1893.

It was found that, although when acidified with sulphuric acid, a 1 per cent solution of potassic-cyanide gave not the least apparent trace of escape of HCy, yet, if the solution thus acidified was left for several weeks near an open vessel containing caustic potash, nearly all the HCy would be absorbed by the alkali. As this operation was too slow to be of practical use, air was pumped first through the acidified solution and then through the solution of caustic. The same air was used over again to avoid the presence of carbonic acid. By using steam with the air, the contents of the stock solution in cyanide were reduced in three hours from 1 per cent to 0.07 per cent of free HCy. By using absorption towers (the usual means of increasing surface exposure) such results might be reached in practice without the use of steam. Similar results were reached, without the use either of absorption towers or of steam, in from eight to ten hours.

At the same time it was found possible to regenerate from a 1 per cent stock solution of cyanide, a concentrated solution of any desired strength of potassium or calcium cyanide, with a total of cyanide actually recovered, up to 80 or 90 per cent. The avidity with which caustic potash or lime absorbs the HCy reduces the loss to a minimum. In case the solution contains alkaline sulphides, these would have to be removed previously by treatment with lead carbonate or sulphate.

A method was thus found which, with a little engineering skill, can be used for regenerating solutions of cyanide of potassium.

2. The Precipitation of Gold from Aurocyanhydric Acid.

Although it was thus found possible to remove, down to 0.01 per cent, the free HCy from such a solution acidified with sulphuric acid, still the gold, even to the amount of $603 per ton, or 0.1 per cent, would remain in the perfectly clear, colorless solution. As already stated, the only explanation found for this was the presence of aurocyanhydric acid ($HAuCy_2$) in solution. It was found that, even under these circumstances (absence of all free KCy, and only a trace of free HCy), all the usual reagents, such as oxalic, sulphurous, sulphydric acids, etc., failed to precipitate the gold, either giving no precipitate or else only a very imperfect one.

Experiments were made as early as March, 1893, with nitrate of silver, nitrate of lead, and mercurous nitrate. A complete precipitation of the gold resulted when an excess of nitrate of silver was added, either to the above aurocyanhydric acid or to the corresponding potash salt. This would be a neat and practicable method on the large scale, if it were not for the cost of the silver. The nitrates of lead and mercury gave partial precipitation in most cases.

Oxidizing agents, such as permanganate of potassium and peroxides of manganese and lead in acid solutions, also facilitate the precipitation. The filtration of the solution through red lead or massicott has been covered by an English patent granted to P. de Wilde, December 22, 1894.

3. *Precipitation of Gold From Potassium-Aurocyanide by Means of Charcoal.*

On July 3, 1894, an American patent was granted to the late William D. Johnson, at that time chemist of the California State Mining Bureau, for a method of extracting gold from a cyanide solution by passing the solution through a series of charcoal filters, and subsequently burning the charcoal and smelting the ashes with suitable fluxes.

The use of charcoal for this purpose had already been tried for extracting gold from the chloride solutions produced in the Plattner process. For this purpose it is certainly a very efficient method of precipitating gold; but the subsequent extraction of the gold from the charcoal is almost as troublesome as the extraction of the gold from the original ore.

Dr. Johnson claimed that a single filtration would remove 25 per cent of the gold, and that, by repeated filtrations, 95 per cent of the gold could be recovered by a single filter, it would take a very large number of filters to remove all the gold, and, consequently, a large volume of charcoal would have to be burned to recover it.

In order to test the method, the following experiments were tried: Two cyanide solutions containing each 100 c.c. with about 0.1 per cent of gold ($603 per ton solution) were each filtered through separate filters, and the process was repeated four times. Each filter contained seven grammes of charcoal. One of the solutions was alkaline, the other had been made acid with sulphuric acid. From the acid one 15 per cent, in the other case 6.5 per cent, of the gold present was precipitated by the charcoal. These experiments, made under more favorable conditions than could occur on the large scale, show that this method can hardly prove of service with rich solutions in practical work.†

†Since the above paper was presented at the Denver meeting, I have been paying more attention to the action of dilute solutions, and I have thought it well to investigate the action of charcoal on such solutions.

For this purpose the following experiments were outlined: Two solutions of 2000 ccms. each were prepared. The one (a) contained 0.001 per cent gold as potassium aurocyanide, or $6.03 per ton, but no free cyanide of potassium; the other (b) contained the same amount of gold, but also 0.2 per cent cyanide of potassium. Each solution was contained in a Marriotte bottle 11.5 cm. in diameter, so arranged that the solutions were discharged upon charcoal filters so as to keep the charcoal constantly submerged, and under a constant head. The charcoal was crushed so that it passed a 20-mesh sieve, but was mostly fine dust. It was contained in a cylindrical glass tube 10 cms. long by 2 cm. in diameter; it weighed in each case (dry) 10 grms.

It took nearly two days for the first 800 ccms. of solution to filter through each filter. The filtrate from (a) contained no gold; that from (b) contained a trace—less than 0.01 mg. The next 1200 ccms. took nearly five days to filter. Filtrate (a) contained 0.01 mg. of gold, while (b) contained 1.40 mgs. The charcoal from (a) contained 20.03 mgs., while that from (b) contained 18.70 mgs.

The actual recovery of gold by the charcoal was in (a), in the absence of free cyanide, 99.95 per cent; in (b), in the presence of 0.2 per cent free cyanide, it was 93.03 per cent. The free cyanide in the latter case was reduced from 0.2 per cent to 0.118 per cent.

These results are of great importance, for they show that under certain conditions all the gold can be precipitated from gold cyanide solutions by means of charcoal, and that even in the presence of free cyanide of potassium 93.03 per cent can be precipitated.

Further study of the data given above shows that the charcoal in (a) contained 0.2 per cent gold or $1206 per ton, while (b) contained 0.187 per cent or $1182 per ton. These figures would seem to represent the limit of enrichment at which the charcoal ceased to act in either case, the limit being lower in the presence of the free cyanide. In the case of the strong solutions previously tested (which were 100 times richer in gold), the content of the charcoal in the acidified test was 0.21 per cent gold or $1266 per ton, and in the alkaline one, containing a certain amount of free cyanide, it was 0.091 per cent or $548 per ton.

These results would seem to show that Dr. Johnson's view that the charcoal can be depended on to precipitate 25 per cent of the gold content at each filtration is erroneous. It would seem, rather, that a given amount of a certain charcoal has a definite capacity of precipitation; that within that limit it acts completely and promptly; beyond that limit it acts less completely and more slowly, and that finally it ceases to act at all; that the presence of free cyanide of potassium lowers its precipitation capacity, and perhaps at a certain point stops it altogether; that acidification seems to increase its capacity. These views are of course provisional, the subject being still under investigation.

It must be evident that, in its present form, the method gives a much less concentrated precipitate of gold (only 0.2 per cent) than either the zinc, the electric, or the cuprous methods of precipitation described later. The precipitate in the latter case often contains 40 to 60 per cent of its weight in gold, or it assays from $240,000 to $360,000 per ton.

4. Precipitation of Potassium-Aurous Cyanides by Mercuric Chloride.

Fremy (*Encyclopedie Chemique, t. 2, Metalloides, p. 463*) states that potassium aurocyanide is precipitated by mercuric chloride according to the following reaction:

$$2KAuCy_2 + HgCl_2 = 2AuCy_2 + 2KCl, \ HgCy_2.$$

This reaction I have also tested. A solution assaying several hundred dollars per ton, and carrying only a trace of free cyanide of potassium, remained perfectly clear for several hours after the addition of mercuric chloride. The next day, however, I found a yellow precipitate of cyanide of gold, so fine that it filtered clear with great difficulty. When, finally, a clear filtrate was obtained, the gold continued to precipitate for several days; it also had a tendency to adhere strongly to the walls of the tube. These indications seemed to point to the need of heat to hasten the reaction. Consequently I tried heating the solution. I found that this greatly aided the reaction. On boiling the solution for a few minutes the gold was almost entirely thrown down as the yellow cyanide, and could be easily filtered out, leaving a perfectly clear filtrate.

In the filtrate from the aurous cyanide the mercury could be saved and the cyanide recovered by adding, very exactly, the amount of sulphide of potassium to throw down the mercury as sulphide. Cyanide of potassium would thus be regenerated in the solution. The latter would then be ready for another leaching; and even should a little gold be left in the solution from imperfect precipitation it would not be lost. The precipitated cyanide of gold, gently ignited at a low red heat in the air, turns to pure gold.

This method of precipitating may be useful under certain circumstances, but the necessity of heating the solution adds so many complications and so much expense to a leaching process that it is robbed of many of its advantages. In the presence of an excess of free cyanide of potassium this precipitation does not take place.

Some Cripple Creek Practices.

From Our Special Correspondent.

The milling capacity of this vicinity is as follows: Brodie, 80 to 100 tons per day; Metallic cyanide mill, Florence, 300 tons per day; Colorado-Philadelphia Reduction Company, Colorado City, 250 tons per day; Gillett Chlorination mill, 40 tons per day. Thus it will be seen that the cyanide and chlorination plants, which are running on Cripple Creek ores chiefly, have a capacity of over 600 tons per day. The output of the district may be expected to increase, and it is not unlikely that the mills will soon treat a larger proportion of the output than they are now treating. It is estimated that while the smelters have not handled half the tonnage of Cripple Creek ores, they have handled over half the values. As milling facilities become greater, and processes of treatment more perfect, the ore reserves of medium grade, found in the mines and on the numerous dumps, will be milled and their values saved. It is observed that, especially on Bull hill, there are thousands of tons of ore on the dumps, much of which is said to run as high as one ounce per ton in gold. Mills, situated as are those at Florence and Colorado City, are, of course, in position to handle ores from all parts of the country, and while their principal supply may be expected to come from this district, they will not be wholly dependent upon it. In the meantime plans are being perfected for the construction of additional chlorination mills in this district.

The Leasing System.—Those who have had experience as lessees in other mining districts find themselves somewhat handicapped by practices in vogue here. In the Leadville district, for instance, the usual term of a lease has been about five years. In Cripple Creek the term is generally one year and in a few instances two years. The royalties exacted are unusually high, which with the short life of the lease makes the proposition less attractive than in some other camps. When it is recalled that many of the big mines of the district were opened up by lessees, when the owners didn't have the nerve to go ahead, the importance of a satisfactory leasing system, as a district promoter, will be recognized.

Closely associated with the condition named is the matter of prices at which properties are held. There has been a certain glamour about the district which

placed a highly speculative value upon acreage, within the recognized district, which had no developments, proving absolute mineral value. This status of affairs has brought about the condition unfavorable to lessees and has indirectly kept down the number of men employed below what it might have been. Under a favorable leasing system fully double the present number of men would be employed in the district. Mr. Stratton, of the Independence, always prompted by generous motives, made purchases of properties, after the Independence became a bonanza, at figures which served to create a precedent for prices in the district. But the figures at which undeveloped properties have since been held are believed to have kept investors out in many instances.

While Cripple Creek is noted for the large number of individual fortunes made in the district, there is beginning to be seen a tendency toward consolidation and the gathering in of large areas by companies, whose management gives little encouragement to lessees, but who pursue a waiting policy which does not foster rapid development.

In reference to the number of men employed in the district, consideration must be given to the fact that in a camp of such high-grade ores as are found here, the tonnage output is far less than in such localities as Butte and Leadville, and the labor requirements correspondingly less.

Tunnel Enterprises.—There is little doubt that within the next year or two there will be several completed tunnels in the district which will greatly promote mining operations in the several hills of the camp.

The Moffatt-Bush tunnel, entering Gold hill just below the town of Cripple Creek, is in about 2500 feet, takes an easterly course, cuts about 300 feet below the present Anaconda workings and is designed to cut through Raven hill in the vicinity of the Morning Star and through Bull hill, coming out on the ground of the Victor mine. In pushing the work a strong flow of water was encountered, amounting at present, at the mouth, at about 45 gallons per second. As a result, the water supply in the various mines on Gold hill is seen to be perceptibly less than formerly. Work on this extensive undertaking is at present closed down, the first contract having been finished. The ability and standing of the projectors of the enterprise would seem to be a guaranty that the enterprise in due time will be made a success.

The Uintah tunnel, located in 1891, and one of the earliest in the district, enters Battle mountain in Arequa gulch, its objective point being the Portland group, and the breast is now in 900 feet. Its location is said to be prior to all claims in its course excepting one. It will cut the Portland ground at a depth of about 600 feet. Among the properties on its line are the Eclipse, Dead Pine, Granite, Baby Mine, Coriolinus and Ocean Wave.

The Columbine-Victor tunnel is a Squaw mountain enterprise and work is being driven from both the east and west ends. At the east end, near Victor, the work is in 700 feet, size 7x7 feet. On the west side it starts from Arequa gulch, and present workings are in 1000 feet. This tunnel will cut the Nellie V. vein and the M. K. & T. at a depth of from 400 to 600 feet.

The Squaw mountain tunnel starts on the northwest slope of Squaw mountain and has been driven 1500 feet and is said to have cut six veins. This tunnel has no doubt fully paid its way thus far. It is under bond and lease to Malony & White, the bond being for $200,000. The last ore shipments returned $250 per ton.

The Chicago and Cripple Creek tunnel is driving from Poverty gulch, above the Arcadia mine, into Gold hill, and is in 1200 feet. Some drifting is being done on veins exposed. Work is being pushed 15 feet a day with air drills. The Lelia is being worked in connection with this.

The Raven Gold Mining Company is developing its extensive holdings on Raven hill by some important tunnel work. One from Anaconda gulch runs toward the Gregory shaft, having reached a point 1150 feet from the mouth. Four hundred feet more will take it to the Gregory shaft which it will intersect at about 670 feet. The latter shaft is being sunk and is down 300 feet. This company's Raven tunnel starts in from the Elkton side of Raven hill and cuts above the one from Anaconda gulch. Its workings are in 1200 feet.

The Ithaca tunnel cuts through the saddle between Battle and Squaw mountains, and takes a northerly course toward the Necessity, on Battle. It has been driven about 1400 feet.

Work is likewise in progress on the Battle Mountain tunnel; the Standard, on Beacon hill; the May Bell, on Battle; and the Gold Dollar, on Beacon, the last being in about 900 feet.

A large number of tunnel enterprises have been projected, the utility of which are decidedly problematical, excepting in so far as the sale of stock may inure to the advantage of the promoters. Tunnels which are projected with the co-operation and the contract consent of the property owners on a given mountain, mainly for drainage and transportation purposes, are of practical utility, and with sufficient capital behind them are capable of being successes, and are destined to promote genuine development; but it is very doubtful whether those located for the purpose of taking advantage of the tunnel law as now construed, and depending upon the possibility of discovering blind leads, are not apt to have sufficiently smooth sailing to enable them to become financial successes. The law looks plausible, but the trouble is that the body of a mountain is not transparent, and no one can tell whether a supposed blind lead is really one or not; and the surface claimant who has discovered a vein is very likely to enjoin the tunnel projectors if he have grounds to suspect they are on his vein. Other surface claimants would do likewise, and the result would be that the tunnel people would be constantly tied up. The point is that the few tunnel schemes which have been successes are those which have had the co-operation of the surface claimant, instead of their antagonism. Those mentioned in this article are located either largely on their own ground, or have acquired contracts with the surface property owners.

WASCOTT.

Cripple Creek, Colorado, Dec. 18, '96.

Certain Stamp Mill Practices.

Written for the MINING AND SCIENTIFIC PRESS by JAMES W. ABBOTT, M. E.

In California the modern stamp mill had its origin. Here every feature of its construction has been patiently studied and intelligently elaborated. Many of these mills, in their mechanism and operation, are models. In some, where the practice is in the main good and the results satisfactory from a dividend standpoint, there is a disregard of certain details, the importance of which is either not recognized, or ignored.

One of the most essential principles of mill practice is to maintain as nearly uniform as possible every condition, which, from experience, has been determined as yielding the best results. If, for instance, experience has proven that in a certain mill, on a certain class of ore, a six-inch drop is to be preferred, some loss must follow a material departure from that condition in either direction. Some definite height of discharge is best suited on a particular ore to the other determined conditions of parts, drop, speed and amalgamation devices.

Reason indicates and experience proves that the contact faces of shoes and dies should be planes, parallel to each other and normal to the sides. When new they are so, and there is complete contact at every position of the shoe. It is very important that this relation shall be preserved during the life of both. This can generally, and I believe always, be approximately insured, with proper crushing and feeding, by a judicious selection of material for their construction. But in determining this question other considerations must not be overlooked. The more rapid the wear of shoes and dies, the more frequent must be the adjustment of tappets to maintain a uniform drop. The most nearly fixed unit of expense in milling is the cost of a day's run, and, of course, it is desirable to keep the stamps dropping with as little intermission as is consistent with the best average of all conditions practiced.

Many mills adopted the chrome steel shoes and dies because they were harder, lasted longer, crushed more ore, and consequently required less frequent adjustment of tappets than any kind previously offered. But these, while they unquestionably marked an epoch in stamp-milling, have not been found to give universal satisfaction, when used together. As they wear down, the faces, particularly of the dies, often become increasingly irregular and uneven. Many mills have found, in practice, and all authorities advise that the best results so far have been obtained by the use of a die softer and tougher than the shoe. Most mill men, who have used them, are loth to relinquish the advantages of durability offered by the chrome steel shoe, but they frequently seek a die of some material more likely to wear with an evener face. The experiments on this line have been varied and interesting. In the list are chilled iron shoes and unchilled dies; cast iron shoes on wrought iron dies; chrome steel shoes on cast iron dies; chrome steel shoes on Bessemer forged steel dies. Where there are local foundries which will utilize the scrap, some mills use chrome steel shoes and dies cast from a mixture, ascertained by experiment to give satisfactory results in their practice. Some throw a die into the scrap heap as soon as it begins to show signs of wearing unevenly. The representative mills in the Black Hills have concluded that they get best results from the products of local foundries for both shoes and dies. The character of their ore and their practice in its crushing probably has much to do with these conclusions. Certain San Francisco manufacturers are offering to the industry a hammered steel product, which may probably best answer the conditions in many localities, either for dies alone, or perhaps for both.

Another important condition to which I have referred is a uniform depth of discharge. The tendency of this to increase as the die wears down must be offset. This result has been reached in many ways. Cast iron plates (objectionable because they break), the remnants of old dies (objectionable because they wobble) and wrought iron plates have been inserted beneath, to raise the dies. Strips of iron, or wooden cleats, have been placed outside, covering to a certain height the bottoms of the screens, against which to that height the pulp inside backs up, until these strips are removed to compensate for the wear of the dies. In some mills one and sometimes two screens are kept, interchangeable and reversible, in which the bottom strips are of varying widths, and by their selection and position regulate the height above the dies of the screen openings. The tendency of the pulp within the mortar to escape upon removal of the screen is an objection to any practice that unnecessarily increases its depth. Three thin iron strips have been inserted flatwise, one upon the other, under the screen frame, to be consecutively removed as the die wore down.

When inside amalgamation is sought wooden chuck blocks of different heights are often used. A chuck block is made from two strips of plank, with their faces bolted together. Number one of these strips, whose width determines the height of the chuck block, is simply a false bottom for the screen frame. Number two overlaps the upper edge of number one, and this overlapping portion coincides in width with and presses against the bottom of the screen frame on the inside. To the rear face of number two, which has its upper inside corner rounded off, is attached a strip of copper plate. Some mills use two chuck blocks of different heights. Others use these two chuck blocks in connection with wrought iron plates, starting when the die is new with the higher chuck block and changing to lower as the die wears down. At the first general cleanup the plates are inserted under the dies and the higher chuck block resumed, to be again succeeded by the lower in the final stage of the die's use. In this practice the thickness of the plate should be just half of the full amount to be worn off from the die, and the difference in the height of the chuck blocks one-half of the thickness of the plates. The actual heights of the chuck blocks should be such that when the die is new and the high block in place the depth of discharge should be half of the amount by which the blocks differ less, and just before the first change the same amount more than the average desired. If the general cleanups are so timed as to come at the beginning, middle and end of the life of the die, the above relation of plate and chuck blocks will insure very closely the uniform average depth aimed at, without too serious variation between the positions of the face of the die with reference to the bottom of the plate on the chuck block, a very important desideratum in amalgamation, and one too often overlooked. If these intervals, though periodical, are not so timed, then some other relation between dimensions in chuck block and plates, easily determined, may better fit the conditions.

The other dimensions of the plates should be such that the set will fill the same space beneath the dies, with play enough for easy removal and each piece be not too heavy for convenient handling.

Where inside amalgamation is considered unimportant, undesirable, or unattainable, the thin iron strips under the screens probably give the desired result with as little trouble as any method.

Of course most mill men are familiar with the literature of the industry, but possibly some who read this article may be pleased to know where they can inform themselves more fully on the above and other details of their profession.

An article by John Hays Hammond in the 1888 Report and Bulletin No. 6, by E. B. Preston of the State Mining Bureau each treat on gold milling in California. The Trans. of the Amer. Inst. of Min. Engineers contain articles on gold milling by Raymond, Vol. 1; Munroe, Vol. 9; Bowie, Vol. 10; Rogers, Vol. 11; Egleston, Vol. 12; Hofman, Vol. 17; Abadie, Vol. 24; and Rickard, Vols. 23, 24 and 25. Nearly all of these have been republished by the MINING AND SCIENTIFIC PRESS. Treatises on gold milling and metallurgy have been written by Eisler, Rose and Louis and a work by Rickard is now in press.

North Carolina Gold Mines.

There are several hundred gold mines in North Carolina which have been worked with varying success ever since the first discovery of a number of valuable nuggets in the county of Cabarrus more than one hundred years ago. During the past few months a great deal of gold mining property has changed hands, and experienced miners are going into the State for the purpose of renewing work in some of the old mines with modern mining appliances and machinery.

Two of the largest mines in the State, both located within two miles of Charlotte—the Rudisill and the St. Catharine—are now having the water pumped out of the shafts, and extensive preparations are being made to again push the work on a more extensive scale than ever before. The Little Fritz Gold Mining Company, organized under the laws of Colorado, has bought 150 acres of land in Cabarrus county.

Then there are a number of Eastern capitalists and Western miners in the gold districts examining properties.

Mining Summary.

CALIFORNIA.

Amador.

VOLCANO DISTRICT.

(Special Correspondence).—The Azalea Mining and Milling Company of San Francisco has lately come into possession of the Dane and Mitchell mines, a half mile below the Reward mine, on Grass Valley creek. The company has just completed the rebuilding of the old Dane mill of ten stamps, and will be ready in a few days to crush 20 to 25 tons of rock per day.

Messrs. Thomas Day and Son, of San Francisco, are driving a tunnel to reach a large ledge of promising rock on Grass Valley creek, half a mile below the Azalea Company's mill. The work is superintended by Mr. J. R. Smith.

The Woodpecker claim, on Grass Valley creek, has about 100 tons of milling ore on the dump, which will probably be treated at the Azalea Company's mill.

The new 5-stamp battery recently added to the Reward 5-stamp mill is working satisfactorily, and Mr. James, the superintendent, alleges his ability to mine and mill the Reward ores at a cost of $1 per ton.

The Messrs. Gillick, of Volcano, recently discovered what appears a rich vein of good quartz, near Sutter Creek, northwest of Volcano.

Some of the old abandoned mines in the Volcano district have been recently under expert examination, with a view to reopening a number of them.

Considerable of a stir is observable about Oleta, in this county, due to the fact that a party of gentlemen have lately bonded a considerable area of the auriferous gravel, and propose to place the property with an English syndicate.

Pine Grove, Cal., Dec. 31, '96.

Ledger: The shaft at the Union Consolidated is now down 480 feet. Twenty stamps are being run on the Gouge ledge at the 300-foot level. They are running a level for the Gouge ledge at the 400, now being in about 60 feet. They expect to encounter it in a few days.

Superintendent Purrington, of the Gover, has taken the water out of the shaft, and resumed sinking. They have encountered a good ledge, and will start five stamps on it within a few days, making a test crushing.

The El Dorado mine, the property of Charles Wryon, has been sold to Louis Sloss, of San Francisco, and others, and timbers and machinery are being put on the grounds to resume sinking.

The Amelia Company has been incorporated for $2,000,000, to operate the Hoffman field, the property of Deter and Hoffman. They are arranging to prospect the ledges which run through the Alma shaft.

At the Pocohontas orders have been given to sink 1000 feet before prospecting the ledge. The new machinery for hoisting is on the property, and was started up this week. It is of capacity sufficient to sink 1500 feet.

The milling test of Argonaut ore at the Zula mill has proven satisfactory. While drifting between 240 and 250 feet north from the shaft on the 1250-foot level the workmen ran into some old works, probably a south drift from the Kennedy mine. This was encountered at a point about 25 feet inside of the line which the Argonaut claims as their north boundary.

H. W. Tangerman, who has charge of the Lombard mine, has constructed a 20-ton mill, and is now milling good rock from a thick ledge, which averages about $12 per ton. The present milling plant is experimental, and will be supplanted by a larger one as soon as the ore body is sufficiently developed.

Dispatch: At the Oneida the shaft is down over 650 feet, and sinking is being pushed as rapidly as possible.

At the Muldoon quartz mine, located on the same ledge as the Argonaut and Kennedy mines, a shaft has been sunk 125 feet on the lead, and the quartz in the bottom was wider than the shaft.

At the Good Hope they are taking out some good-looking ore, and the 5-stamp mill is kept running night and day. There has been no clean-up at this mine yet.

At the Red Hill Milling and Mining Company's property the 10-stamp mill is crushing from forty to forty-five tons of rock daily. The rock is mostly decomposed quartz, carrying a lot of free gold, but heavily impregnated with sulphurets.

Butte.

Mercury: The Pete Wood mine, one of the number owned and operated by the English syndicate, George H. Evans, general manager, is located on the east side of the Forks of Big Butte. E. C. Paxton is superintendent, and employs thirty-five men. They have a tunnel into the mountain, on the bed rock, a distance of 940 feet, and gravel is encountered which pays fairly well. The superintendent is expecting to tap a main channel that will narrow down and afford a larger yield of coarse gold. The drift at present covers a breast of 90 feet.

Register: The Magalia mine is working a crew of from forty-five to fifty men. This does not include the men who are chopping wood and getting out timber.

The tunnel at the Indian Springs mine is in 1500 feet.

Mercury: At the Magalia mine forty-five men are employed. All machinery above ground, including the air compressor, is run by water power, while compressed air is the power employed for all underground machinery.

Calaveras.

The Utica mine puts about $35,000 in circulation in the vicinity of Angels each month.

Prospect: In the Jenny Lind district the Mountain King mine, in Salt Spring Valley, is down 210 feet, showing a 4-foot vein of rich sulphureted ore.

The Live Oak mine, near by, is in a talc-slate formation, and shows much free gold in places.

Angels *Voice:* Huston and Mercer have leased the Codrington mine in Purdyville, formerly the Dead Horse, and have extended the tunnel about 20 feet. This tunnel was first opened in 1858, and is still in good condition.

The tunnel at the Calaveras Consolidated is retimbered for 1215 feet, and for the last 40 feet has been cutting the vein transversely.

Chronicle: At the Emerson mine, near Mokelumne Hill, a double compartment shaft is being sunk between the two parallel ledges which are about 100 feet apart. The machinery on the mine is capable of sinking to a depth of 1000 feet.

The Pellaton placer and quartz mine on Tunnel Ridge, near Mokelumne Hill, is bonded by C. H. Pfeiffer to San Francisco parties, who will sink.

At the South Paloma the shaft is now down 330 feet. It is the intention to sink 600 feet, when a station will be cut and the work of crosscutting the vein commenced, but the work of sinking the shaft will be continued to a depth of 1000 feet.

Calaveras and Tuolumne.

(Special Correspondence).—The Norwegian, just across the river at Robinson's Ferry, in Tuolumne county, has been sold to owners of the new bank at Sonora, for $25,000. Moffat & Cleveland are looking for something for Eastern connections and they are still in the neighborhood of Sonora.

The California Ophir mine at Carson, just down the hill from the celebrated Morgan mine, has been sold to Eastern parties. Mr. McMullen examined it last week and endorsed it. It has been kept out of the market for these many years by the extreme price asked for it. It looks as if there was a hitch in the sale of the Bald Hill again. It is a good mine and why it has not been sold is an enigma. Frank Baumhogger has his new hoisting engine in place on his mine just above the Utica, and from the results he is getting from his rock and its location, if he does not find buyers before long it will surprise me. The new shaft on the Utica is going down nicely, 100 feet to date. They are working three drills in the shaft, which is 17 feet in the clear. This shaft is being sunk just 280 feet from Mr. Tryon's mine, which about insures the sale of it to the Utica for $75,000. Chas. Tryon on the Ghost mine has got into such hard rock in his shaft that he is looking around for a compressor and power drills. The Santa Anna have put an extra drill in their shaft, being stimulated to extra exertions by the work being done at the new shaft of the Utica. I hear the French expert has turned down the Chapparal Hill property, but am not prepared to believe it.

We look for lively times along the lode after the 1st. Tuolumne county seems to have the pull now. From the Stanislaus to Stent along the lode there are signs of good times ahead. What we want on this side of the river is for some deserving company like the Santa Anna to strike it rich and then the faint hearted here will take hold. That company is mining like they do at Jackson in Amador; they are going down 500, 600, 700, 800 feet, before looking for a mine. Another thing which militated against Angels is the idea that has gone abroad amongst mining men, that the Union Water Company, controlled by the Utica Company, will not furnish water to other companies. This is untrue and unjust to the Utica Company. I am told positively that the water company will furnish all the water asked for by those who have the money to pay for it and they are ready at any time to put in an electric plant at Murphys, getting their water power to supply it from Coyote creek and supply the electric power to responsible parties. These facts ought to be more generally known, as many influential men have told me they could not recommend properties around Angels as water could not be had. Independent of the present company, if any parties want to operate mines in this vicinity there is ample opportunity to get all the electric power they want from contemplated plants on the Stanislaus. Mr. E. K. Stevenot, the engineer and mine owner here, has made all arrangements for a 200-H. P. plant on the river.

Angels, Cal., Dec. 29, '96.

El Dorado.

(Special Correspondence).—W. O. Frost and Rollin P. Saxe have purchased the Skinner & Lemon mining property, situated one mile north of Placerville. This property has been worked for many years from time to time, but to no greater depth than 45 feet. From a space 1700 feet in length $80,000 have been gathered through mortar process. Mr. Frost will be superintendent, beginning work Jan. 6th, running a 280-foot tunnel to intersect the diabase footwall. Then he will drift and sink deeper. A mill will be erected as soon as conditions warrant. Work will be prosecuted day and night.

At the Larkin mine a new shaft on the east vein has reached 55 feet on a 5-foot ledge of good milling ore. The new 5-stamp mill is in continuous operation.

Over at Greenwood development work is actively pursued on a large scale and considerable capital is being invested.

At the Landecker gravel property, two miles south of town, the tunnel has reached 1700 feet. One upraise of 40 and another of 50 feet have been made. The gravel looks quite promising, and it is expected that a 10-stamp mill will soon be in operation.

Mr. Thacher of Toledo, Ohio, one of the owners of the Big Sandy, is visiting the property. He contemplates placing a larger pipe line and actively pushing the work both of sinking and drifting.

B. F. Lloyd of Oakland, who recently bought the Gardner and Noyes claims, one mile north of town, is crowding development work rapidly. Seven men are employed. The shaft has reached 60 feet. A tunnel has been started that will be driven a distance of 450 feet, reaching "backs" of 250 feet. Machinery will be placed this week to operate power drills.

Placerville, Dec. 29th, '96.

Inyo.

Register: At Casey the New Years claim at the southerly end of the Inyo Gold Mining Co.'s group of mines is showing up remarkably well. Five or six large chimneys of fine ore were exploited and mined to the canyon's level without exhausting them, years ago. Two tunnels started on the vein show up large ore bodies.

At Darwin work has been commenced on the Lane mine with a force of eight men. The new shaft will be sunk 50 feet deeper.

Mr. Garlick of the Argus Gold Mining Co. is putting up cyanide works at the Snow's canyon mill.

Mariposa.

Gazette: The Rollins mine at Sweetwater, which has been bonded to Gage, Wallace and Smith of San Francisco, was sold this week to the parties named in the bond by the Revels brothers.

Nevada.

(Special Correspondence).—The Bullion mine will erect a 20-stamp mill in the spring, and the plant will be run by electricity.

The Brunswick mine is preparing to put in electric power.

Herald: The San Franciscans who bonded the Kirkman mine last year have, under the direction of Superintendent John M. Buffington, opened up about 1500 feet of ground. Last April they started a crosscut which they ran 300 feet in tapping the ledge. From this a drift was run eastward, where a first-rate body of ore was struck. Continuing for 500 feet another shoot of ore was struck. This was in September last. They have now drifted 200 feet on the ledge, and it looks better and better as they get into it.

Williamson and Cole have bonded their mine, the Giant King, at Washington, to Wm. S. Bell of Oakland. The Giant King ledge is an immense formation of low-grade ore.

Plumas.

National-Bulletin: At the Claybank mine, near La Porte, several men are employed in running the main tunnel ahead to reach the gravel deposit tapped by an upraise several months ago.

At the Thistle Shaft mine seventy-five men are employed. Until recently there has been a supply of water to wash all the gravel hoisted, 250 carloads per day. From now until spring opens gravel will be stored in the large dump provided for such purpose.

San Bernardino.

Dale is a new postoffice at Virginia Dale mining district.

Independent: Don Palmer of St. Louis and others have gone in to develop the Van Slyke mines, eighteen miles southwest of the Needles. The ledge shows an average width of over 50 feet for a distance of 1000 yards or more. Assays from the surface rock returned $6 a ton. Two or three thousand dollars will at once be spent in crosscutting the vein and other development work, and if all goes well an 80-stamp mill will be put up.

Shasta.

Free Press: At the Princess hydraulic mine, near Muletown, the ditch will be opened from Boulder creek to the mine in about two weeks. The great pipe syphon, which is 2000 feet in length, will be put in at the crossing of Clear creek as soon as possible.

Courier: At South Fork the people who bonded the Hope have 200 feet of tunnel completed and have let a contract for 200 feet more. This will take them to the old works and 100 feet deeper.

Nichols & Robinson are running a crosscut on the Manzanita fraction.

The ditch for the Princess Company is about completed and they will be ready to wash gravel next month.

Siskiyou.

Journal: The Erno mill, at Mugginsville, has been in operation for two weeks, and the owners have opened up two ledges. In the past the greater part of the ore taken from the ledges around Quartz Valley has been crushed in arrastras.

At the Glen Ellen mine, in Quartz Valley, they are now down about 85 feet, and expect to sink the shaft over 200 feet. Theirs is the only compressed air plant in Siskiyou.

The owners of the old Shinar, or Nanetta B. mine, have the pipe laid across the river now, and will be ready to commence operations in about three weeks.

Reporter: Down on the Klamath there are many notices of new locations. Old works are being put into order for operations in the spring. The Minnie Placer Mining Company and the Dr. Simmons Company, near Nolton, are preparing for work. So is Dr. Dean, near the same place. The Simons Company are building a suspension bridge over the Klamath to carry a water pipe to their mining works on the left bank.

Journal: The hydraulic mines all over Siskiyou are starting up, and will be kept in operation from now until next summer. In the Salmon river country, and along the Klamath, some large plants have been put in during the past few years, which will largely increase the output of gold in this county.

Mining operations will be commenced at the big hydraulic mines in Oro Fino, immediately after the holidays, unless the weather should be too cold, which would result in stopping the flow of water.

Tuolumne.

Union-Democrat: The Seminole group of mines which have been idle for three months past, will be worked on a larger scale than heretofore. A new company has been organized to take hold composed of California capitalists in the main, though some English capital is invested. Soon after January 1st, active operations will begin.

The Golden Gate employs seventy-three men and is working on good ore.

At the Confidence the new mill building is ready for the 20-stamp machinery.

At the Dutch the work of enlarging the present shaft is being prosecuted.

At the Mammoth the additional five stamps are in place and a rock crusher and four concentrators are being put in.

At the Dead Horse the mine has been pumped dry and good grade ore is being mined and treated at the mill.

Yuba

Marysville *Democrat:* Only a short time ago an old lode claim near Frenchtown, in this county, was bonded by a couple of practical mining men for $20,000, and now the work of development is going on.

Two claims near to Strawberry Valley, in this county, have been bonded at figures above $20,000, and both are being prospected; at the same time there are a dozen more claims in the same vicinity lying idle. No better investment could be made to attract attention to this county than the formation of a company, and the contribution of money with which to prospect and advertise the mineral resources.

NEVADA.

Reno *Gazette:* In Humboldt county there is more assessment work going on than has been for years in both gold and silver properties.

The Golden Chariot mine at Dun Glen, recently purchased by Callahan & Carlick, is in operation under the new management. They are running a patent mill, but it will be replaced by a 10-stamp mill the latter part of the month.

The Blackbird, a gold mine, twelve miles north of Mill City, owned by Michigan capitalists, will resume operations next week. The mine and mill were closed down about three years ago on account of bad management. At the time operations on the mine were suspended, a tunnel was being run to tap the ledge. Work will be resumed at once on this tunnel, which will tap the ledge at a depth of 80 feet below the lowest workings.

In the Wilbur group of mines, situated twenty miles north of Mill City, in Central mining district, the ore contains gold, silver and lead, and is shipped to the smelters. Mr. Wilbur is working eight men at present. He expects to dispose of the property to a French syndicate, whose representatives are now on the way here to examine the property. He holds the group of mines, consisting of five claims, at $150,000. He purchased the property one year ago for $5000, since which time he organized a company and has spent considerable money in developing it. It has more than paid for itself already, and is in excellent condition for the market.

The Nevada National Nickel Company, of Cottonwood, Churchill county, will start up its electrical plant next week. The Nickel Company has spent a large sum of money in an electrical plant for reducing the ore, and, if the experiment is a success, regular shipments of ore will be made.

Winnemucca *Silver State:* A strike of gold ore, assaying high, has been made in the Oest mine at Silver City.

Walker Lake *Bulletin:* Fifty tons of ore from the Bounce mine, in Silver Star district, milled by the Douglass Company last week, yielded $35 per ton. The mine is the property of Lothrop, Pepper & Davis.

De Lamar *Lode:* At State Line district the Rice brothers will soon put on two shifts of miners. Ore that can be handled has been struck, and is believed to be in paying quantities.

Notwithstanding the many discouraging obstacles that have to be met with, development work is progressing throughout the camp, a majority of the mines sending up ores that will not pay to ship, but which will return profits to the owners when our mill, which is promised to be ready for ores May 1, 1897, shall have been completed.

Lyon County *Times:* The Succor mine in Silver City, formerly owned by S. Longabaugh of Empire, has been sold to James, Taylor & Deitrich for $10,000. The mine in years past has produced good ore.

Elko *Free Press:* Another copper strike has been made at West Camp, on the Star of the West. The ledge is 8 feet wide.

The Ben Hur Mining Company of Granite district, recently organized in Salt Lake City, want to erect a 10-stamp battery on the stream at Campbell's ranch.

OREGON.

Baker City *Democrat:* The following mines in the gold fields east of Baker City will be equipped with mill plants early in the new year: Flagstaff, Con. Virginia, Columbian, Perry and Rachel. In other districts mills are contemplated, and the outlook is very promising.

Grants Pass *Observer:* The Lewis ditch, built to work mines near Leland, has been completed, and as soon as the pipe is placed in position, piping will begin. A large number of men have been employed there for several months past.

C. M. Howard has consummated a deal for the purchase of the old Lane black sand mine, near Randolph. He is associated with other San Francisco men, who will at once begin active operations. In testing the sand Mr. Howard found it contained as much value in platinum as it does in gold.

JOSEPHINE COUNTY.

Mr. Bates, representing the Standard Oil Co., is again at Riddle and new developments are expected in the Nickel mine sale. The company is preparing to erect big steel works

at Chicago in order to compete with the Carnegie company, and they need the nickel to use in the manufacturing of steel. What seems to be causing some delay in the consummation of the deal is the mixed title to the old mine, upon which the International Company partially erected a plant a few years ago, and which Mr. Bates' syndicate wishes to utilize.

WASHINGTON.

Spokesman-Review: J. J. Malone has closed a deal for Eastern capitalists for a controlling interest in the properties of the Burton Gold Mining and Smelting Company, located on Grouse Mountain, just south of the international boundary.

BRITISH COLUMBIA.

Spokesman-Review: At Lowry, near Illecillewaet, there is being put up a 200-ton concentrator for the Lillooet, Fraser River and Cariboo Gold Fields Company (limited) on the Lanark group of claims. The ore is silver-lead, which will run 65 ounces of silver and 75 per cent lead.

The Novelty Mining Company has given an option on a controlling interest in its property to a London syndicate for $200,000, the option to expire on January 1. The Novelty is on Red mountain, not far from the Le Roi.

The machinery at the Hall mine is in place, and is sufficient to handle over 200 tons of ore per day. The lower tunnel is in over 600 feet, and it is expected the first large body of ore will be reached in a few days. The tunnel, which is a double-tracked 9x8 working tunnel, will be continued about 500 feet more.

British Columbia *Mining Journal*: It is expected that a ditch, to carry 2000 inches of water, will be run from Baker creek, opposite Quesnelle, to the property of the Menominee and Maranette. The distance will be about ten miles.

Trail Creek *News*: The Ram's Horn claim, north of Fort Steel, has been bonded to Montana parties. It was located last summer by Grundy and Sprague, and is a silver-lead proposition. Mr. Sprague reports that the bond is for $50,000.

The North Star Company will take out from 6000 to 8000 tons of carbonates during the winter. They will ship nothing but carbonates next season, as they run from 90 to 100 ounces in silver, with a small percentage of lead.

Rossland *Miner*: The Noonday Mining Company has been organized, with $1,000,000 capital, to work that property, near the Hall mines.

The shaft of the Palo Alto is down 80 feet, with 3 feet of good ore in the bottom. The ore will assay about $30 in gold.

John S. Baker, the principal owner of the I. X. L., announces that the mine will at once be equipped with a compressor plant, and that a 10-stamp mill will be erected at an early date.

Plans and specifications are being made for a steam hoist and 4-drill compressor plant for the Sunset. The shaft, now down 40 feet, is to be continued by hand.

UTAH.

Salt Lake *Tribune*: The West Dip at Mercur has been followed up by Hartwig A. Cohen, general manager of the Golden Gate and other De Lamar properties; 12,000 feet along the strike of the vein are covered by his stakes. Mr. Cohen believes that the zone which has been punctured in the La Cigale and Omaha continues into Rush valley, and to demonstrate it work will begin in a very few days through a shaft.

At Bingham it is proposed to put up a plant that will enable the owners of low-grade ores to convert them into a matte and in that form handle them at a profit.

At Mammoth the hoisting machinery is on the ground for the Mammoth hoist, and it will be in operation in sixty days. Several new bodies of ore have recently been opened up on the lower levels, and one body on the 1500-foot level is reported to run as high as 91 ounces in gold.

Tintic *Miner*: At the Humbug a new ore body has just been opened up showing about 18 feet of solid ore. The work on the lower tunnel still continues.

A certificate of the incorporation of the Tintic Mining and Development Company has been filed. This company was incorporated in West Virginia in August of this year with a capital stock of $1,500,000 to continue the development of the Soux-Ajax tunnel.

Bingham *Bulletin*: Work has been resumed on the Atlantic tunnel. This tunnel will give drainage to and form a deep outlet for the Atlantic Company's group of mines—the Atlantic, Benjamin, Picket Post, Isabella, Cedar and Robin Red Breast claims—and in its progress is expected to tap ore bodies. It has already been driven nearly 900 feet.

Eureka *Democrat*: The Mammoth mine is still sinking and the 1600 level will be reached in a short time. It is the intention to continue for several hundred feet further. The Mammoth will be the deepest hole in Utah.

IDAHO.

Spokesman-Review: The question of closer concentration of the silver-lead ores of the South Fork is one that has been seriously considered by mine owners ever since the first mill was erected, and it is still as serious as ever. Millions of dollars worth of lead and silver have already gone down the South Fork, and in spite of vast improvements tens of thousands more go every month. Probably no mine in the world has produced as much wealth during the same time as the Tiger-Poorman, Hecla, Black Bear, Helena and Frisco, Standard, Union, Milwaukee and Granite have dumped into Canyon creek along with their tailings. With a view to stop part of this waste an addition 32x100, 14 feet high, is now being made to their mill, which will be filled with tables, vanners and other devices for extracting the ore from the tailings.

At the Pierce camp besides the American Placer Mining Company and several other outfits in Hay gulch, French creek, Rhoades creek, the Bingham Brothers have completed 3960 feet of flume on their property on Reed's creek. They have acquired property reaching for fifteen miles along the creek. Two ditches, one eight miles and the other six miles in length, have been completed, which will furnish a sufficient volume of water to operate the claims.

At Wardner the Bunker Hill and LastChance companies are running a full force. The Stemwinder is working about 60 men, under a lease to J. E. Branscombe. The last named mine has recently been sold by the receiver to the Bunker Hill company.

Following is a synopsis of the manager's report to the De Lamar company of Idaho for the month of November, 1896:

Tons crushed	1,186
Bullion realized	$46,800
Ore shipped	5,800
Other revenue	125
Total	$52,725
Cost and expenses	40,490
Estimated profit	$12,235

MONTANA.

The first annual report of the reorganized Anaconda Copper Mining Company for the year ending June 30, 1896, has been published. The profits of the company for the year were, in round numbers, $4,000,000. The following data is given:

Ore received at reduction works, 1,276,156 tons.

Shipped from Anaconda 107,036,697 pounds of copper.

Shipped from Anaconda 5,308,955 ounces of silver.

Shipped from Anaconda 18,300 ounces of gold.

Total expenditures at the mines, $5,071,677.61.

Total expenditures at Anaconda works, $5,616,516.76.

The company's sawmills cut nearly 12,000,000 feet of lumber per month.

The coal mines produce 60,000 tons of steam and furnace coal per month, and the coke ovens 2700 tons of coke per month.

Concerning these items Mr. Daly says: "The much diminished cost of coal, timber, coke, etc., compared with preceding years, proves the wisdom of the large expenditures for these departments, amounting on June 30, 1896, to $4,755,399.16."

The company pays 35 cents per ton for shipments of ore, coal and coke over the B., A. & P. Railway. The cost heretofore was from 40 to 60 cents per ton. The Anaconda Company owns 51 per cent of the railway. Mr. Daly concludes his report as follows:

"My anticipations for the present year (1896-97) are very favorable. The mines are in good shape for producing ore in large quantities, and at the deepest places in three of the mines—the St. Lawrence at 1200 feet vertical, the Bell at 1300 feet vertical, and the Mountain Consolidated at 1100 feet vertical—bodies of good grade ore are being developed, thus promising well for the future of the mines with increasing depth. The reduction works are in excellent condition and are running with great smoothness. The cost of supplies of coal, etc., will be less than ever before, so, unless something unforseen should happen, I expect that the cost per pound of copper will show a marked reduction as compared with the present statement.

"During the past year something over $1,000,000 of our profits have been absorbed in permanent improvements. For the present year I anticipate such additions will be kept in very moderate limits. At the mines we are erecting two very powerful hoisting engines, with a capacity to hoist from a depth of 3000 feet vertical, but the cost of these engines and other new machinery will be charged to mining, and, although the development work will be most vigorously pushed forward, I do not expect that the extraordinary mining costs will be larger this year than was the case in 1895-96. The timber and coal departments will absorb for 1896-97 say $140,000 new capital, and perhaps some enlargements may be needed for the water supply of the town of Anaconda. Therefore my expectation is that the profits shown in the next annual statement will be nearly all available, either for dividends or for additional working capital."

Butte *Miner*: The Boston & Montana Company has advertised for bids to sink 500 feet in the Atlantic shaft and the West Colusa. The Atlantic shaft will be sunk 200 feet deeper and the West Colusa will be sunk another 300 feet before crosscutting commences.

Inter-Mountain: The Waterloo Copper Mining Company has commenced operations on the McQueeny property, in the Waterloo district. The company is now in 280 feet on the tunnel which they propose to run 1000 feet.

The 10-stamp mill at the Snowy Mountain mine in the Independent district has enough ore in sight to keep it in constant operation for a year.

SOUTH DAKOTA.

Black Hills *Times*: The Union Hill Company have fully decided on the erection of a new 100-stamp mill in Galena camp and also to remodel the old Richmond silver mill and make an 80-stamp mill of it.

John Pierce, of Sioux City, recently secured options on over one hundred claims situated on the free-milling ore belt, adjoining the properties owned and managed by the Homestake Company. The mines bonded to him extend two miles from the mouth of Poorman on Deadwood gulch to Kirk on Whitewood. The strip varies in width from 1500 to 3000 feet and contains millions of tons of pay ore. It is proposed to erect a 400-stamp mill on Belle Fourche or Redwater, to be run by water power, thus reducing the cost of milling to a few cents per ton.

The Keystone M. & M. Co. have decided to double the capacity of their stamp mill and enlarge the cyanide annex for the treatment of the concentrates.

Ragged Top continues to be the center of attraction. Numerous sales and transfers are of daily occurrence, which in the aggregate amount to a considerable sum. All investments so far have been made by local capital.

The report of a rich strike in the Flora shaft on the Dacey and Kilpatrick ground in Ragged Top camp has been confirmed.

The shaft on the Badger group of claims, situated in Ragged Top camp, is now down about 50 feet and has struck an 18-inch vertical vein of ore.

WYOMING.

Tests of the vein of coal recently discovered along the line of the Fremont, Elkhorn & Missouri Pacific Railroad, east of Laramie, show that the coal is nearly equal to the Rock Springs product for domestic use. The vein is six feet thick, and was found in an excellent location for mining and transportation. Several carloads of the coal have already been shipped East.

Lander *Clipper*: A big deal is reported on the Miners Delight property and that of the Diamond Developing Company. The property mentioned in the agreement and deeds in escrow comprise 2040 acres of gold lode and placer claims. The consideration is $200,000, and the agreement is between Edward C. Bartlett, of Omaha, and William R. Parks, of Chicago, with the approval of William Sturgis, of Cheyenne, the legal holder of the title.

COLORADO.

The number of men employed at Silver Plume is 150, Georgetown 300, Empire 140, Lawson 75, Freeland 75, Idaho Springs 1100, Lamartine 100 and Yankee Hill 60, making a total of 2125 miners and mill men.

Denver *Republican*: At Cripple Creek James Tobin of Florence, Wis., has purchased the Burtie, on Carbonate hill, of S. N. Wood, administrator of the estate of W. H. Williams, for $6000.

The Ironclad Company has purchased the lease on its ground held by Murphy, Howell & Sullivan, and will work the property on its own account. Since ore was encountered, about ten months ago, the Ironclad has produced approximately $50,000, on which the company has received close to $10,000 in royalties.

A new corporation known as the Cripple Creek Sampling and Ore Company, of which Charles L. Tutt is president and Spencer Penrose secretary and treasurer, has decided to put in a new sampler in Cripple Creek.

The Maloney cross-vein has been entered in the fifth level of the Anchoria-Leland and found filled with rich ore that assays from $100 to $500 a ton. In the 300 foot working the chute has been followed for 250 feet east, and shows continuously the entire length of stoping almost to the surface.

A shipment of twenty-five tons of $100 ore has been made from the Tomkins and Cone lease on the Hull City placer, adjoining the Vindicator group on the north.

Eastern parties who are working the Tecumseh on Raven hill are now making steady shipments from the ore body which has been under development for several months past. Two levels run south from the shaft 180 feet deep found a wide body of low-grade ore into which comes a small seam of sylvanite rock.

At Twelve Mile Camp in Gilpin county the Morse mine has been sold to a Chicago Company. They have purchased a plant and are going to work this winter.

The Racine mine, in the Ten Mile district, has been sold to a party of men from Rochester, New York, for $35,000.

The report that the Morning Star mine at Ward had closed down is without foundation. On the contrary, it is working steadily and is doing well. Over $6000 was paid out to the employes last Saturday.

An English syndicate has taken hold of the Orphan Boy and Gold Dust group at Copper Rock, and extensive work will be begun.

At Central City Collins Bros., operating the Forfar property, are shipping monthly to the concentrator in Black Hawk from 200 to 250 tons of ore.

The Katie lode, on Bobtail hill, believed to be the extension of the Carr vein, is showing well in the shaft at a depth of 265 feet. The smelting ore streak is 18 inches wide and nets $65 per ton.

The Gunnell mine gives work to from forty to fifty men, and the output of mill ore is sufficent to keep forty stamps dropping night and day at its own mill, treating nearly fifty tons per day.

NEW MEXICO.

Governor W. T. Thornton of New Mexico speaking of the Mexican land grants and mine titles in that Territory says: "Our mining interests are very large, but in that direction New Mexico labors under a very great disadvantage in the fact that so much of our Territory is covered by the old Spanish grants, many of which are now being considered by the Court of Private Land claims. The old Spanish law did not convey the mineral in these grants, reserving it for the crown, and when these grants have been confirmed by Congress the same course has been pursued. But there has been no disposition made of the mineral lands within the grant boundaries, that matter remaining to be settled by Congress at some future time, and, consequently, the lands containing mineral deposits have not as yet been thrown open for settlement. New Mexico is extremely rich in mineral wealth, but there are so many rich deposits included in the grants that the condition of affairs is a great drawback to the development of our mineral resources. A great many of these land grant claims are being disposed of, however, by the Court of Private Land Claims, and, as titles become quieted, our mining enterprises will gradually become more important. Some of the owners of the land grants which have been confirmed by Congress have title to the minerals included within the boundaries of their grants, but in all such cases the right has been conveyed by special act of Congress, which operated as a quit-claim to the mineral on the part of the United States. In all other cases the right to the mineral is vested in the United States."

Silver City *Enterprise*: The first lot of machinery for the new smelter at Copper Flat has arrived. Thirty miners are still at work developing the ore bodies, with good results.

The company recently organized in New York to develop the Turquoise properties have five men employed in the mines, and beautiful gem stones are being produced.

At Mogollon the Confidence mine is employing about sixty men on development work and in the stopes. An ample supply of ore is contracted to keep twenty stamps of the 30 stamp mill at work.

The Golden Giant Company is working about forty-five men at the mine and mill.

La Belle *Cresset*: The La Belle tunnel is now working two shifts and the 500-foot mark will soon be reached.

The Gusdorf brothers are developing the old Shoshone mine on Gold hill. The shaft they are sinking discloses a 3-foot vein of copper pyrites, which carries an average of over $80 per ton.

Sierra County *Advocate*: At Hillsboro Crumrine & Lindner, the leasers at the Snake mine, have 30 inches of sulphide ore, which runs over three ounces per ton.

ARIZONA.

GLOBE DISTRICT.

(Special Correspondence).—At the Continental mine a contract for 500 feet of a crosscut tunnel has begun. It will cut the main vein at a depth of 300 feet from the apex of the vein or 245 feet from the rim of the present shaft. The shaft will also be continued to a depth of 200 feet which will give the shaft a depth of 250 feet and connect with the tunnel at that depth. The Continental vein at the 50-foot level is 55 feet wide; and though the vein is mostly composed of gossan, the copper being mostly leached out, still the whole of the vein will average 5 per cent copper, three dollars in gold and 8 ounces in silver to the ton and the ore grows richer with depth and the vein continues to widen. It is expected that at the 250-foot level the ledge will be much wider than 55 feet. The development of this mine is being watched with great interest by all mining interests of this district for it promises to become a mine of great importance, perhaps similar in value to the Verde mines of Jerome, Arizona, and the Copper Queen mines of Bisbee, Arizona. A British syndicate has the controlling interest in the Continental group and Mr. Edmont de Stoutz, chemist and mining engineer of Geneva, Switzerland, who is a graduate of the mining academy of Frieberg, Saxony, is here looking after the developing of the Continental in the interest of the English syndicate.

The Black Warrior Copper Company have completed their steam hoist and started sinking of the shaft on the Black Warrior copper claim. A contract has also been let by this for the sinking of the Dateville shaft and the ore looks well.

Mr. Kloustermyer, general manager of the Last Hope Silver Mining Company of Cleveland, Ohio, is in Globe for the last month making preparations for the starting of work on the company's property which lies seven miles northeast of Globe City. The mine known as the Cleveland has a great deal of development work on it and bids fair to produce a great amount of silver.

Globe, Dec. 26th, '96.

(Special Correspondence).—In regard to the experiments of the United Verde Copper Company with sulphide smelting without roasting and without carbonaceous fuel in any form, it is a success, and the company expects to have the plant arranged to treat all the ores in that way inside of four months. They have one furnace running now on sulphide smelting without roasting and without fuel, and are making improvements right along which will lessen the cost. They are making arrangements to handle the ores automatically without much labor. The matte from the sulphide smelting is put direct into the converters, and the copper made from it is nearly pure, 99.40 per cent fine, so you see that copper can be made as pure with less process, and also a great saving in copper with less handling.

Jerome, Dec. 28, '96.

Phœnix *Republican*: The United Verde Copper Company which nearly doubled the capacity of its plant during the past summer is still engaged in enlarging its plant and increasing its capacity.

Yuma *Sun*: The placer property of the Monitor Mining Company, known as the Buck Kelly property, at Gila City, has been sold to Sanderson & Co., of Moberly, Missouri, for $25,000. The purchasers will begin work at once.

There are 350 stamps at present in Yavapai county, and 245 in Pinal county.

At Harqua Hala, Messrs. Calloway and Warer are taking out considerable ore in the Bonanza and keeping the 40-stamp mill steadily working.

The Commonwealth Mining Company at Pearce, Cochise county, employs sixty men and ships to the Pueblo smelters three to four carlords of ore per day. The rock is rich in gold and silver, yielding $100 per ton.

C. D. Lane, of San Francisco, is interesting himself in the purchase of some properties in the Dos Cabezas gold district. Should the transfer be made, a mill will be erected and work begun. It is also stated that a 20-stamp mill is to be erected at Pearce within a few months, for the Commonwealth Mining Company. A mill belonging to Manager Brockman which has been in operation at White Signal, N. M., will be torn down and shipped to Pearce. When depth has been attained on the Gold Cliff, which is located near the Commonwealth, the company also intends to put in reduction works.

Nevada City District Geology.

NUMBER IV.

To the north the bedrock rises slowly, but in a northwesterly direction it continues low, and the ground has been opened by the Knickerbocker and Grover tunnels, in which good pay is found in spots. Still deeper is the Phœnix tunnel, on which the last work was done fifteen or twenty years ago. It is about 1200 feet long, in hard granodiorite, and struck gravel in an upraise of 15 or 20 feet near the end. The gravel did not show good pay. From here on northwestward there are no developments until Ragon's claim and the old Empire shaft are reached. The latter is 146 feet deep, and some rich gravel was extracted from it long ago. The channel has here the character of a narrow ravine. Some good pay has also been found higher up on the rim in Ragon's incline. The same channel is again exposed in the hydraulic cut on the north side of the ridge, in the extreme northwestern corner of the district. Some drifting has also been done at this place, and the pay streak is said to have been 50 feet wide. At Stevens and Trevaski a little hydraulic work has been done in the black gravel, and several tunnels have been run in. The principal one is 420 feet in, with the bottom in bedrock at the face. Another is being driven 16 feet lower, and is 200 feet in, entirely in bedrock. At the northeastern side of Cement hill, near Dean's, several long tunnels have been driven, which, at a certain distance in, lose the bedrock and run into black gravel. Dean's new tunnel is 600 feet in, at an elevation of about 2700 feet, and still entirely in bedrock. Black gravel has been struck in a 20-foot upraise. Under the andesite ridge west of Towntalk there is a channel, the bottom of which has not thus far been exposed. It seems to head near Towntalk, where the presence of a small channel was indicated in the railroad tunnel. The tunnel 1000 feet west of Towntalk was made in 1880 and proved too high. Several tunnels have been run in along the rim on the north side of the ridge. Carl's tunnel was run 1000 feet in bedrock and struck only clay and sand in an upraise. Hughes' tunnel is 500 feet in, in bedrock. Schroeder's tunnel is located at the outlet in a small hydraulic cut just outside the map limit, and drifting was going on there on a small scale in 1894. The elevation there is about 2516 feet.

In the Grass Valley district, the Alta channel has been drifted for about 3000 feet from several shafts. The width of the channel was from 50 to 150 feet, but beyond the Hope shaft it appeared to widen, making the extraction less profitable. The total production is estimated to be $1,000,000.

Along the northern edge of the andesite area, east of the Empire mine, smaller hydraulic cuts have been made and 700 feet of the channel drifted. A small channel southeast of Heuston hill was drifted upon for about 400 feet in 1894.

The alluvial gravels are still occasionally worked in the vicinity of Nevada City and Grass Valley, and a gradual process of re-concentration is going on in them. The gravels of Deer creek will probably be worked again at some future time.

Gold Quartz Veins.—The gold quartz veins are fissures in the bedrock series, filled more or less continuously with quartz carrying native gold and auriferous metallic sulphides. These fissures were formed subsequent to the general metamorphism of the range, and also later than the granodiorite intrusions. They are arranged in several systems, the fissures in each system being approximately parallel. The force producing them had frequently the effect of dividing the country rock into a great number of parallel sheets, from a few inches to several feet thick. Along a few of these fissures considerable faulting took place, but where the rock was extensively divided into sheets the movement on each was probably small. Open spaces varying in width from a fraction of an inch to several feet resulted along the fissures. Solutions of thermal water, charged with carbonates, silica, gold and other metals, entered these fissures, probably ascending from below, and deposited their contents in them, usually also penetrating the adjoining porous and often shattered rock for a distance varying from a few inches to several feet. The effect produced on the country rock was to convert it into a gray or light-colored rock, of greasy feel, consisting of carbonates, white mica and pyrite. The gold is almost invariably concentrated in the quartz which fills the open fissure. The adjoining altered country rock, sometimes referred to as "cab" or "gouge," very seldom contains a paying amount of gold. Shattered zones, or seam mines, in which the country rock is traversed by swarms of minute, often rich, quartz seams, do not occur to any large extent in this district. The pay is chiefly confined to the quartz within the well-defined limits of the walls of the fissure. The ideal vein is a plate of quartz contained between two well-defined separating planes, the foot and the hanging wall. Such veins occur, but the ideal regularity is usually not preserved for any long distance. The quartz may pinch out entirely, leaving as guide only a narrow seam; the space between the walls may contain several smaller veins separated by masses of country rock, or "horses." While in certain mines all quartz may be pay ore, it is usual to find rich and barren quartz alternating. The rich quartz forms irregular, or, more frequently, long-drawn masses, usually with a steep dip on the plane of the vein; these are called ore chutes, or shoots. The width of the pay quartz varies from several feet to a fraction of a foot; the narrower the vein the richer the contents must be to pay. The general tenor of the pay ore of the district varies between $5 and $50, though smaller masses of higher grade are met with. The sulphurets make up from a fraction of 1 per cent to 10 per cent of the quartz mined, and contain from $30 to $100 or $200 per ton.

The veins of the district may be divided into four classes, according to their direction and dip: 1. The Orleans-Idaho system; strike, west-northwest to east-southeast; steep southerly dip. 2. The Willow Valley system; strike, about east to west; dip, medium to flat, northerly or southerly. 3. The Omaha-Empire system; strike, north to south; dip, medium to flat, westerly. 4. The Providence system; strike, north to south; dip, medium, easterly.

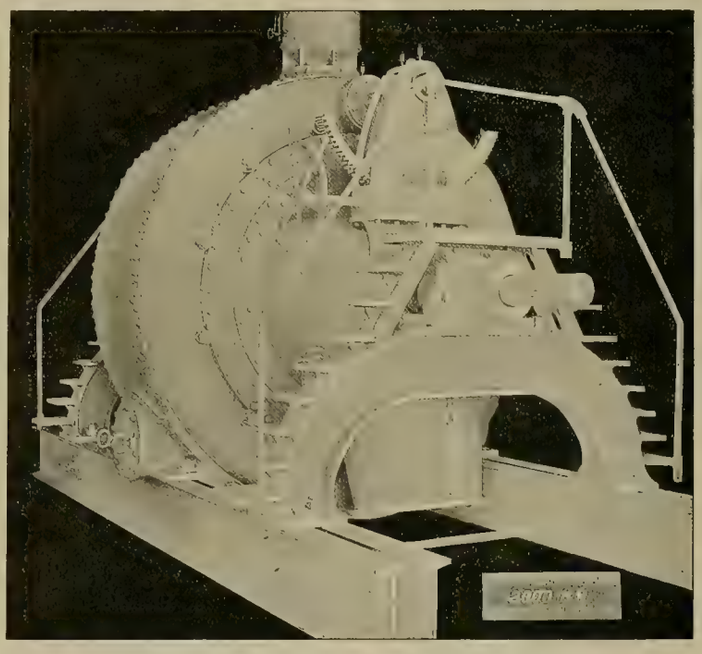
(To be Continued.)

Scientific Progress.

Unique Magnetic Experiment.

Some time ago Folgheraiter began testing old Pompeiian and Tuscan vases with the view to determining their polarity, his theory being that they would retain the same direction of magnetization as when baked, and that this would correspond with the magnetic dip at that time. He has now completed, for the present, this investigation. Speaking of this the London *Electrician* says:

A unique interest attaches to this work. It will be remembered that he was trying to discover the magnetic dip, say, at the time of Romulus, by the present magnetization of Tuscan vases. He proved that the clay they are made of is magnetized in the direction of the earth's magnetic force during firing, and retains that magnetism indefinitely after cooling. Some of these vases, notably the wine jugs, *oinochoai*, could only stand upright in the furnace, and might, therefore, serve as self-registering indicators of the magnetic dip. Now, the most curious fact brought to light is that the north-seeking pole of these vases has a variety of dips from 25° above to 25° below the horizon, but never more than that. Hence, our author argues, the dip cannot have been anything like its present value (60° at Florence) at the time of the Roman kings. He is inclined to think that the N.-seeking pole pointed a few degrees above the horizon in the Eighth century B. C., and that the needle was (or would have been, had it existed), horizontal a few centuries afterwards."



At the annual meeting of the American Society of Mechanical Engineers the president, John Fritz, who spoke on the "Progress in the Manufacture of Iron and Steel in America," said that at Bethlehem they now have lathes which have taken work weighing over 190,000 pounds, and they have planers that have finished castings each weighing 165 tons. Shafts 18 or 20 inches in diameter and 60 to 70 feet or more in length, lying in Vs, can be turned easily by one man with a lever 36 inches long, showing the high character of the work. Fritz next took up the matter of forging. He gave the results of some physical tests to show progress that has been made in recent years. A test of puddled bar reworked car axle gave tensile strength of 44,000 to 45,000 pounds; elastic limit, 18,000 to 23,000 pounds; elongation, 21 to 27 per cent; contraction of area, 40 to 48 per cent. He compared with this results from hollow-forged, oil-hardened and annealed nickel steel shafting, which give: Tensile strength, 95,000 to 100,000 pounds; elastic limit, 60,000 to 65,000 pounds; elongation, 20 to 25 per cent; contraction of area, 55 to 60 per cent. In shafts of any size a nickel steel shaft as above would have three times the elastic strength of a wrought iron shaft, and it would be possible to make a nickel steel shaft of one-quarter the weight of a wrought iron shaft and obtain the same elastic working strength. The modern practice of steel making has, in the hands of the mechanical engineer, the metallurgist and the chemist, wrought wonders in producing material which in quantity, physical qualities and cheapness would have been regarded as utterly impossible half a century ago. To-day we are enabled to use steel for the commonest purposes as well as for the most expensive article produced by the skill of the mechanic. No article is too simple to be made of it and no structure so grand and important as to refuse its service.

As to the age of the Niagara Falls, geologists differ widely in opinion. At first it was estimated that the Niagara river came into existence, through changes in the level of the land around the Great Lakes, about 55,000 years ago. Later this was reduced to only 12,000 years. Sir Charles Lyell increased the estimate again to 35,000 years; but more recently others have lowered it to about 9000 years. The latest estimate is that of Dr. J. W. Spencer, who, basing his conclusions on the most recent investigations, places the age of the river at 32,000 years, and that of the cataract at 31,000 years. At one period, many thousand years ago, the height of the falls was 420 feet.

Electrical Progress.

Niagara Type of Turbine.

In the new electric power plant built by the Niagara Falls Hydraulic Power & Manufacturing Company at Niagara for the purpose of supplying the new aluminum factory of the Pittsburg Reduction Company with power are four wheels made by James Leffel & Company, of Springfield, Ohio, which stand on the floor, and receive their supply of water through 5-foot inlet pipes connected with the penstock. Each wheel has its individual inlet pipe and water supply, and can be operated alone. In the inlet pipes there are 60-inch valves operated by hydraulic pressure. Each wheel weighs about fifty tons; they are supported on double steel beams resting on solid stone foundations. James Leffel & Co. call this wheel their Niagara type. It is illustrated on this page. The *Electrical Engineer* describes it as a double discharge turbine and consists of a large, flattened, vertical, circular casing containing the guide case of the wheel proper. Through the supply pipes below the water is let into this exterior casing, flowing upwards and surrounding the guide case. A series of oscillating guides, which constitute the gates, admit the water to the runner. The discharge pipes project from the sides of this casing, laterally and down by a gradual curve, to draft tubes 20 feet in length, thus utilizing a portion of the atmospheric pressure. The heads of the large casing are made of 3½-inch cast iron and are of curved form and shape. The straight or cylindrical part of the case is made of steel plates ¾ of an inch thick, double riveted to the cast heads. Within this casing and the guide casing the runner or wheel proper is located on a horizontal shaft, which is supported by adjustable ball and socket oil bearings on heavy arched bridge trees exterior to the outer casing. The runner is made of bronze and iron, and is 74 inches in diameter. The buckets are made of bronze, and receive the water by a sharp dividing ridge, the central portion, upon which the shell is fastened, being of iron. The water is discharged from

LEFFEL NIAGARA TURBINE, 2000 H. P.

the wheels laterally into the discharge pipes, and owing to the design of the wheels there is no uncompensated pressure on any part of the wheel, and no end thrust or pressure on the shaft, the whole being in perfect balance wherever it touches water. The head under which these wheels operate is about 210 feet. One of these wheels is driving two electric railways, the Lewiston & Youngstown road, and the Niagara Falls & Lewistown Railway.

WITHIN a few weeks the twelve turn bridges in Chicago betweed Twelfth street and the lake will be changed from steam to electric power. It is claimed the change will save the city $1,000 per month.

Mechanical Progress.

Efficiency of the Boiler Grate.

At the December meeting of the American Society of Mechanical Engineers, William Wallace Christie read a paper on the "Efficiency of the Boiler Grate" in which he made the following conclusions:

I collected the data from 108 boiler tests, paying particular attention to the pounds of coal burned per square foot of grate at which the greatest quantity of water is evaporated.

These tests were all that I could obtain from various sources, and as far as can be ascertained are reasonably authentic.

In fact, the averages probably represent present practice fairly, and are, from both economy and capacity, tests made by the author and others.

From the tables we have the following averages:

Pounds of coal per H. P. developed per hour	3.64
Pounds of combustible H. P. developed per hour	3.04
Pounds of coal burned per square foot of grate per hour	18.16

Professor Rankine says: "The rate of combustion in factory boilers is 12 to 16 pounds of coal to the square foot of grate."

Dr. Thurston says in boiler trials: "In land boilers it is customary to keep the rate of combustion per square foot of grate down to about eight pounds per hour, although it frequently rises to 10 or 12 pounds."

The experiments show that 13 pounds of coal burned per square foot of grate per hour of either anthracite or bituminous coal gives the greatest economy in evaporation.

The greatest amount of anthracite coal found to have been burned per square foot of grate was 33.70 pounds; the least, 4.70 pounds.

The greatest amount of bituminous coal found to have been burned per square foot of grate per hour was 57 pounds; the least, 6.70 pounds.

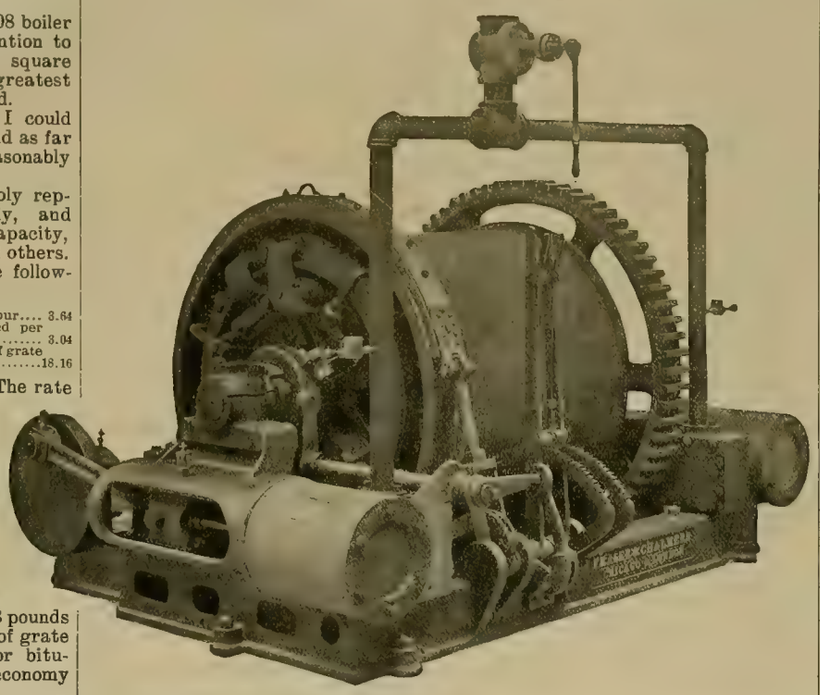
Land stationary boilers are the only ones considered in the paper.

The pounds of combustible per H. P. per hour was noted especially because of its giving a fairer way of comparing the economy of different boilers, and is, I believe, in accordance with the views of Dr. Emery.

It will be seen that less than 4 pounds of coal in the most of cases is that which is required to be burned per square foot of grate per hour to produce one H. P., and as 13 pounds of coal burned per square foot of grate is a most economical rate of rate of combustion, 13 divided by 4 or 3.25 H. P. per square foot of grate per hour is economically attainable.

The above is for anthracite coal. For bituminous coal, as 23 8 pounds burned per square foot of grate is an economical rate of combustion, 23 8 divided by 4 or 5.95 H. P. per square foot of grate per hour is economically attainable.

The average of 13 and 23.8 is 18.4, which is very near 18.16, the average of all the 108 tests.



It certainly is understood that the above figures may have need of variance for special coals or conditions, and are only intended to give averages.

The 23.8 is obtained by multiplying 13×1.83 a coefficient subsequently deducted), and 1.83 agrees with Mr. Harris' rule for grate area for bituminous coal burned with natural draft and this is a very economical rate of combustion (23.8) for bituminous coal.

Portable Hoisting Engine.

The cut on this page shows a standard portable hoisting engine for hoisting from small mines, or for underground hoisting or haulage, where the output of the mines does not warrant the use of a direct acting engine. The cut shows a single drum hoist, but they are built with two drums and in exactly the same style. The engine frames, cylinders and engine shaft bearings are cast in one piece on the smaller sizes, and, as the guides and cylinder are bored at the same time, there is no chance of getting out of line.

STANDARD SINGLE DRUM PORTABLE HOISTING MACHINE.

On the larger sizes the cylinder is cast separate, to facilitate molding, but it is bored in line with the guides, to which it is bolted with studs and nuts. The two engines are held together by connecting pieces of bedplate, which have finished tongues on the ends, fitting into finished grooves in the engine frames and to which they are firmly bolted. This makes practically a solid piece of the two engines and connecting pieces of bedplate, and makes a machine that the roughest of usage will not throw out of alignment. On account of this construction, no special foundation is considered necessary.

These machines have lately been put on the market by Fraser & Chalmers, Chicago, Ill.

THE longest distance at which the long distance telephone is now practically operated is from Boston to St. Louis, a distance of 1400 miles. This is twice as long as any European line.

Practical Information.

New Sources of Error in Mine Surveys.

Electricity is being used so much in mining operations that it is very important that every mining engineer and surveyor should be made acquainted with the result of some very recent experiments on the effect of electric currents on delicate instruments. In the Westphalian coal fields electric railways are rapidly on the increase, and the question arose whether the electric currents exercised any detrimental action upon the magnetic mine surveying instruments which are used so largely in the German mines.

In order to determine this, Prof. Lenz selected a point underground at a horizontal distance of about 100 yards from the rails of an electric railway, and 1420 feet below it. Then by means of a magnetometer, with quartz fiber suspension, a series of observations of variation were made, based on a fixed line. The day curve was very irregular, while the night results displayed perfect regularity, and were in accord with the magnetic records.

This exhibited that magnetic observations can, under such conditions, be only satisfactorily conducted during the night, in the absence of the magnetic current. Another source of error is the safety lamp. Composed of various metals, the lamp in a hot condition sets up thermo-electric currents which act on the magnetic needle.

In order to obtain information on this point six mine surveyor's safety lamps, free from iron, were placed one at a time, first in a cold condition and then heated, at a pole of a sensitive magnetometer. Of the six lamps, two, when cold, had no action on the needle, while all acted on it when hot. The deviations observed amounted to from 30 seconds to 100 seconds.

A new benzine lamp, that had not been previously used, caused a deviation of as much as 5 minutes. The deviation increased with the temperature of the lamp. A new aluminum safety lamp caused the same deviation when cold as when hot. From these results it follows that the mine surveyor, before making magnetic observations with delicate instruments, should carefully test his lamp. The influence of slight magnetic properties may be lessened by holding the light in the prolongation of the magnetic axis. With side lighting great care is necessary. It is thus demonstrated that the mining engineer and surveyor should make their observations at night. If they carry out that operation during the daytime in the neighborhood of an electric plant, etc., the results are almost certain to be wrong, and trouble will ensue.—W. A. Engard in the Colliery Engineer.

Things That Are Near.

Flying is solved. The principle is known. A mechanical expedient is all that is now needed to make it successful. Practical flight is to-day not more than five or ten years off.

A glow worm makes light with about one three hundredth part of the force used in ordinary artificial light. When men know how to make light as cheap, streets and homes will be as light as day for a mere fraction of what light now costs. This is near. Vacuum illumination without incandescence is already in full operation, and in a year or two should cut down the price of light to a sixth of its current cost, and in five or ten years light may be, like water, turned on in every house at will.

Compressed air has long been known to be the best way, theoretically, to store force for use in transportation. There is no waste and no deterioration. The need is a cheap and efficient motor to apply compressed air to city transportation.

DURING 1896 only 1802 miles of railway were built in the United States, the smallest mileage in any year since 1875. The number of lines on which this track was laid is 163—11 less than the number of new lines added in the previous year. Track was laid in thirty-eight of the States and Territories. California had 167 miles on eight lines, Louisiana 154 miles on five lines, Michigan 146 miles on eleven lines, Georgia 97 miles on fourteen lines, Pennsylvania 90 miles on fifteen lines, Wisconsin 86 miles on seven lines, and Texas 83 miles on eight lines. Many railway enterprises were under way early in the year which would have added hundreds of miles of track, but were stopped by the financial agitation preceding the election. The building of fully 2500 miles would have been the record of 1896 but for the political uncertainty.

OF the three great ship canals built within a comparatively recent period, the Baltic, with its sixty-one miles of canal, depth of nearly 30 feet and width of 89 feet, consumed eight years in construction and cost nearly $38,000,000; the Manchester canal, with its fifteen and one-half miles of channel, 26 feet depth and 120 feet width, took six years to build, and cost in the neighborhood of $77,000,000; and now the estimates of the Chicago canal are twenty-eight miles of channel, a depth of 35 feet and width of from 160 to 210 feet, costing less than $29,000,000.

TO RESTORE burned steel tools to their former usefulness they should be heated to a bright red and then allowed to cool off in a mixture composed as follows: Melt 500 parts of tallow and 120 parts of black pitch together and add gradually, under continuous stirring, 375 parts of pulverized sal ammoniac, 125 parts of ferrocyanide of potash, 20 parts of soft soap and a handful of common salt. In the case of larger tools heating and dipping should be repeated.

ACCORDING to the report of the Bureau of Statistics of the United States, the exports of gold and silver for October, 1895 and 1896, and for ten months ending October 30th, 1895 and 1896, were as follows:

	October		Ten Months Ending October	
	1895.	1896.	1895.	1896.
Gold—				
Imports	$1,797,040	$27,961,083	$30,636,979	$92,849,939
Exports	1,873,897	343,168	75,064,179	55,913,589
Silver—				
Imports	1,391,831	993,440	9,372,495	9,448,077
Exports	4,594,447	4,794,339	43,259,057	51,235,380

A MATHEMATICIAN has computed the movements of a rider's feet while working a bicycle, and has demonstrated that it requires less exertion to travel fifteen miles on a bicycle than to walk three miles.

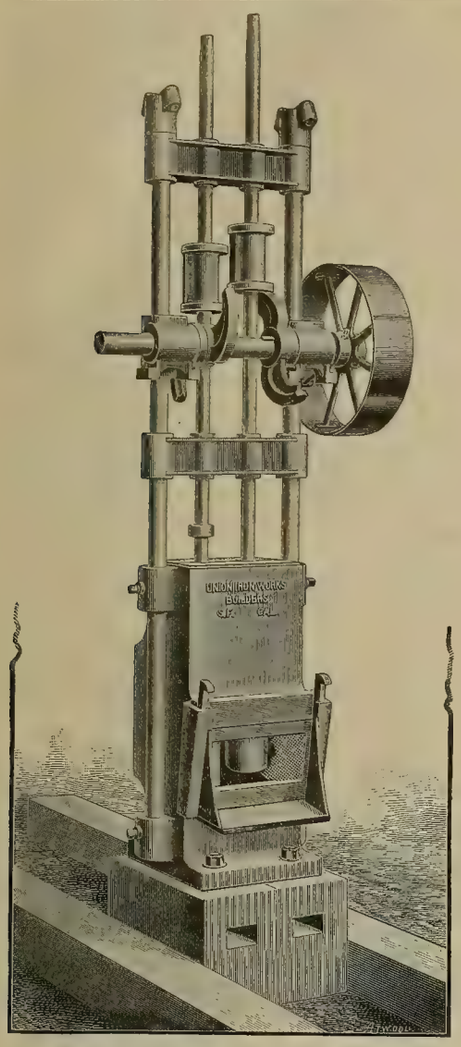
THE PACIFIC AMALGAMATOR



MILL OR PLACER.
A Guarantee With Each Machine.
This machine is the finest gold saver for both placer mines and quartz mills. No other plate necessary in mills where the Pacific Amalgamator is used. It is constructed almost entirely of metal; it can be transported on pack train. Possesses a large amount of silvered amalgamating plate surface. No scouring of amalgam. Any ordinary amalgamator can operate the machine with good success. Send for catalogue.

PROSPECTING BATTERY.

UNION IRON WORKS,

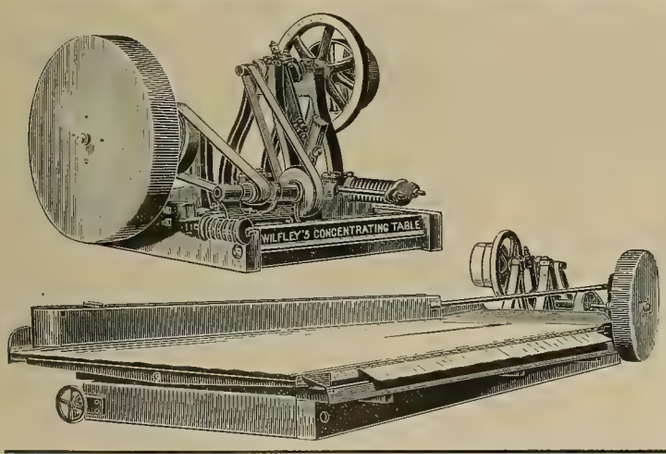
222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS



Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

The Mine and Smelter Supply Co.,

. . . DENVER, COLORADO, . . .

ARE SOLE AGENTS FOR THE

WILFLEY TABLE,

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Any one can learn to operate in an hour. . . . . .

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; M. E. Smith Concentrator, Golden, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; W. H. Bellows, Boyd Mill, Boulder, Col.; H. E. Woods, Denver, Col.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For Saving Gold

IN QUARTZ, GRAVEL OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates replated, bought, or gold separated. THOUSANDS OF ORDERS FILLED.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco, Cal.

PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st. prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

Coast Industrial Notes.

—The Selma, Cal., flouring mill was destroyed by fire last week. The loss was $42,000.

—The Southern Pacific Company will pay a dividend of one-half per cent on the stock of the Central Pacific Railroad.

—Victoria, B. C., aldermen have voted to issue $125,000 in bonds for a new steel bridge with three spans of 217 feet each.

—Claus Spreckels has 250 people employed at his Watsonville, Cal., beet-sugar factory at wages varying from $2.50 to $4 per day.

—The Central Pacific Railroad earned net for October $613,468, an increase of $51,680; from January 1st to October 31st, $4,003,287; increase $21,644.

—The San Francisco and North Pacific road earned net for November $20,000, an increase of $3,592, and from July 1st to November 30th $142,630, decrease $11,827.

—The Southern Pacific Company earned gross for October $5,179,912, a decrease of $168,303, and net $2,321,970, decrease $58,205. The gross earnings from January 1st to October 31st were $31,378,604, a decrease of $1,504,357; net $13,354,424, decrease $179,054.

—The Sunset Oil Company has incorporated in Fresno, Cal., "to develop petroleum, sulphur, gypsum and other mineral lands." G. L. Warlow, J. B. Rader, M. McWhorter, G. W. Smith, C. J. Miner, W. D. Creighton, Fresno. Capital stock, $100,000; subscribed, $15,700.

—The Santa Fe Railway management is considering a plan of substituting gasoline power for steam power in the operation of the 1000 water tanks on its system. It is said that the change will enable the company to make a saving of $50,000 a year. An experiment will be made this month, and if it proves successful, the change will be made.

—The Great Northern Railroad is reported to have a surveying party running a line for the construction of a branch road into the British Columbia mining region next summer. The company, it is said, has two routes under consideration, one a rail line between Bonner's Ferry north along the Kootenay river to Kaslo, terminus of the Kasio & Slocan, another to build across Trail Creek country to a point near the Spokane & Northern, on the line between Spokane and Nelson.

—H. C. Henry of Seattle, Wash., has the contract to build the approaches to the Great Northern Railroad's tunnel through the Cascade mountains in western Washington, and men are on their way to commence preliminary work. It will take about six months to do the work, and then everything will be ready to commence on the track, which will be one of the greatest engineering feats in Pacific coast railroading. The tunnel will be two and a half miles long, and will reduce the altitude of that part of the road 1000 feet.

—The officials of the Denver & Rio Grande Railway are considering the possibilities of the California & Nevada Railway, and it is possible that the narrow-gauge line may pass into their control. At the request of Charles Smith of Denver, who has the first mortgage bonds of the line, Receiver King has prepared an extended report on the road, and copies of the document have been sent to Denver. The report points out that the little 22-mile line offers one of the few openings still left by which San Francisco may be reached from the Alameda side of the bay. The creek and the land in the vicinity of West Oakland are covered with a network of tracks, and any more franchises seem to be precluded.

—Last week electricity was brought into Sacramento over the new line of the Central Electric Company from its power house at Newcastle, Placer county, thirty miles distant, the power being furnished from the reservoirs of the South Yuba Water Company. Three high potential wires carry the current to the station in Sacramento, which is furnished with two motors and two arc light dynamos, which will run 120 arc lights. It has also eight step-down transformers to reduce the voltage, and the switchboard is furnished with several of the latest improvements. Last week a current of 15,000 volts was turned on at Newcastle to test the line, and it was found to be in perfect order clear to that city.

—The following regarding importations at frontier ports of Mexico is of interest to shippers: Packages of merchandise must contain only one mark and number, to facilitate identification. Difference exists between net weight and legal weight. Net weight represents the intrinsic weight of the merchandise itself, while legal weight includes all kinds of interior packing. The customs tariff states plainly when duties are to be charged on net weight, and on legal weight. The metric system went into effect in Mexico September 1st. As a misapprehension seems to exist among American shippers as to the classification of machinery, it is to be noted that all articles, even when imported with machinery, and forming part therof, but which can be put to another use than that for which they were designedly imported, must pay the duty as set forth in the tariff. Extreme care should be taken to give the exact number of the packages shipped. Any excess over the number specified in the manifest will incur heavy penalties, which are always rigidly enforced. When shipping goods in bond, see that the proper entry be made at the custom house or port of shipment, so as to allow of the importation into Mexico without making new entry at the United States custom house at the frontier.

Recent California Mining Incorporations.

War Eagle M. and M. Co., S. F.: B. W. Haines, R. Barnett, W. R. Hall, W. J. Palmer, J. H. Lewis; capital stock $100,000; $40,000 subscribed.

Commercial Paragraphs.

THE Truax Manufacturing Company of Denver, Colo., has just filled an order from Mexico for 6 No. 21 B ore cars and 48 sets of wheels and axles.

HENDRIE & BOLTOFF of Denver, Col., have a contract for supplying the 24-inch iron pipe for the North Denver public sewer, at their bid of $32 per ton, delivered on the ground.

THE Hercules Gas Engine Works have completed a 25 H. P. milling engine for the Randsburg district, to be used in a new 10-stamp mill now being erected. The engine is designed to specially withstand the severe conditions existing in the desert country.

THE contract for the new plant of 120 stamps, with both steam and electrical power for the Diamond Hill gold mines in Montana, has been awarded to the Union Iron Works of San Francisco. The electrical plant will be built complete from the foundation by the General Electric Company of New York. The electrical power will be manufactured at Crow river, 14,000 feet from the mill, and be transmitted that distance over seven wires. A large Rand air compressor with capacity of ten drills will be used, driven by electricity. The power will be delivered at the mill over eight motors, so that one-half the plant can be closed down while the other half is running. The main building will be nearly 300 feet in length. The rock breaker at the mouth of the main tunnel has a capacity of 60 tons per hour. The stamps will be 1000 pounds each. This mine will have a capacity of 500 tons daily. A cyanide plant for reducing the concentrates, with capacity of 30 tons daily, will be connected.

A SYNDICATE in which the officers of the American Cyanide Gold and Silver Recovery Company of Denver, are interested, purchased last summer the Young America mines and mills in Sierra county, California, and built a 100-ton mill to work the ores of that property. They have been operating the mill the past few months successfully and turning out gold bullion. The di-oxide-cyanide process, controlled by the American Cyanide Gold and Silver Recovery Company, has made an extraction at this mill of over 95 per cent of the values of the tailings. Captain J. R. DeLamar is operating this process at the DeLamar mines in Nevada, at a mill having a capacity of 220 tons per day. Captain DeLamar has closed a contract with the American Cyanide Gold and Silver Recovery Company for right to operate this process in a new mill which he is about to erect at the Golden Gate mines, in Mercur district, Utah, which, it is claimed, will be the largest cyanide mill in this country—400 tons per day. Another mill using this process is being operated in Kittitas county, Washington. The ores of the latter region are treated to a very high extraction by this process. The Wiswall-Frank Precipitation process is being used in connection with the di-oxide-cyanide process at all the mills above named.

Personal.

F. H. MILLS of Calumet, Mich., is the new manager of the Merced G. M. Co. at Coulterville, Cal.

CHARLES BUTTERS is in Cripple Creek, Colorado, and expects to reach San Francisco about the middle of January.

THE Nevada, Cal., *Transcript* of Dec. 24, in a long article, pays a just tribute to the zeal and efficiency of Fred Zietler, superintendent Champion mine.

D. H. JACKSON, superintendent of the Larkin mine, who has been in poor health for some time past, has resigned his position and returned to his home in Oakland to recuperate.

RUSSELL L. DUNN, who left San Francisco in August for Siberia to examine and report upon some gravel properties for a Parisian syndicate, was at last mail dates at Gorbitza, on the Chilka river, a branch of the Amoor, in Siberia.

Recently Declared Mining Dividends.

Pennsylvania Mining Co., Grass Valley, Cal., $2,675; payable December 28.

Homestake, South Dakota, $31,250, payable Dec. 26th, a total to date of $6,087,500.

Morning Star Gravel Mining Co., Iowa Hill, Placer county, Cal., Dec. 28th, dividend No. 73, $6 per share, payable immediately.

COLORADO'S GOLD FIELDS.

Millions Upon Millions of Dollars in Gold Have Been Added to the World's Wealth.

It is a well-known fact that the richest and most famous gold mines in the known world are those of Colorado, many of which are paying to fortunate investors millions of dollars annually in dividends. Some shrewd persons who invested only a few dollars are now receiving hundreds and thousands in profits, and, judging from present indications, there are more desirable chances to invest just now than ever before. New mines are discovered daily and old ones strike richer veins of gold.

In order to meet the great demand for reliable information about mines and mining camps, one of Denver's oldest and best known publishers has just issued a handsomely illustrated book accurately describing every mining camp in the entire State of Colorado, giving scores of truthful photo-engravings of famous mines, mountains, cities, etc. Cripple Creek, the world's wonder, is fully described; also a correct map of the district. Narratives of how many poor people have become wealthy by judicious investments in gold mines, and sketches of former prospectors who are now fixed for life. Tells how to avoid unscrupulous brokers and sharpers. The volume has been carefully compiled by a disinterested author and every statement made is guaranteed to be true. All terms and phrases of miners fully explained; tables showing the State's production of gold and silver for 35 years past. The publisher will send by return mail a copy of the above great book upon receipt of $1 (currency or stamps), which also includes a full-paid yearly subscription to his big 56-column weekly family paper, the *Illustrated Sentinel* of Denver, Colorado (established 1890). Clubs of 6 and six books, $5. The paper contains each week all the latest mining news and illustrations of Rocky mountain scenery, also true stories of love and adventure.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

Do You Know

THAT THE . . . .

MINING AND SCIENTIFIC PRESS

HAS THE . . . .

★ Largest Circulation of any Paper of the kind in the Country? : : : : : : :

THAT IT IS . . . .

THE ONLY PAPER

. . . . OF ITS CLASS

✦✦✦✦ THAT GIVES THE EXACT FIGURES OF ITS CIRCULATION? : : : : :

It Is Weekly Read by More Than 20,000 Men in Every Department of Mining and Mechanical Industry.

IF you want your business advertisement seen by the *MEN TO WHOM YOU NATURALLY LOOK FOR BUSINESS*, put it in the

MINING AND SCIENTIFIC PRESS.

Established May, 1860.

A paper that has led in its line for thirty-six years must have the qualifications that entitle it to the patronage of intelligent men who realize that, while advertising pays, money is thrown away that is given for advertising in papers with no circulation and which gives no results.

It is not what advertising costs, but what it produces, that determines its value.

The MINING AND SCIENTIFIC PRESS produces satisfactory results to those who use it. : : : : : :

Economy is the judicious expenditure of money. It is sometimes economy to save ten cents; it is sometimes economy to spend a thousand dollars. Economy in advertising means to put your advertisement where it will do you good.

Success or failure depends upon profitable advertising. Our patrons find an investment in our columns a profitable one.

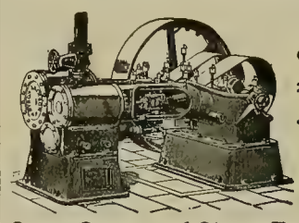
MINING AND MILLING MACHINERY.

HENDY-NORBOM CONCENTRATOR.



Office of G. McM. Ross, Superintendent Webb Gold Mining Company,
Brown's Valley, Cal., September 14, 1896.

Mr. John O. Norbom—Dear Sir: I have been using your Concentrators at our mines in Brown's Valley and am pleased to inform you that they are in every respect thoroughly satisfactory. When erecting the plant at the above-named place we built Canvas plant, but since putting in your Concentrators we have but little use for that. The percentage of sulphurets now being handled is from 1½ to 2 per cent, mostly galena and iron pyrites, and crushed fine. We save from the pulp over your machine 98½ per cent, and it hardly pays for the labor on the Canvas plant. The motion given your Vanner by its delicately constructed curved springs renders it a perfect machine, and in my estimation it is but a short time before it will replace all other machines of a like nature now in use.

Yours very respectfully, F. W. Page, General Manager.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

A Great Mining Triumph.

Capt. J. R. DeLamar, of New York City, is one of the largest owners and workers of Gold Mines in the world. After the most careful investigation he purchased in August, 1895, two Griffin Mills, and his report is so remarkable as to demand the careful attention of every one interested in Gold Mining.

We give it in his own words.

NEW YORK, Jan. 1, 1896.

BRADLEY PULVERIZER CO. *Gentlemen:*—The two Griffin Mills have been in operation now for 90 days on the hardest rock, with the exception of corundum, that I have ever met during my mining life. They have taken the rock direct from the breaker and they average about 20 tons to each machine, per mesh line, without elevating or bolting. We simply put a ¼ mesh screen around the Griffin Mill, and the stuff comes out 40 mesh fine or over, which makes it an excellent pulp for leaching by cyanide or chlorination, therefore we have concluded to order **10 more Griffin Mills**. We have tried high-speed rolls and dry stamps, and after looking into the Huntington Dry Pulverizer, the Natod Pulverizer, the Stedman Pulverizer, the Frisbee Disc, the Cook, and various other dry pulverizers, unhesitatingly recommend your Griffin Mill to any one.

Yours truly, (Signed) J. R. DeLAMAR.

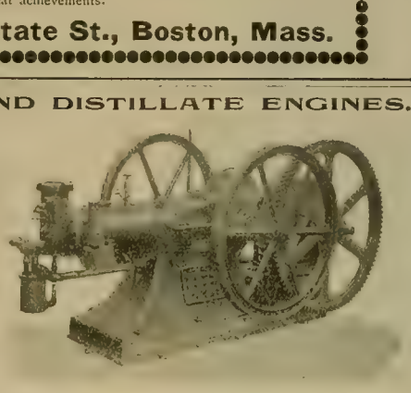
HOW 10 GRIFFIN MILLS WORK.

DeLAMAR'S NEVADA GOLD MINING CO.,
SALT LAKE CITY, UTAH, Nov. 24, 1896.

BRADLEY PULVERIZER CO. *Gentlemen:*—In answer to your inquiry as to what the "Griffin Mill" is doing at our DeLamar Mill, DeLamar, Nevada, we beg to state that we often run 220 tons per day with 10 of your mills in operation, and on one occasion these 10 mills produced 308 tons in one day. I have no hesitancy in stating that they will regularly produce at least 30 tons per day each on our ore, which is extremely and unusually hard.

Yours very truly, H. A. COHEN, *General Manager.*

These strong letters coming from such representative men are conclusive evidence that we are right in claiming that the "Griffin Mill" will produce a larger amount of finer pulp at less cost than any other stamp or pulverizer made.



Let us send you a free copy of our illustrated pamphlet, which will tell you all about the Mill and bring to you other evidence of its great achievements.

BRADLEY PULVERIZER CO., 92 State St., Boston, Mass.

Tintic Mining District, UTAH.

The Tintic Mining District lies eighty-five miles south of Salt Lake City on the Rio Grande Western Railway, and is, as shown by the records of 1895 and so far in the present year, the greatest mineral producing district in Utah.

The names of the great bonanzas of Tintic, the Mammoth, Centennial-Eureka, Bullion-Beck, Eureka Hill and Gemini are recognized everywhere that the mining industry is known. The four former have each a record exceeding $1,000,000 in dividends and the latter of over $600,000.

Until within the last two or three years no adequate means of reduction of Tintic ores was in operation in the district and the production of the mines was limited to those ores sufficiently rich to be shipped to the smelters for treatment, but this has been changed by the erection of immense combination and concentration milling plants which can work at a profit those immense deposits of low grade ores which fill all the producing mines of the district. Four of these mills are in active operation, and three others will undoubtedly be erected within the next year.

The ores of Tintic are greatly diversified in character. The principal metals produced are gold, silver, copper and lead. In silver production Tintic leads the State, while in the production of gold it stands second on the list. Beside the big bonanzas above mentioned there are some twenty-five or more properties that now and in the past have been producing mines, and to these may be added a score of others which have paid for their development by their products, and upon which the recent revival of the mining industry has had the effect of a recommencement of operations.

Tintic has four thriving towns—Eureka, the business center of the district, with a population of 2,500; Mammoth, population 1,000; Robinson and Silver City, 500 each, all of which offer great inducements for investments in a business way.

At the base of the foot hills only a few miles away, is a valley of 25,000 acres of choice fruit and garden lands, watered by the Mt. Nebo Land and Irrigation Company.

As to the future of Tintic, it is no exaggeration to say that it possesses the brightest prospects of any mining district in Utah, and offers to the prospective inventor opportunities which cannot be excelled.

The Rio Grande Western Railway has a double daily train service between Salt Lake City and the Tintic Mining District. For further particulars apply to F. A. WADLEIGH, General Passenger Agent, Salt Lake City.

A Standard Work.

THIRD EDITION JUST OUT.

Assaying Gold

.....AND.....

Silver Ores.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 220 Market St., San Francisco.

Miners, Attention!

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
220 Market Street..... San Francisco, Cal

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous Illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.
By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.
By Sylvanus P. Thompson..... 80 cts.

Practical Treatise on Hyaraulic Mining.
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.
By T. E. Van Wagenan.....$1 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$5 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventdenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Assayer's Guide.
By Oscar M. Lieber.....$1 50

Assayer's Manual.
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

Metallurgy of Silver, Gold and Mercury in the United States.
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 31, 1896.

Mid-winter holidays, stock taking and general rain storms have had their influences on business, but the groundwork is being laid for pushing business for the spring trade. That the outlook is of the most flattering character is conceded on all hands. The agricultural industry promises a larger outturn of farm, dairy and orchard products than has been the case for several years past. This is made possible by more outdoor work having been done and bountiful precipitations at the right time. The ground is soaked to a greater depth than for all of five years, which gives assurance of a water supply during the most trying season for growing crops. The deposit of snow on mountain ranges is said to be above the average of the past half-decade, which will give a good supply of water for mining purposes well towards the close of the summer months. With the above leading industries greatly benefited, there can be no question of its having a favorable influence on all branches of manufactures and trade in general.

The local money market continues to work on easy lines, which is quite a departure from the closing week in former years. This ease shows that bank failures in the Middle States have no unfavorable effect with us and points to a general easing in the rates of discount after January. We are informed that the banks have a liberal supply of available funds which will be added to on quite a large scale after the January disbursements. In this city there will be paid out next month by the National Government, State, municipalities and incorporated companies sums of money aggregating several million dollars. While considerable of this will be sent out of the city, yet the bulk will remain here for investment.

At the East advices continue to come to hand of bank failures, but singular to state this has not caused many failures with either merchants or manufacturers, which should be convincing proof that the banks were not moneyed on conservative lines and therefore their suspension did not cause much surprise. Aside from this it shows that the other banks were well provided with funds so as to tide customers of suspended banks over an emergency. Then there is another consideration which looks quite favorable and that is the improved prices for grain made it possible for the trade to make closer collections by which they have been placed in better financial position. In commenting on the New York money market a leading exchange at that city says: "Money brokers are unanimous in their statement that recent bank failures have failed to affect the local market in any appreciable extent. There is not the least approach to apprehension or excitement in this market, and the demands for currency for the west have been so small as to have been without any power to affect banks here. It would take, in the opinion of some good authorities, the loss of at least $10,000,000 of the surplus reserve to improve money rates at this centre permanently. So far as can be seen, there is very little probability of any such loss, and there is all the time hanging over the market the payment of interest on Government debt at the beginning of the year, greatly increasing the supply of funds."

New York Silver Prices.

NEW YORK, Dec. 31.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
*Friday	....	....
Saturday	29 15-16	65¼
Monday	29⅞	65⅛
Tuesday	29⅞	65⅛
Wednesday	29⅞	65
Thursday	29⅞	65

*Holiday.

	Copper.	Lead.	Iron.	Tin.
*Friday	.....	.....	.....	.....
Saturday	11 40	3 05	11 00@13 00	13 00
Monday	11 40	3 05	11 00@13 00	13 00
Tuesday	11 45	3 02½	11 00@13 00	12 50
Wednesday	11 45	3 02½	11 00@13 00	12 50

*Holiday.

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.84½
London Merchants	$4.84
London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	65⅛
Mexican Dollars	51¼@52¼

SILVER.—The market has shaded off slightly in sympathy with a decline in London. The lower prices there are due to authentic advices that the India Council will offer on the market, next week, £1,500,000 Council bills. It is also unfavorably influenced by the usual mid-winter slow demand. At this writing it is hard to forecast the immediate prospects but it ought not to create surprise if slightly lower prices rule sometime in January, which, if it be the case, ought to be followed by an advance when the usual February and March demand sets in from India, the Straits and the Orient. The steamer Belgic sailed Tuesday for Japan and China with $278,900 in silver bullion.

MEXICAN DOLLARS.—The market was fairly active up to Monday under a demand for shipment to the Orient. The Belgic which sailed last Tuesday took out 351,983 dollars.

ANTIMONY.—Our market is quoted at 7½@8c in a jobbing way. New York mail advices quote 7¼c for Cookson's, 6½@6¾c for Hallett's and 6½c for Japanese.

QUICKSILVER.—The market has held to steady prices throughout the week. Shipments to Mexico and Central America aggregate the past week 250 flasks.

The market is quoted as follows:

Domestic trade, per flask.....36 50

For export, quotations are nominal but less than for home.

COPPER—The market has a strong tone, with sellers indifferent except at an advance. The East reports a continued free export movement, with the markets firming up.

John Stanton reports the copper production in the United States and of the foreign mines and of the United States exports as follows, in gross tons of 2240 pounds:

	Reporting mines.	Outside sources.	Total U.S. pdt.	Product foreign mines.	U. S. exp'ts
First h'lf '95	70,612	9,100	79,712	42,484	34,215
Sec'nd h'f '95	84,885	6,600	91,485	43,674	30,507
Total 1895	155,497	15,700	171,197	86,178	64,722
January, '96	14,372	1,200	16,072	6,834	8,166
February	16,316	1,200	17,516	7,096	8,296
March	16,722	1,200	17,922	6,910	10,892
April	15,912	1,200	77,112	6,865	10,684
May	15,533	1,200	16,733	7,495	10,481
June	14 825	1,200	16,025	7,055	9,797
First h'lf '96	94,180	7,200	101,380	42,255	58,216
July	15,395	1,200	16,595	7,847	10,885
August	15,600	1,200	16,800	7,022	9,119
September	15,777	1,200	16,977	7,182	10,898
October	16,958	1,200	18,158	7,297	11,371
November	15,165	1,200	16,365	7,106	12,034

During the first 11 months of the current year the production has been 186,275 gross tons, of which 112,523 tons, or 60 per cent was exported. In 1895 the production was 171,197 tons and the exports were 64,722 tons, or 37.8 per cent. The quantities retained for home consumption were therefore 106,475 tons in 1895, against a rate to date of 74,000 tons for 1896.

Ingot, jobbing	14¼@—
Ingot, wholesale	13½@—
Sheet copper	17 @—
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

LEAD—The market is slightly easier, but not quoted lower. At the East, under slightly more selling, more ease is reported.

Pig	—	@	3 75
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a good seasonable demand. Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

BORAX.—There is nothing new to report either in our market or those at the East. The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

TIN.—Pig is a shade lower in sympathy with lower prices for silver. The demand for both pig and plate is slack.

Pig, per lb	14¼c@	—	
Plate, I C coke, heavy, per box	—	@	$4 05
" " " light, "	—	@	3 95

IRON.—Our market for both pig and merchantable bar is practically unchanged. The call is slow. Eastern advices regarding pig iron are decidedly mixed. From all advices at hand it looks as if there will be strong competition selling for some weeks, or until a combination of the leading interests can be formed. The export movement of southern continues on a free scale.

We quote as follows:

	To Arrive.	Spot.
AMERICAN.		
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

LUMBER.—There is a continued free export movement. The domestic demand is slow.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is essentially unchanged. The market is quoted as follows:

Wire, carloads, basis per keg	....
" jobbing, " "	$2 75
Cut, carloads, " "	....
" jobbing, " "	2 50

COAL.—The market continues to strengthen for steam which has its influence on household. The light shipments on the way and very little, comparatively, to arrive within the next sixty days will probably cause still higher prices for cargoes on passage. There is a fair consumption demand.

SPOT FROM YARD—PER TON.			
Wellington	$7 50	@	8 00
Greta	6 00	@	6 50
Nanaimo	6 50	@	7 00
Gilman	5 50	@	6 00
Seattle	5 50	@	6 00
Coos Bay	—	—@	5 00

Mining Share Market.

SAN FRANCISCO, Dec. 31, 1896.

The mining share market the past year was a disappointment to the many, who had been led to believe there would be high prices on a genuine ore development in one or more of the mines on the Comstock lode. Judging from the work done it does not appear to be the fault of the superintendents, but rather the absence of ore bodies giving high assays in gold. It now looks as if work will have to be extended further to the west so as to see if the rich gold-bearing ore found near the surface years ago extends down to any considerable depth. That this can now be done is admitted by the better informed miners, who claim that the ground on the supposed west lode has been drained toward the northern end by the long west crossdrift run by the West Consolidated Virginia on out through Con Virginia ground; by the long Gould & Curry west drift toward the middle, that run by Bullion further south, while that which is being run jointly by Challenge, Confidence and Con Imperial will drain it well toward the Gold Hill group. Years ago Yellow Jacket drove a west crossdrift out a long distance, and reports were current at the time work was stopped that a body of high-grade gold ore had been struck. With what is supposed to be the west lode drained for a distance of several thousand feet and to a depth of over 1500 feet, it can be run far on upper levels, and if it is struck and found rich in gold then it can be developed at many points which would give a new lease of life to the Comstock mines. To do this it will take time and a large expenditure of money, and the latter means assessment, but the end would justify the means.

The low prices that ruled for the Comstock shares, with no life whatever to the market the fore part of the year, caused one of the most active brokers to join in with other operators to bring the Brunswick lode to the front. With this object in view they secured the cooperation of the mining companies on the Comstock whose ground is between Bullion and Ophir. These companies bought ground on that lode corresponding in size to that held by them on the Comstock. After the titles had passed and work began at one or two points the shares of Occidental began to exhibit life and under active trading made quite an advance from the low figure. Singular enough the shares of the other mines did not move up much in sympathy but sagged off. After sending Chollar down to 35 cents a share it began to show more activity and taking the lead made quite an advance, moving up to $3.10 a share, and then broke rapidly, fully 50 per cent, from this figure it recovered and moved up to $4.30 a share. In its movements Potosi sympathized more than any of the others owing to the work in Chollar being towards it. The upmove was manipulated on reports of ore development which was verified by mining superintendents and some brokers. The latter might possibly tell galena ore from gold ore but not mica from gold, yet their opinions were published and brought in outside buyers and also caused nearly all the short sellers to fill at a heavy loss. After this the market began to decline and, with the exception of occasional rallies, has not stopped since, although within the past fortnight slightly better prices have ruled. Occidental, which sold for dollars at one time this year, is below 10 cents now, while Chollar, after selling at $4.30, went below 80 cents with a strong probability that before six months it will sell, assessments paid, below 50 cents, unless a genuine ore development is made. It looks at this writing as if the shares of the leading mines on the Comstock are sufficiently concentrated to admit of a small deal next spring, which may be done even if they do not find ore. Yet ore may be run into almost any day for the possibilities of the Comstock lode are not entirely exhausted and active exploiting work is being done in nearly every mine on the lode.

While the Comstock mining shares were active and selling at higher prices, the Bodie shares were more or less neglected, pending a consolidation under one name (Con. Standard) of Bodie, Mono, Bulwer and Standard. It took several months to bring it out, but it is so far advanced that it can be said to be practically accomplished. Lately the Bodie and Bulwer shares have shown strength and sold at higher figures. There can be no doubt that, under the consolidation, work can be carried on to a much better advantage, and, with improved methods of mining and milling, dividends will be paid. But, when speculative mines pay dividends, they become investment propositions, and, as such, the market value of the shares do not make rapid fluctuations, and, when this is the case, they are not attractive to those who buy and sell for a gamble.

The inactivity of the market, with slow, dragging prices, does not cause disappointment. It has been many years since any show of activity was manifested during the mid-winter holidays, and even then there was no pending meeting of the California Legislature. The writer has never seen an active, higher and fluctuating market while the Legislature was in session, and if there is during the coming session it is more than experienced dealers look for. The cause for a slow market and depressed prices at that time is probably owing to the fear of manipulators and mine managers inviting adverse legislation. So far as official letters from the mines go there is nothing of an encouraging character, for about all they contained is skeletoned, as if the meat had been taken off and the bones thrown to the public. Private advices from seemingly well-informed sources are of rather an encouraging character, but they point to time before favorable results can be expected to follow the work which is being done. It may take from one to two lines of assessments to pay expenses while prosecuting the work to given points in several of the mines, but it is reasonable in the interim to look for spurts in the market so as to induce holders to pay assessments.

In the Bodie group of shares dealing has been confined almost entirely to Bodie and Bulwer. It is the opinion that next spring there will be more activity in these shares, for the outlook in that district is quite en-

THE SANTA ROSA GOLD MINING COMPANY.

Take All the Advice : : : : : :

On advertising you can get; but don't act on it unless it appeals to your own judgment.—Printers' Ink, N. Y., Dec. 2, 1896.

couraging for dividends. Soon after a consolidation of Standard, Bodie, Mono and Bulwer is an accomplished fact, with but one stock on the market, more activity is looked for in it than in all of them at the present time.

Notwithstanding that the history of the share market has been such as to warrant asserting there will be no active and higher prices while the California Legislature is in session, yet there are persons claiming to have sources for securing the best of information who are firm in the conviction that before January passes the market will range considerably higher than it ruled to-day. This, they believe, will be done purely on manipulations and bull points, with little or no merit to back it up.

From the Brunswick lode there is nothing of particular interest to note. In Occidental they are sinking on an ore streak from the 550-foot level. On the 750-foot level they are running a southeast drift. In Chollar they are about ready to start two crossdrifts on the 400-foot level south of those they have been running. They are in hope that these drifts will show more ore, and of higher grade, than did the other two. We are not advised as to the work on the 500-foot Hale & Norcross shaft level. In the latter mine no work is being done. In Savage they continue work on the level reported last week. In Best & Belcher and Gould & Curry work is continued on the 300-foot, and also tunnel level. So far the work in these two mines has not come up to expectations, provided official letters have not been misleading.

From the Comstock mines the official letters continue to report more or less active work in the different mines except Crown Point, Kentuck, Exchequer, Chollar and Potosi. Although no work has been done, so far as official letters are concerned, in Kentuck and Exchequer for a long time yet they do not neglect to work shareholders for money by levying assessments. It creates the impression that there must be a large line of shares out and by stopping work but not stopping assessing they can be bought at low prices before a good sized deal. That the latter will come is as certain as the Comstock lode exists, but not until the powers that be have all the shares they want, for it is not human for moneyed men to make money for others unless they get the lion's share. The letters filed this week indicate that in Alta they are preparing to lose sight of the streaks of ore which it was thought would lead up to a big development of gold bearing ore. In Overman they manage to raise a few tons of ore each week while prosecuting exploiting work on a small scale. Seg. Belcher and Belcher continue to raise a few tons of ore but the letters are still silent from what level the ore is extracted. Nothing is reported from Crown Point and Yellow Jacket.

In Confidence they continue to raise a few tons of ore while doing exploiting work. No work is being done by Challenge. In Consolidated Imperial the long joint west crossdrift of Confidence, Challenge and Consolidated Imperial is being pushed ahead at a snail's pace. Slow work is also being done in the other west crossdrift. In Alpha they are still doing procrastinating work, as if to see how long it will take them not to do what it is expected they should do. The work is on the 550-foot level to the west.

In Bullion they are still pushing toward Potosi. In the latter mine, and also Chollar, work was stopped just as it began to look as if enough ore would be found to more than pay expenses.

In Hale & Norcross work is confined to the 900-foot level. Mining men are quite hopeful that quite a body of ore will be developed before many weeks pass. In Savage the work is mostly of a kill-time character. Nothing is expected to come from it. Gould & Curry and Best & Belcher are still pushing ahead, but slowly, the joint east crossdrift from the 800-foot Bonner shaft.

The work in Consolidated Virginia is not attracting much attention. It is thought that another assessment will have to be levied and collected before the work will be far enough advanced to show to much advantage in the way of ore development. The work is still continued on the 1000-foot, 1650-foot and 1750-foot levels. No ore was raised last week.

In Ophir the work is to the west, both on the tunnel and 1000-foot levels. In the official letter nothing new is reported.

In Mexican work is still continued on the 1000-foot level. In Union, Sierra Nevada, Utah and Andes the work reported is on the same levels and direction given in last week's review. Private advices, it is said, report that very important work in the west is being done in one of the mines, but official letters are silent on the subject.

From the Bodie district nothing new is at hand, and none looked for until towards next spring.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 22, 1896.

573,805.—PADLOCK—G. L. Baker, Waterford, Cal.
573,651.—WRENCH—L. J. Hall, Bourne, Or.
573,593.—ENGINE AND HARVESTER—B. Holt, Stockton, Cal.
573,605.—ODORLESS CREMATORY—C. W. Lent, Oakland, Cal.
573,824.—PLOW—E. J. Lotze, Northport, Wash.
573,828.—VELOCIPEDE—S. E. Maxon, Portland, Or.
573,722.—PROPELLER—J. H. McDonald, Olympia, Wash.
573,521.—PRINTING FRAME—Moore & McLaughlin, Los Angeles, Cal.
573,611.—EJECTOR—Wm. Muir, Michigan Bluff, Cal.
573,832.—DREDGER—C. H. Olsen, Tacoma, Wash.
573,698.—EXCAVATOR—Phillips & Stebinger, Portland, Or.
573,702.—WRENCH—Richard & Colman, Bisbee, A. T.
573,540.—AIRSHIP—E. J. St. Croix, Seattle, Wash.
573,550.—GLOVE BUTTON—J. Steinberger, S. F.
573,725.—GUN SIGHT—C. G. Thunen, Oroville, Cal.
573,562.—PROPELLER—F. Wittram, S. F.
26,423.—DESIGN FOR VIOLIN—E. N. Livermore, Port Townsend, Wash.
26,424.—DESIGN FOR MANDOLIN—E. N. Livermore, Port Townsend, Wash.
26,427.—DESIGN FOR CARD MOUNT—P. J. Scuparich, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

METALLIC FURRING FOR BUILDINGS.—John T. McCormick, San Francisco, Cal. No. 573,158. Dated Dec. 15, 1896. This invention relates to an improvement in what is technically called a furring or support for lathing and plastering, which form the interior walls and ceilings of buildings. It consits of rectangular bars crossing each other, those extending in one direction having slots perforated in them to receive those extending in the other direction, the latter being twisted and interlocked at the point of junction, and both sets of bars standing with the edges in the same direction. Curved clamps or hangers have one end adapted to engage the girder flanges, and the other ends bent to engage and interlock with the bars.

CONSTRUCTION AND PROPULSION OF VEHICLES.—John Gambetta, Stockton, Cal. No. 573,214. Dated Dec. 15, 1896. This invention relates to improvements in vehicles, and means for propelling them. It consists of a wheel shaft having pinions mounted thereon with clutch mechanisms whereby rotation in a forward direction will engage them with the shaft, and rotation in the opposite direction will disengage them therefrom. Toothed rack bars engage the pinions, and have mechanism by which they are reciprocated, so as to apply power to rotate the wheel shaft, while supplemental vertically movable rack bars engage pinions upon the wheel shaft, and have wheels journaled in their lower ends to form contact with the ground when passing over irregularities in the surface, so that the supplemental racks are moved and power applied through them. In conjunction with these devices is a brake bar having a pair of rollers, one above and one below each end and arms connecting the brake bar with the knee levers through which, by a foot piece, the brake may be applied.

Information Wanted.

TO THE EDITOR:—Can you, or any of your readers, give me any information concerning the Earl Gold Reef Mining Co. and the King of the Rockies mine, or Mining Co., i. e., where their properties are situated, whether either of them have ever paid a dividend, whether it is likely that they will ever pay dividends, under what management is either company operating, or are they in operation at all, at this present time? E. D. G.

Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

Assessment Notices.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

CON. CALIFORNIA AND VIRGINIA MINING Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of December, 1896, an assessment (No. 7), of 25 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 4th day of February, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

HALE & NORCROSS SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 8th day of December, 1896, an assessment (No. 110) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 3, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 11th day of January, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 1st day of February, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

R. U. COLLINS, Secretary.

Office—Room 3, Stock Exchange building, No. 331 Pine street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 14th day of December, 1896, an assessment (No. 80) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of January, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 9th day of February, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada Block, 309 Montgomery St., San Francisco, California.

HARTMANN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Chili Gulch Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of December, 1896, an assessment (No. 1) of 5 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 46, No. 4 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of February, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 23d day of February, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

G. W. PEER, Secretary.

Office—Room 46, No. 4 Montgomery street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from C. C. Beever, in the Union mine, near Brownsville, Yuba county, to deposit tailings in a ravine below the mine; from C. P. Saxton, in the Saxton mine, near Geneses, Plumas county, to deposit tailings in Little Grizzley creek; from O. D. Campbell, in the Sailor Flat mine, near Blue Tent, Nevada county, to deposit tailings in Sailor Flat canyon; from W. H. De Mott, in the Blue Tent mine, near Blue Tent, Nevada county, to deposit tailings in an old pit; from Mathias Diehl, in the Frank Milan claim, near Camptonville, Yuba county, to deposit tailings in Mill creek; from R. M. Cunningham and Thomas Phillips, in the Montre placer mine, near Pike City, Sierra county, to deposit tailings in a ravine below the mine; from Cy. Mulkey, in the Cedar Creek Consolidated mines, near Fair Play, El Dorado county, to deposit tailings in Cedar creek; and from Al. Petty, in the Lucot mine, near Volcano, Amador county, to deposit tailings in a ravine below the mine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on January 4th, 1897, at 1:30 P. M.

EDWARD L. HALLAWELL,

115 and 117 Main Street (2nd floor),

SAN FRANCISCO, CAL.

Millwright and Engineer.

Contractor for the erection of Stamp Mills, Roller Mills, Reduction Works, Saw Mills (both circular and band), Aerial Wire Rope and Surface Tramways, etc., etc. Putting in machinery, shafting, etc., of all kinds promptly attended to. Estimates given on plants, complete, including machinery, building material, etc.

DIVIDEND NOTICE.

The German Savings and Loan Society,

526 California Street.

For the half year ending December 31, 1896, a dividend has been declared at the rate of four and twenty-six hundredths (4 26-100) per cent per annum on Term deposits and three and fifty-five hundredths (3 55-100) per cent per annum on Ordinary deposits, free of taxes, payable on and after Saturday, January 2, 1897. GEO TOURNY, Secretary.

British Columbia.

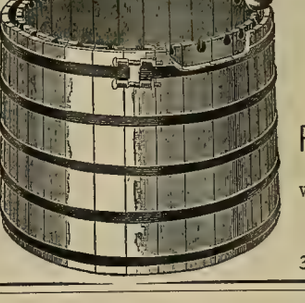
W. J. R. COWELL, B.A., F.G.S., Mining Engineer,

Reports on mines, designs and superintends the erection of mining and milling machinery; makes analyses of ores, metals, soils, etc.; arranges for mill tests, and selects suitable processes for the treatment of ores. Correspondence invited. Address W. J. R. COWELL, Victoria, B. C.

PROMOTER WANTED.

For a great mining enterprise. New region, Cascade mountains, Pacific coast. Extensive deposits of copper ores, containing gold and silver. Red Cripple Creek gold ore. Best discoveries secured by numerous claims, and opened; their value is a fact. Timber, water powers, coals and fireclay in abundance. A rare opportunity for an enterprising, moneyed and influential man. Partnership desired. References given and expected. Address "Promoter," this paper.

WANTED.



A Large Gold or Copper Property, located anywhere from Alaska to Mexico. Must have ore body developed 200 to 300 feet deep, with a large amount of payable ore actually in sight. Or a property with a large body of payable ore exposed sufficient to warant extensive development work. No small property wanted. Send complete description to M. KUHN, 12 Front St., San Francisco.

Wanted, Position

In Gold, Silver or Copper Mine as Underground Foreman.

Twenty years' experience. I speak Spanish, and know how to handle men. Don't object going to Mexico. Address "Foreman," this office.

WANTED.—Position as assayer, or charge of mill or mine. Have practical experience in amalgamation, concentration and mining. Had thirty years' experience. Can give best of references. Address "Assayer," 1212 South O Street, Tacoma, Washington.

24-26 MARKET ST., - - - - CHICAGO.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.
(Successor to ADAMS & CARTER), 132 Market St., Room 15, San Francisco.

RISDON IRON WORKS,

Office and Works: Cor. Beale and Howard Streets, San Francisco, Cal.

READ WHAT MINERS THINK OF THE BRYAN PATENT ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY,
S. BAMBERGER, President and Manager,
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO,
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. MCIVER, President.

No. 1905.—VOLUME LXXIV. Number 2. SAN FRANCISCO, SATURDAY, JANUARY 9, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Gold Yield of 1896.

Telegrams from Washington announce that the Director of the Mint estimates the production of gold in the United States in 1896 to have been about $51,500,000. Yet the tables of output from the different States and Territories given out by the Mint officers would indicate an output of about $54,000,000. The gold yield of 1895 was placed by the United States Geological Survey at $46,610,000.

Statistics are nearly always more or less unreliable, and when the final figures come from the Director of the Mint they can only be considered as generally approximate. Incompetence and carelessness on the part of those who gather data for the Government or the State is partly the reason why statistics are not more accurate, and yet probably the main cause is the impossibility of gathering all the facts and figures. An example of carelessness is shown in the table of the returns of gold and silver produced in the counties of California in 1894 and 1895 in the State Mineralogist's report lately issued. Neither he nor the able statistician of the Mint can probably be blamed, however, as the faults are due, no doubt, to the Mint employes and those who make up data for other sources of information. The point referred to in their tables is that no returns are made of silver from such counties as Siskiyou, Sierra and Plumas for 1894. Yet those who send bullion to the Mint from those counties receive in the returns a small percentage of silver on every shipment. The amount is not large, but it should certainly be considered. Then there is evidence in the figures themselves that in other counties all the silver received from them has not been credited to the output figures of that metal. Take Placer, for example. The returns of silver for 1894 was $664.37 and of gold $1,851,214.52, and, for 1895, silver $5,272.53 and gold $1,599,634.79. It is hardly possible that the proportion of silver increased so much in the gold bars sent to the Mint, but that the returns were not properly kept and tabulated.

The information given out by the Director of the Mint at Washington would indicate that the yield of Colorado has fallen off over $1,000,000. As to California the figure given is about what has been estimated by the most conservative here—$16,500,000—and is probably only a guess, as little data has come in.

Nevada and Arizona are credited with doubling their outputs, and, excepting Colorado, there has been an increase in each State and Territory. The lowest estimate of the Director of the Mint would show an increase in the yield of gold of about $5,000,000.

As to silver, the Director's returns would indicate a decrease in the output of about 2,500,000 ounces. Utah makes the largest gain, while there is a heavy falling off in Montana and Colorado.

It is stated in the Virginia City papers that a number of capitalists are investigating a proposition to drain the American Flat country by extending a branch of the Sutro tunnel from the main line at the Crown Point mine or the Alta. The length would be about 8000 feet. It is claimed that this would open up some thirty or forty mines on American Flat from which the miners were driven away by large floods below the 500 and 600 levels many years ago.

Sawmill Run by Electricity.

On this page and on page 32 of this issue is illustrated the only sawmill in the world run wholly by transmitted electricity. It is at Folsom, Cal., the property of the American River Land and Lumber Co., and the power is furnished by the Sacramento Electric, Gas & Railway Co., which supplies Sacramento with electric light and power, by the famous transmission plan recently illustrated and described in these columns. The mill is a band mill of 50,000 feet capacity, ten hours run. The sugar pine is cut in the Sierras, railroaded to a chute down which the logs drop half a mile in twenty seconds, into a deep still-water basin formed by a dam on the south fork of the American river, forty-two miles from Folsom, whence they are driven to the booms just above the Folsom dam and thence by canal 1½ miles to the mill, the canal also supplying the water to drive the electric generators. The electric power comes from a switch panel in the main power house of the Sacramento Electric, Gas & Railway Co., 600 feet from the mill, through three No. 1 B. & S. gauge wires. The induction motors at the sawmill are on the first floor; a 75 H. P. motor runs the large band saw, one of 50 H. P. runs the edger, smaller ones supply power to the log roll, sawdust and slab conveyors, log carriage, trimmer, live rolls, etc., which are on the floor above.

FOLSOM ELECTRIC SAWMILL—THE FIRST SAWMILL RUN WHOLLY BY ELECTRICITY.

In the filing room a small motor runs the machinery there. Transformers supply the voltage and the 150 lights. The electrical plant was put in by the General Electric Co., the sawmill machinery was supplied by the E. P. Allis Co.

Of the American River Land and Lumber Co., A. J. Ralston is president, H. P. Livermore manager, Joshua Barker secretary, Chas. E. Livermore, Albert Gallatin, John and James Treadwell associates. The fact that it is the first sawmill in the world to be wholly run by electrical power warrants its illustration.

TABLE OF CONTENTS.

LLUSTRATIONS.—Folsom Electric Sawmill—The First Sawmill Run Wholly by Electricity, 25, 32.

EDITORIAL.—Gold Yield of 1896; To Drain the American Flat Country; Sawmill Run by Electricity, 25. Deep Mining in California; The University and the Mining School; The Proposed Mining Laws; Is Foreign Capital Needed for American Gold Mines? 26.

SCIENTIFIC PROGRESS.—Aluminum Manufacture; Compressed Air Productive of Economy; Transmission of Earthquake Motion; Explosibility of Acetylene; The Most Powerful Lighthouse in the World, 31.

MECHANICAL PROGRESS.—A Novel Method of Mining; Effect of Concussion on Cast Iron; A Railroad Upon Which Cars Are Not Used; War Locomotives; A Unique Engineering Feat; Using One Kind of Oil, 31.

ELECTRICAL PROGRESS.—The Principle of Cataphoresis; The High-Speed Electric Locomotive of the Future; The Four Largest Dynamos Yet Built, 32.

PRACTICAL INFORMATION.—Making a Half-Tone; A Novel Method of Removing Boiler Scale; The Manufacture of Incandescent Lamps, 32.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 34-35.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 42.

MISCELLANEOUS.—Concentrates, 27. Responsibility for the Debris; Prince Hilkoff on Siberian Mines; South Carolina's Mica; Possible Coal Exhaustion in England, 28. The Solution and Precipitation of the Cyanide of Gold; Nevada City District Geology, 29. Gold Mining in Mexico; Edison on Diamond Making; The "House Organ," 30. To Sink Three New Shafts, 32. Coast Industrial Notes; Recent California Mining Incorporations; Personal, 33. Recently Declared Mining Dividends; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 43.

Deep Mining in California.

The fact that the Kennedy mine, in Amador county, has reached a depth of 2200 feet, where the ore is as rich and the ore body as large as in any of the upper workings, is of importance to miners along that gold belt. The ledge is 30 feet in width at that point and it has been determined by the company to sink 200 feet additional. The greatest depth heretofore attained in any California gold mine was 2182 feet, in the Idaho mine at Grass Valley. With the exception of mines in Victoria, Australia, the Kennedy is probably the deepest purely gold mine in the world, unless since the last monthly report the Robinson Deep, in the Rand, in South Africa, has made considerable headway in sinking.

The great improvements made in hoisting machinery and the reductions in the cost of raising ore within a few years past has given a great impulse to sinking deep shafts. The main obstacles to deep mining are the decrease in the amount of ore that can be lifted per day, the increase in the pressure and temperature at great depths, and the increase in expenditure. The first obstacle is becoming less with improvements in machinery and methods of hoisting, and the last obstacle is being partially overcome by reductions in expenditure per ton in mining, handling and milling ores. At present these obstacles will not prevent sinking much deeper than the Kennedy has gone, provided ore can be found.

Is Foreign Capital Needed for American Gold Mines?

Enough is known of the gold yield of 1896 to make certain that the greatest increase of output has been in the United States. Africa and Australia barely hold their own, while the yield in this country will exceed that of 1895 by probably at least $10,000,000. Yet in none of the other leading gold producing countries of the world has so little capital from Europe been invested.

English capitalists finding less opportunities for investment in Africa and Australia, have turned rather to British Columbia and South America than to this country.

The fact that in these hard times, and in an election year, when money was tied up more than usual, the gold mines of the United States were so energetically developed and worked, mostly by local capital, as to increase the yield by over 20 per cent, while all other leading industries were depressed, must give food for thought. A much greater amount of new capital was put into the mines of Australia and South Africa than in those of the United States, yet they barely hold their own in yield.

A great deal is said in papers published in mining districts about the value of inducing foreign capitalists to come in. But is this wise? The very fact that, in such a bad year for interesting money in anything as 1896, local capital has done so much, would indicate that outside help is not so very necessary.

If our mines are developed by our own people it will mean that the profits will remain here. That outside capital is needed for British Columbia, for South Africa and for Australia is evident; but is that true of this country? The Russian Government and others jealously guard this source of wealth from foreigners. The local capitalist who invests money in developing mines surely is doing much more good than one who induces foreign capital to come in and drain from our greatest source of wealth.

The University and the Mining School.

The University of California will ask from the State Legislature, now in session, for direct appropriations of certain sums of money or for an increase in the annual tax levy, for an enlargement of the regular income of the institution. This is a matter that, under present circumstances, should particularly interest the mining industry and the members of the Legislature from the mining counties of the State.

The Federal Government has made large appropriations of public lands, particularly for the establishment of agricultural colleges. California has received from the sale of these lands more than any other State in the Union. As a result—with private gifts and appropriations made by the Legislature—the greatest State institution of learning in America has been built up in Berkeley. Because so much was at first appropriated directly for the agricultural college, more has been expended in that direction than in any other, and to-day California has the best agriculture school in the world, with one of the most distinguished men in agricultural chemistry at its head. Naturally it would be expected that California would do more for a mining school than for any other practical branch in the University, yet less has been expended upon the mining school at Berkeley than upon any other of the scientific colleges, although there are more students in the mining school than in any other scientific college in the institution. However, this is the fault of the miners themselves. They have not asked the State for special appropriations for the mining school.

Now Mr. Reinstein, who was lately appointed a Regent, believing that some return was expected of him for what he considers an honor, has secured promises of bequests that aggregate over four millions of dollars from different individuals. A large proportion of this money—nearly all of it, in fact—will be given for specific purposes. This means that the State or the University must go to some further expense to make available the gifts offered.

Mr. Reinstein appreciates the fact that if the agricultural, the mining college and other colleges of science are first built up, the true foundation of a great university will have been laid. Most of those who have offered their contributions are of the same mind, and of the large sums to go to the University enough will be specially devoted to the building up of the School of Mines to make it the best in the world, provided something is done by the State. Any gift for a specific purpose naturally entails an extra expense on the University; but, as it is small in proportion, should be ungrudgingly given by the State. So far the State has built up a University that has cost about $10,000,000. Yet of all this over four-fifths has been given by the Federal Government and by private individuals. No other public institution is of more value or greater credit to the State. Of the students who have been educated at Berkeley, over a third could not have gone there had there been charges for tuition such as those at Yale or Harvard.

THE United States Geological Survey's report, covering the mineral resources of the country, shows that in nearly every branch of the iron and steel industries last year's production was the largest on record. Pig iron enlarged 2,788,920 tons, and iron and steel rolled into finished forms 1,547,363 tons. The distribution of the varied industries shows a wide area. Rolling mills are found in 30 States, and blast furnaces in 24.

The Proposed Mining Laws.

There has been a good deal said about the trouble that would ensue from claim jumping in all the Western States and Territories on the first of January of this year, owing to failure to do the required assessment work. In point of fact, there has been very little trouble—less than there was a year ago—simply because the locators have been exceedingly careful to place themselves in strong positions of defense by doing the necessary work in advance. In many cases mine owners have gone to the expense of employing lawyers to tell them what should be done in order to retain title. Again, in many cases claim owners have expended more than was really necessary, simply because they did not know what the law required and could not find out through their attorneys or any other sources of information what was necessary to be done in order to perfect title.

Altogether, this is a hardship entailed upon the mining industry—particularly those who enter it with honest intent—caused by the State and Territorial Legislatures in failing to provide proper laws or statutes supplementing the statutes of the federal government.

The MINING AND SCIENTIFIC PRESS in November last proposed some bills for the consideration of the State Legislature of California to remedy this evil. Those bills were endorsed by the recent convention of the California State Miners' Association and have been recommended for passage by the Governor of California. Their publication has attracted the attention of papers published in mining districts of all the other States and Territories in which mining is conducted. In some of them part of these proposed laws are now in force but others are not. The fact that the passage of those not already in force in other States and Territories is advocated is the best evidence that can be offered of their value. As published in the MINING AND SCIENTIFIC PRESS and offered for the consideration of the Legislature, they were presented with the expectation that changes would be made—particularly as to minor details. Little claim for originality can be made, for the reason that nearly every article in all the proposed laws is now upon the statute books of some State or Territory and has been found to give good results.

One objection will always be made to these, or any other laws proposed as to locating mines and perfecting titles, and that is that too much is required of the locator. He would be compelled to put up a certain number of stakes and do a certain amount of work, such as sinking a shaft or running a tunnel, immediately upon locating his claim. The only people who can make reasonable objection to this are the old prospector, who is too lazy to do the required work, and the man who wants to take up a large number of claims at as little expense as possible and wait for some one to come and buy him out.

The proposed laws would give a needed protection to the earnest and honest miner against these classes and would do much to discourage claim jumping and prevent uncertainties in mining titles.

Upon this subject the Governor in his message to the Legislature last Monday wrote as follows:

It is well known to all miners and mining lawyers that the laws relating to the location, relocation, and manner of recording lode and placer claims, the work necessary to hold possession thereof, and the right of co-owners, are very unsettled; that their rights to liens thereon are uncertain and most unsatisfactory. The United States Government recognizes miners' laws and customs where there are no statutory provisions governing the same.

The miners' convention, at its recent session, appointed a committee to propose new laws, or revise the existing ones, on these and kindred subjects, and they will cause bills to be prepared for your consideration. Considering the high source from which these measures come, I recommend their most careful consideration, and when so drawn or amended as to remove the uncertainty existing and to give relief to prospectors and miners, and stability and record to their claims and proper liens thereon, that they be passed.

Concentrates.

THE Mercur, Utah, mine paid $225,000 dividends in '96.

THERE are coal mines opened in every county in Wyoming except one.

IN Wyoming during 1896 there were 378 gold mining locations made.

THERE were produced in the United States, in 1896, 77,000 tons of zinc.

THE November South African gold exports aggregated in value $3,437,645.

THE Copper Queen Mining Company of Bisbee, Arizona, employs nearly 800 men.

THE mineral entries in Utah in 1896 show a considerable increase over previous years.

THERE were shipped from the Nova Scotia mines in 1896 about 140,000 tons of gypsum.

THE Oregon Legislature will establish a School of Mines in the eastern part of that State.

THE output of gold in Tuolumne county for 1896 is estimated by the *Union-Democrat* as nearly $2,000,000.

THE new Spokane Stock Exchange has been incorporated and is expected to begin business in a few days.

THE Spokane *Spokesman-Review* estimates the yield of the Cœur d'Alene, Idaho, mines for 1896 at $5,000,000.

A TELEGRAM from Santa Barbara announces that a gold discovery has been made in Smith's canyon, six miles from that city.

IT is the intention of the owners of the Mercur mine in Utah to increase the daily capacity of the mill from 200 to 300 tons.

THE silly season in mining is not quite over. A ledge 800 feet wide has been discovered in Idaho that will assay from $3 to $7.

THE yield of gold in Australia and New Zealand for 1896 is estimated at a slight increase over that of 1895, which was $42,793,824.

THE 10-stamp mill at the Richenbar camp, sixty miles north of Phœnix, is the only quartz mill in Arizona that is run by electricity.

THE yield of gold in the Rand, South Africa, in 1896 was 1,860,771 fine ounces, against 1,858,650 for 1895, a gain of 2,121 ounces.

THE output of quicksilver in the United States in 1896, all from California, was 33,012 flasks, a decrease from that of 1895 of 966 flasks.

BULLION handled by the Denver branch mint in 1896 was: Gold, $4,218,861; silver, $27,373; total, $4,246,234. Last year's total was $4,280,286.

THE reports and estimates would indicate that the world's yield of gold for 1896 was about $220,000,000, against about $201,000,000 for 1895.

OIL has been discovered near St. David in Cochise county, Arizona, but it has not been demonstrated whether it is in paying quantities or not.

THE bulk of the nickel of the world came from Canada last year. Matte and ores amounting to 3,697,000 pounds were imported into this country.

THE Vulture mine in Arizona has been placed on the London market at the rate of $1,000,000, through a company formed with that amount of capital.

A NUGGET weighing sixty-four ounces was picked up last week in southern Oregon, but part of it was quartz and its value in gold was about $500.

THE gold output of South Dakota for 1896 is estimated by the State Mine Inspector at $6,178,675, against $4,910,000 for 1895, an increase of $1,268,675.

ADDING the dividends paid and the returns of net profits of close corporations and private properties, the earnings of the mines of Utah for 1896 were $2,161,771.

TO DATE there have been 239 applications to the U. S. Debris Commission for permits to work hydraulic mines in this State, of which 161 have been granted.

SEVERAL veins of coal have been discovered in Rogue river valley in Oregon and the work done, it is claimed, shows that they may become of considerable value.

IMPORTS of specie from Mexico in 1896 were $7,830,254 in dollars, $1,163,684 in silver bullion and $824,644 in gold bullion. Total, $9,818,582, against $9,350,460 in 1895.

AT the United States Assay Office at Boise, Idaho, the mineral output of Idaho for 1896 is placed at: Gold, $4,275,665; silver, $5,777,848; lead, $3,090,117; total, $13,143,630.

A DISCOVERY has been made of corundum in Hastings county, Ontario, Canada, which the Geological Survey believes may be made of immediate economical value.

THE owners of the Leon mine, south of Perris, Cal., contemplate erecting a 10-stamp mill on the property. They have considerable ore on the dumps, including some telluride.

IT is estimated by the mint authorities that the gold yield of Nevada for 1896 was $2,955,000, against $1,552,200 for 1895, and of silver 772,000 ounces, against 956,200 ounces for 1895.

ACCORDING to the last estimate of the Director of the Mint in Washington the product of Alaska in gold in 1896 was $3,249,000 as against $1,615,300 in 1895 and in silver 77,300 ounces.

A THREE-QUARTERS interest in the Caledonia mine of Cripple Creek has been sold in London for $576,000 and several other properties controlled by the same people are under negotiation.

THE work of development in Ragged Top, the new district in the Black Hills, South Dakota, is being pushed forward in many mines and there have already been laid out three townsites.

THE ore shipments from British Columbia entering the State of Washington through the Northport custom house from June, 1895, to the end of November, 1896, was valued at $2,182,607.95.

THE Mineral Land Commission in Montana has reported that they have classified about 700,000 acres of land. Of this, in 1895, 20 per cent was declared mineral and in 1896, 4½ per cent.

SPOKANE, Washington, was in earlier days the center of many trails and wagon roads from parts of Idaho and Washington and can now be reached by five lines of transcontinental railroads.

OTTOMAR HAUPT figures that the net output of gold of the world last year, after deducting the amounts used in the arts, was probably $140,000,000. For the six years ending December 31, 1895, he reckons the net output, after making the same deduction, at $600,000,000. At the beginning of June, 1896, the visible stock of gold had reached the sum of no less than $2,300,000,000.

THE receipts of treasure at San Francisco through Wells, Fargo & Co.'s express for 1896 amounted to $29,362,874, of which $18,293,191 was in coin, $639,754 in silver bullion and $10,429,929 in gold bullion.

A NEW furnace at the New Idria quicksilver mine in San Benito county was destroyed by fire last week. The loss is estimated at $75,000 and a large number of miners were thrown out of employment.

A SYNDICATE composed of Standard Oil Company people some time ago obtained options on properties in the Deep Creek district, Utah, and after having done some development work are about to take them up.

ACCORDING to the Bingham, Utah, *Bulletin*, the output of the camp for 1896 was 54,016 tons of ore. Of this amount, the Dalton & Lark shipped 16,913 tons, the Old Telegraph 12,000 tons and the Old Jordan and Galena 8135.

THE Union Smelting and Refining Company has been incorporated under the laws of Washington for the purpose of erecting a smelter at Northport, near the British Columbia line, to work ores especially from the province.

AN effort will be made by Utah and other lead producers to have the duty on lead ores increased by Congress at the next session. The fall in the price of lead has affected Utah more than any other State or Territory during the past year.

THE combined capital of all the chartered gold and silver mining companies in Canada is over $200,000,000. By provinces the figures stand: British Columbia, $256,325,075; Ontario, $32,094,900; New Brunswick, $1,030,000; Manitoba, $50,000.

THE Tomboy, at Telluride, Colorado, cost June, 1894, $105,000. Up to Jan. 1, 1897, it paid $1,000,000 in dividends. If the sale to the Exploration Company for $2,000,000 is completed, the profits on an investment of $105,000 will be nearly $3,000,000.

THE manager of one of the largest Utah smelters says that he belives that in a very short time prices will advance, and that the advance would be to a figure which will justify the producers of silver-lead ores in again going forward with their energetic extraction.

THE output of San Miguel county, Colorado, for 1896 is placed by the Telluride *Journal*, on returns from the mint and the smelters, at $2,299,037 in gold and $705,040 in silver and lead—a total of $3,004,077. During the year 2039 carloads of ore were shipped from Telluride.

AN inter-provincial conference of Canadian mine owners and mining engineers will be held in Montreal on February 3, 4 and 5. Subjects for special discussion will be "The Total Abolition of Duty on Mining Machinery," and "The Removal of the Duty on Explosives."

ELECTRICITY has supplanted the mule as a motive power in handling the slag pots of the United Verde copper mines in Arizona. The prospector's old friend and companion is gradually being driven out of different means of earning an honest livelihood by steam and electricity.

UTAH owns over 7,300,000 acres of land granted by the Federal government, of which 5,760,000 acres are school lands, 126,000 University land, 200,000 Agricultural College land, 100,000 College of Mines land, 50,000 for a Miner's hospital and 500,000 for establishing reservoirs for irrigation purposes.

AMONG the early fairy tales of '97 is the Seattle project to build "a smelter at Gray's Harbor, Wash., to utilize the black sand so extensively found on the sea beach." When that is done the projectors can also build a solar engine, the power to be procured from sunbeams extracted from cucumbers.

THERE is a novel hydraulic mining plant on the Rogue river near Grant's Pass, Oregon. Two large pumps have been put in—one a centrifugal and the other a duplex Gardner. The latter provides water from the river for sluicing and the former for piping—forcing the water through a nozzle against the bank.

H. E. HUNTINGTON and a number of engineers of the Southern Pacific Company have been in Randsburg, Kern county, looking over the ground, with a view to building a branch from Mojave. People connected with the Atlantic and Pacific have also been looking over the county with the idea of building from Kramer.

THE Department of Geology of the University of California has issued a bulletin on "Two Tertiary Faunæ from the Rocks of the Southern Coast of Vancouver Island," by Dr. J. C. Merriam. The good work done at the institution is inducing geologists from far beyond the limits of California to send to it for determinations.

IN the San Carlos reservation, Arizona, since the segregation of part of the land, considerable prospecting has been done and several mining camps have been started. The ore is mostly copper carrying gold. In one district where large bodies of galena ore have been discovered there are evidences of work having been done centuries ago.

A RECEIVER has been appointed for the Siskiyou Mining Company in Oregon near the California line. It is a Maryland corporation and this action was taken to prevent attachment being laid by creditors before the copper ore on the dumps could be marketed. It is claimed that about $30,000 have been spent on the mines, and that there is on the dump $15,000 in copper ore and matte.

ESTIMATES of the output of mineral in Utah in 1896 made by Wells, Fargo & Co. are as follows: 3,561,860 pounds of copper, 73,430,060 pounds of unrefined lead, 8,728,705 ounces fine silver and 93,896 ounces fine gold. Computing the gold and silver at their mint valuation and other metals at their value at the seaboard, makes a total valuation of the product of $15,897,266, showing an increase of $1,377,377 over last year.

THERE has been greater increases in the yield of gold and copper in the United States than of other minerals. The output of copper exceeded that of 1895 by about 70,000,000 pounds and of gold probably nearly $10,000,000. The production of lead shows an increase of from 5 to 7 per cent, while the estimates of the Director of the Mint shows a falling off in the yield of silver of about 2,600,000 ounces.

AT the Moreno dam, in San Diego county, last week the Southern California Mountain Water Company fired a blast with giant and black powder that moved 150,000 tons of rock. This is said by the Los Angeles *Times* to be the largest blast in the history of the State. In 1878 a blast was fired in the Dardanelles mine in Placer county that moved 500,000 cubic yards of gravel. Nineteen tons of Judson powder were used, or what would be equal to about 75,000 pounds of black powder.

BETWEEN 1890 and 1895 the world's production of gold was increased 75 per cent. The gold production of the United States in 1895 was of the value of $46,610,000, and the silver production had a commercial value of $36,445,000. The increase in gold for the year was $7,110,000 and in silver $5,023,000. Officers of the mint service estimate for 1896 the product of gold $51,500,000, an increase of $5,000,000 over 1895; 52,000,000 to 53,000,000 fine ounces of silver, a decrease of 2,500,000 to 3,000,000 ounces.

AT a meeting of the mine owners in the new Ragged Top district, in the Black Hills, South Dakota, an organization has been formed mainly for the purpose of protecting themselves against professional claim jumpers and blackmailers. One of the articles of organization provides that whenever the mining ground of any member is jumped, he may appeal to the Executive Committee or any member close at hand for assistance and they shall immediately accompany the owner and eject the jumpers.

FAST time has been made in driving the new shaft in the Utica mine at Angels Camp. It is a three compartment shaft and the foreman, Gabe Price, announces that 140 feet were made in thirty days in December. There were three shifts of four men each, employing three machine drills. The rock, which is a hard gray slate, had to be blasted from one foot below the surface, and is considered as hard as any in the mines. It takes on an average twenty-four holes to put it down six feet, and dulls about eighty drills in that distance.

THE United States post office authorities are doing good work in the East in making an investigation of the methods of certain mining brokers in New York and other Eastern cities, who advertise in local newspapers and receive money to invest in certain stocks. It is claimed that the inspectors find that they keep a set of books for mail orders and that these are carefully doctored each day so that the victim is certain to lose. Many complaints of fraud have been made and the Government will take steps to suppress them.

THERE was more activity on the part of locators in doing the required assessment work before the end of last year than ever before. In a much smaller proportion of cases than usual did they trust to evading the law by making new locations. The professional jumper was in evidence but found poorer pickings than he did last year in all those States and Territories in which the State laws have not properly supplemented the Federal Statutes. After all the claim jumper is doing good missionary work in showing the necessity for good State and Territorial laws.

THE estimate of the output of Cripple Creek for 1896, made by Colorado papers, is about $10,000,000. The output for 1895 was about $8,000,000. Of this year's yield the Portland is credited with nearly one-sixth, or $1,600,000, and Stratton's Independence with $900,000. However, as the most conservative of Colorado papers admit that there will be a falling off in the total yield of the State from that of last year, the estimate in Cripple Creek is probably high. The output of silver, gold, lead and copper for the State is estimated variously from $34,000,000 to $39,000,000.

ESTIMATES of the mineral output of Arizona for 1896, the figures being mainly based on reports sent the Governor from different sections, are as follows: Gold, $6,000,000; silver, 2,100,000 ounces; copper, 102,000,000 pounds; lead, 2,400,000 pounds. The gold has come mainly from pyritic ores, a large amount being also production in conjunction with sulphuretic copper. Over half of the silver came from the county of Mojave, in the northern part of the Territory, from small properties. The copper came from the Jerome mine in Yavapai county, Old Dominion at Globe, Detroit Company at Clifton, Copper Queen mines at Clifton.

SOME New York, Chicago and Kansas City capitalists have lost a lot of money on worthless mining ground alleged to contain zinc and lead in Western Kansas. The assays presented by the promoters showed high grades of ore and options were taken on 100,000 acres of lands. The Eastern speculators are said to have spent $200,000 in the purchase, and a few weeks ago smelter machinery was bought. Excitement ran high, and the Kansas City speculators sent Prof. Howorth of the State University to the alleged mines to make an assay. He has returned and reports that only a trace of the mineral can be detected. The promoters have deserted the field.

ASSAYER-IN-CHARGE BRADEN of the United States Assay Office at Helena gives out the following figures as his estimate of the mineral output of Montana for 1896: Gold, $4,500,000; silver, 16,000,000 ounces; copper, 230,000,000 pounds; lead, 22,000,000 pounds. Compared with that of 1896, these figures show an increased output of about $200,000 in gold, a decrease of 1,000,000 ounces of silver, a decrease of between 2,000,000 and 3,000,000 pounds of lead, and an increase of 30,000,000 pounds of copper. This would make the total value of these minerals produced from the mines of the State, at the present prices of the metals, amount to the sum of $41,960,000.

THE Mountain Copper Co., Ltd., which has purchased the property of the Mountain Mining Co., Shasta Co., Cal., and of the New Jersey Metal Refining Works, Elizabeth, N. J., is an English corporation with a capital of £1,250,000. The stated purchase price is $6,750,000—$3,666,850 cash, $2,083,150 in paid-up shares. The latest expert report states that 84% of the samples taken average 8¾% of copper, and that there are 1,338,184 tons of ore in sight. It is figured that the present cost of the production of copper—£34 3s 4d per ton—can be reduced by £8 12s per ton when the company has its own plant, and that at the present cost of production there is a profit of £18 16s 3d on each ton of copper produced.

THE thirteenth report of the State Mineralogist has been published. A short account is given of the progress of work in mines of different classes in the State, including gold, silver, asphalt, borax, chrome iron, coal, magnesite, petroleum, quicksilver, asbestos, salt and others, and natural springs and the sources of structural materials. A large field has been covered and considering the small amount appropriated for the work a great deal of valuable information has been gathered. Besides this a number of special articles by well known authorities on subjects of interest to miners are included in the volume. Copies may be obtained by any citizen of this State by applying to the State Mineralogist, San Francisco, or forwarding 17 cents in stamps with his address. The price of the work to those living outside of California is $1.

Responsibility for the Debris.

Written for the MINING AND SCIENTIFIC PRESS.

There has been of late a revival of the question of the deposits of debris in the Sacramento river and its tributaries that has led to a discussion as to whether some other means than the building of restraining dams might not be of value to keep the streams clear. Now that much hydraulic mining has been prohibited since 1880, it appears to be timely to discuss the various phases of the matter, and particularly to show that the contention of the hydraulic miners that they were responsible only in small part for the evils complained of was in accordance with the facts, to the end that the duty of the State and of the Federal Government to act in the matter may be shown.

This and some papers to follow have been prepared for the MINING AND SCIENTIFIC PRESS by a competent engineer. The data is taken from acknowledged authorities and the estimates will be admitted to be conservative.

The first question is as to the amount of debris now resting in the Sacramento drainage system as shown by data published by various engineering corps and commissions on the subject.

The total amount of this material can be shown to be four times the amount that has been washed from the mines themselves. The question as to where the remaining three-fourths comes from naturally arises.

The following table shows the debris estimated to be lodged on the Sacramento drainage system with the authorities for the estimates:

Stream.	*Cubic Yards.*	*Authority.*
Yuba River, below De Guerre Point	308,000,000	Annual Report Chief Engineers, 1895.
Yuba River, between Smartsville and De Guerre Point	100,000,000	Annual Report Chief Engineers, 1895.
Yuba River—South. Middle and Main Forks	26,000,000	Annual Report Chief Engineers, 1891.
Sacramento and Feather Rivers, below Marysville	120,000,000	Annual Report Chief Engineers, 1895.
Feather River, above Marysville	34,000,000	Annual Report Chief Engineers, 1891.
Suisun Bay	477,000,000	Annual Report Chief Engineers, 1895.
San Pablo Bay	76,000,000	Ex. Doc. 98, 47th Congress, first session.
American River	45,000,000	Ex. Doc 98, 47th Congress, first session.
Bear River	122,000,000	Keys vs. Little York Cold W. & W. Co et al.
Cosumnes River	6,000,000	Ex. Doc. 98, 47th Congress, first session.
Total	1,314,000,000	

These estimates take no cognizance of the material lying immediately upon the mine dumps and in the lateral canyons and gullies, which is usually estimated to be one-third of the amount removed from the mines, or about 215,000,000 cubic yards, as will be shown later. This makes a total of about 1,529,000,000 cubic yards of debris in all.

The question now arises how much of this enormous amount of debris is due to the hydraulic miners. Two estimates have been made of the annual washings along the Sacramento drainage based upon the water used, at a certain duty per inch. They are as follows:

	Season 1878–79. Cubic yards.	*Season 1879–80. Cubic yards.*
Table Mountain Creek	3,556,000	2,919,375
Butte Creek		84,000
Yuba River	22,336,500	19,103,598
Feather River	12,687,500	4,407,770
Bear River	5,555,000	3,351,246
Dry Creek No. 2	680,000	132,687
American River	8,604,000	8,615,250
Totals	*53,404,000	†38,613,926

It has been claimed by many that these estimates are too high; but if we take the average of the two, we have 46,000,000 cubic yards as the annual washing during the latter part of the hydraulic mining period. A bit of corroborative evidence of the correctness of this estimate lies in the following. The result of washing over 110,000,000 cubic yards of gravel, given by A. J. Bowie‡, shows an average yield of nearly 11 cents per yard. The annual yield, therefore, from the hydraulic mines should be nearly $5,160,000. It will be shown elsewhere from other sources that the annual yield from hydraulic mines was not far from $5,300,000.

The total amount of gravel washed from the mines may be approximated. Hydraulic mining scarcely began until 1860, and gradually increased until 1881. Supposing that for the eleven years from 1870 to 1881 the annual washing to be 46,000,000 cubic yards, and from 1860 to 1870 one-half this amount, we have a total of 650,000,000 cubic yards washed from the hydraulic mines. This is surely a very liberal estimate, but this amount is but 42% of the debris calculated to be now resting below the mines.

In the well known suit against the North Bloomfield, the excavations of the mines were measured and the amount excavated determined to be 176,000,000 cubic yards. Yet the U. S. Engineers determined that in the Yuba alone there lies 434,000,000 cubic yards of debris. That is, the excavated gravel is but 40% of the debris. And in this debris is not considered the amounts in the Sacramento river down to the bay of San Francisco, nor that on the mine dumps.

The question as to what proportion of debris turned into the rivers passes into the sea or finds lodgment elsewhere than in the drainage channels, is open to much discussion. But, supposing that but 50% of the material turned into the main channels passes away as slickens—and it is usually estimated at 66%—then there has been 3,050,000,000 cubic yards of material placed in the rivers, of which but 21% can be laid at the door of the hydraulic miner. Some doubt may be entertained as to the approximate correctness of the estimates given, but they have been based upon surveys and data collected by impartial Government engineers, and must be accepted as the best obtainable.

The question therefore arises: Where does the remaining four-fifths of this debris come from?

The importance of natural erosion has long been underestimated in mining debris discussions. It may be asked why this erosion did not take place before mining began. To some extent it did, and the river had filled its channel a great deal through geological ages long before the hydraulic miner came on the scene. But the rate of this erosion has been enormously increased by the advent of civilization upon the slopes of the Sierra. The soil has been loosened by cultivation, by the building of roads and ditches and the removal of vegetation. The early placer miner ascended gradually from the main streams to their branches, and finally up the side gullies, loosening and stirring up the gravel and soil and sending it to the lower channels.

A field near Forest Hill, Placer county, cleared of brush and planted produced a splendid crop the first year, but in the fourth year there was not enough soil remaining to raise a crop. This, of course, was on a steep sidehill. Everyone who has traversed the wagon roads of the Sierras show a remarkable amount of erosion. For long stretches on the North Bloomfield and Forest Hill Divides the roads are often natural cuts from 2 to 5 feet deep, often of several such cuts, parallel. A rough estimate shows over 7000 miles of roads in the area under discussion. Supposing these to have been excavated less than 1 foot deep—a moderate estimate, for the roads are often a series of parallel cuts—over 10,000,000 cubic yards of material has been removed. The Tenth and Eleventh Census Reports show that 4050 miles of mining and irrigation ditches have been built in the region and aside from the loosened dirt from their excavation great cuts, larger than many hydraulic pits may often be seen below some waste-gate or break. But all of these are minor affairs in comparison with the amount of augmented erosion caused by the loosening of the soil by cultivation and removal of the vegetation, and the instances are only given to emphasize the more important fact of which no certain data can be given. The material transported by natural forces is the fine sands and silts which reach the valleys and are much more effective in building up channel-bottoms and destroying farm lands than the larger proportion of coarse sands and gravel from the mines which seldom reach the plains.

The river Po with a drainage basin of 30,000 square miles discharges annually over 56,000,000 cubic yards of sediment and this river has so built up its channels as to make the surface of the water in places higher than the surrounding country from which it is restrained by dikes. This river has no hydraulic mining in its drainage. The Sacramento has a drainage area of less than 27,000 square miles, but comparisons must not be made as to these two streams, for their hydrograhic conditions are entirely different and the Po is only mentioned to show the enormous work of natural erosion. It is probable that the Sacramento could be shown to be doing even more work than the Po.

The geological history of the region has a bearing upon the debris question. The geology of the Sacramento, as often described by eminent geologists, is, in brief, as follows: The valleys of the Sacramento and San Joaquin were at one time a great inland sea. This sea received along its shores the sediments carried down by the streams from the Coast Range on the west and the Sierras on the east. In very recent geological time this basin was elevated so as to leave a great plain, sloping gently from each side toward the center. In this depression two great rivers were formed by the union of the formerly independent streams. These streams were torrential on account of their greater slope, and able to carry particles in mechanical suspension which the small grade and sluggish movements of the Sacramento of the present day cannot. These sediments were therefore deposited along the Sacramento—and the San Joaquin for that matter—and gradually the great depression was filled up. In times of high water the Sacramento spread over a wide flood plain and through this dead water flowed the swifter current of the main river; the current was able in itself to carry sediments that would deposit in the dead water. Along the contact between the still water and the current the moving water was checked and a line of sediment deposited, and thus a natural levee was built. This levee grew through many centuries until we have the Sacramento of to-day—a river between two belts of valuable farm lands, back of which on either side are swamps. Such phenomena are present along every river which flows through a flood plain.

The Sacramento has therefore built up its own channel long before the advent of men, and will continue to do so until some great change in topography shall change it altogether or until it reaches an exact base level—that is, until it is built up high enough to give it sufficient grade to carry off its sediments, as does the river Po. All of this is a slow process, but cultivation has greatly hastened it and the hydraulic miner has contributed his share, in a small proportion, as has been shown.

It may be said in passing that mining is responsible for this cultivation; it is also responsible for California's settlement, her transportation facilities, her towns, the value of her agricultural lands and her greatness.

Nearly as much debris is coming down the river to-day as during the days of hydraulic mining, for the natural erosion has been annually increased by increase in cultivation. The river has continued to devastate the farm lands since the closing of the mines in nearly as great a proportion as before, and will continue to do so.

In conclusion it may be said, then, that the Sacramento has been raising her channel and increasing the swamps for centuries, and will continue to do so. This devastation of the valley has been hastened by settlement and cultivation, and to a small proportion tion by the hydraulic miner.

*State Engineer Rept., 1880. Vol. III, p. 24. These amounts are based upon returns of the amounts of water used made by miners upon blanks sent out.

†Mendall, Report upon Mining Debris in California Rivers, 1882, p. 15. Based upon county assessors' returns of amount of water used.

‡Hydraulic Mining, p. 280.

Prince Hilkoff on Siberian Mines.

Prince Hilkoff, the Russian Minister of Ways and Communications, who lately passed through this country, gave some data to a representative of the New York *Herald* as to the Siberian Railway, and, speaking of the mineral resources, said:

"Recent investigations have shown how enormous are the riches in the bowels of this country and what little use has been made of them up to the present time. Iron and coal, the two great factors of industrial development, are found over nearly all Siberia and in very rich veins. The proper working of these riches will give a powerful advancement to the development of progress in Siberia. Mineral fuel also, which is of such great importance in working a railway line, has been discovered in such quantities in the formations that have been investigated that the Trans-Siberian Railway will be supplied for many years to come. In addition to this fact, however, wood is in many places so cheap that it can successfully compete with coal, especially in those parts of the route which are intersected by navigable rivers, along which the wood may be floated. The Siberian Railway will no doubt have a great influence upon gold mining. This industry heretofore has only prospered where very auriferous formations were worked. Many of them have been neglected only because the price of labor and machinery did not admit of their being worked with sufficient profit. In America, I believe, and in other countries where gold mining is carried on, much poorer beds are worked, and therefore the output is larger than in Siberia. The Siberian Railway will facilitate and cheapen the carriage of stores and implements to the gold mines, and also increase the supply of labor, from an insufficiency of which many of the mines are now suffering."

South Carolina's Mica.

The largest source of mica in the world is in South Carolina. Mica is found there in all sorts of blocks, of various thicknesses and shapes, which can be split and resplit almost without limit, until it becomes the transparent pane of commerce.

The material is scattered through the feldspar with which the surrounding mountains are mostly covered. The veins are found between walls of slate. It is blasted from the surrounding rock by means of dynamite, and is freed from all impure matter by miners with chisel and pick. From the mines it is taken directly to the shops, where it is split into thin sheets and trimmed into regular forms, which are then ready for the market, the price varying according to the size of the sheets.

The average size will fit an ordinary parlor heater. In rare instances sheets as large as 24x18 inches are found, but there is seldom or never a demand for mica of this size, so the sheets have to be cut down.

THE report of Leneve Foster, the mineralogist, brings England face to face with the fact of possible coal exhaustion. He says its supply will not stand a yearly increase of 3½ per cent in the output, and that signs of decline probably will become apparent within a lifetime. Prof. Jeven's estimate was that a century at the present rate of progress the output would exhaust English mines to a depth of 4000 feet, which is 1500 feet deeper than the present deepest mine.

The Solution and Precipitation of the Cyanide of Gold.*

NUMBER IV.

By S. B. CHRISTY, Professor of Mining and Metallurgy, University of California, Berkeley, Cal.

5. *On the Precipitation of Potassium Aurocyanides by Copper and its Compounds.*

It was early noted in the study of the cyanide process that copper, with its compounds, was destined to play a very important role in its development. In fact, it is well known that certain copper minerals are active obstacles to the successful extraction of gold from its ores.

The thought naturally suggested itself: May not this difficulty in the solution of gold be utilized to aid in its precipitation? In March, 1893, a sheet of metallic copper was immersed in a solution of cyanide of potassium containing a gramme of gold in solution. Instead of the precipitation of metallic gold on the copper, a light yellow precipitate began to form throughout the liquid. Very little of this formed on the copper itself; it was found as a sediment throughout the liquid. After three days three-fourths of the gold had been precipitated. The copper was then removed; but the gold-containing sediment continued to separate from the solution for over a week, until all but 11 mg. of the gold had been precipitated. This very important experiment did not at the time seem to lead to anything practicable, for the action seemed too slow and uncertain to be of any value.

Recalling the fact that the sulphide of copper had been suggested by C. H. Aaron and L. D. Godshall (*Eng. and Min. Jour.*, Nov. 29, 1890), for the precipitation of gold from the chloride solution produced in the Plattner chlorination process, it occurred to me that a similar precipitation might take place from the cyanide solution. Hence, on May 4, 1893, three lots of potassium aurocyanide, with 0.02 per cent of KCy and a quarter of a gramme of gold, were treated by agitation for four hours with CuS precipitated from $CuSO_4$ by H_2S. The still moist precipitate was washed and then stirred into the solution. One of the solutions was left neutral, the other made strongly alkaline with caustic potash, and the third made acid with sulphuric acid. In the alkaline and neutral solutions two-thirds of the gold were thrown down by the copper sulphide; in the acid one, all of it was precipitated. Numerous experiments with the sulphide of copper produced by fusion showed that the form originally used gave the best results, probably on account of its greater surface. Since the date of its first discovery, in May, 1893, this method of recovery of gold from cyanide solutions has been repeatedly used in my laboratory, and has stood the most rigid tests. It is necessary to acidify the solution with a mineral acid like sulphuric acid, and it is best to remove as far as possible the free HCy by one of the methods already explained. In case there is less than 0.1 per cent of free HCy present, this may be omitted. The CuS, Aq produced by the action of H_2S on a solution of $CuSO_4$ is then added to the solution; the whole is stirred thoroughly at intervals for several hours and then filtered out. The gold will be contained in the residue.

In one case, CuS, weighing, when dried, 5 grammes, was added to 1000 c.c. of an acidified solution of aurocyanhydric acid containing one gramme of gold in solution. All the gold was precipitated. The copper sulphide precipitated one-fifth of its dry weight of gold. The gold was readily recovered from the residue, after making it alkaline by digesting it with sodium sulphide, in which the gold is readily soluble. The copper sulphide may then be used over again. From the sulphide solution the gold is readily precipitated by electrolysis, the more readily as the solution is small in bulk and concentrated. Other methods of extracting the gold from the copper are also available.

The gold may also be removed from the cyanide solution, after acidification, by filtering it through CuS without agitation. I prefer, however, to agitate first and filter afterwards. Another method that was used was to add copper sulphate and then sulphydric acid to the acidified solution. Provided the excess of free HCy be first removed, one atom of copper will thus precipitate one atom of gold, or one pound of metallic copper as sulphate will precipitate 3.11 pounds of gold.

Both of these methods were used with complete success on the solutions obtained by treating gold ores with cyanide solution at various intervals from May, 1893, to 1896.

A careful study of the solutions used in the above experiments showed that the gold was precipitated without more than a trace of copper going into the solution. The unusual occurrence of one metal precipitating another without itself going into the solution, led to a careful study of the reaction involved. This was also viewed in the light of the experiment with the strip of metallic copper already mentioned. Also, in an experiment made in 1894, where Cu_2S was used to precipitate the gold from an acid solution of aurocyanide, a white precipitate, containing cuprous cyanide, was formed, which gave to the entire solution the appearance of milk. It was also noticed that when copper sulphate was added to a strong solution of of aurocyanide, a white precipitate formed which contained gold and copper. Also, when H_2S was added to a gold cyanide solution containing copper, it was noticed that, at the first instant when the gas came in contact with the solution, a white precipitate was formed, which gradually changed to the black color of copper sulphide as more H_2S was added. All these considerations pointed to the conclusion that the gold-containing precipitate was in all cases mainly a salt of aurocyanhydric acid, either cuprous aurocyanide or the corresponding sulphosalt.

This explanation of the reaction was made early in 1894. As soon as this was settled, another method suggested itself, and proved to be a success. A solution of cuprous chloride was prepared by adding sodium chloride to a solution of cupric sulphate and saturating the mixture with sulphurous acid. When this was added to the potassium aurocyanide, a white precipitate was formed at once, which contained all the gold. In the first experiment tried the metallic copper, present as cuprous chloride, precipitated over twice its weight of gold. All the cuprous salts were found effective for this purpose. Even the cuprous cyanide formed by adding copper sulphate to a potassium cyanide solution, and then acidifying with sulphuric acid and filtering out the white, curdy cuprous cyanide, was thus effective. As this salt is much more permanent than the cuprous chloride, it may prove of service in practice, though it is more expensive than the latter. I have also found that cuprous hyposulphite precipitates aurocyanides. The precipitate, however, is soluble in excess of either potassium cyanide or sodium hyposulphite. Hence a complete precipitation of the gold can only be expected after the solution has been made acid.

The method that I have used most constantly since April, 1895, is to add sulphuric acid to gold cyanide solution till it reacts acid to litmus. If the solution is strong in HCy, it is usually best to remove this first, either by the aeration method already described, or else to remove it, previous to the acidification, by means of the zinc sulphate method, to be mentioned later. To the acidified solution I add cuprous chloride, as above described. When this solution is added, the gold and excess of HCy come down at once as a white precipitate, generally turning slightly yellow. The cuprous chloride should be added till a drop of the filtrate gives a red precipitate with ferrocyanide of potassium. The gold is thus rendered insoluble, and may be filtered out as cuprous aurocyanide ($CuAuCy_2$). This compound is insoluble in dilute acids, but readily soluble in cyanide of potassium. The gold is easily extracted from it in several ways.

In October, 1895, Prof. P. de Wilde, of the University of Brussels, published a method of precipitating gold from cyanide solutions in the *Revue Universelle des Mines, de la Metallurgie, etc.*, in an article entitled "Note on a New Method for the Extraction of Gold from Tailings, Slimes and Concentrates."

His method consists in three steps:

a. The leaching of the ore, etc. This he does, as in the Siemens and Halske process, with an 0.05 per cent KCy solution, containing about the same amount of free caustic soda or lime, as may be necessary.

b. The recovery of the excess of alkaline cyanide. This he attempts, as had already been proposed by MacArthur, by adding ferrous sulphate and precipitating ferrous cyanide until potassium ferricyanide gives with a drop of the filtrate a precipitate of Prussian blue. In order to avoid the precipitation of the gold it is necessary that the free alkali should be nearly neutralized before adding the ferrous sulphate. This method will work, as I have proved by experiment, but I regard it as thoroughly unpractical. The bulk of the precipitate is something enormous; it takes a week to filter and remove the gold solution; the precipitate is constantly changing composition, running finally into Prussian blue; and it is no simple matter to extract the cyanide from it when once it has been obtained. The author himself evidently does not put much faith in it. He concludes by remarking that with dilute cyanide solutions this step of recovery may be omitted.

c. The precipitation of the gold. Here he describes a method the same in principle, and almost the same in detail, as the one I have described as used in my laboratory since April, 1895. I translate from his article:

"My third operation is based on the following principle: In a solution containing the double cyanide of gold and potassium ($AuKCy_2$) (or sodium) one precipitates all the cyanogen in the form of aurous cyanide (AuCy) and cuprous cyanide (CuCy), on acidifying first the solution with sulphurous acid (SO_3H_2) and then adding a solution of sulphate of copper (CuSO*).

"The reaction is extremely sharp, and the least excess of sulphate of copper suffices to produce an absolutely complete precipitation of the gold. In operating under the most varied conditions and with solutions containing only five or six milligrammes of gold to the 1000 c.c., I have never been able to find the least loss of gold.

"If the liquid contains alkaline cyanide in excess (which is the case in my method), this is transformed completely into cuprous cyanide.

"The acidification can be made by the injection of sulphurous anhydride (SO_2) by means of a solution of sulphurous acid, or of an alkaline bi-sulphite (metasulphite of potassium or of sodium $Na_2S_2O_5$)."

Nevada City District Geology.

NUMBER V.

In the Banner Hill district the veins are, as a rule, comparatively narrow. The ore is often rich and heavily charged with sulphurets, among which iron pyrites, arsenical pyrites, and zinc-blende are the most prominent. The sulphurets contain a considerable amount of silver. Along Deer creek, especially in the eastern part, there is a strong system of sheeting developed, cutting both the granodiorite and the sedimentary rock. The sheets or benches usually show a dip of 30° to 50° toward the north, and strike east and west. In the fissures dividing the sheets a narrow line showing iron pyrites and a bleaching of the country rock may be noted. Most of the quartz veins are parallel to this fissure system. The Omega, Neversweat, Belle Fountain, Lecompton, Montana, Willow Valley and Franklin are the most prominent of these mines. They are narrow veins, and have not been worked on a very extensive scale. The ore frequently runs above $100 per ton. The bullion contains much silver, and also, it is said, antimony. The developments on the Cyane, Constitution, and Levant are slight. The Federal Loan, which has been worked during the last few years down to the 600-foot level, dips south and is parallel to another and less developed system of sheeting. The ore from the Federal Loan is of a character similar to that of the mines mentioned. The vein varies from a few inches to several feet in thickness, and rich stringers are frequently abundant in the adjoining rock. There are about 6 per cent of sulphurets. The vein system at the Texas mine is parallel to that of the Willow Valley mines, but little work has been done to develop the property. The ore is said to contain 4 per cent of sulphurets and to yield $10 per ton. The Texas shaft was sunk to a depth of 160 feet ten years ago. The Deadwood is a flat vein dipping west. Its true direction is nearly north-south, though the topography gives its outcrop a nearly east-west direction. About $300,000 have been produced from this vein on which no work has been done for the last ten years. In ore and character it is similar to the other Willow Valley mines. The deposits of the Murchie mine consist of two veins with flat westerly dip, the Independence and the Lone Star, and the two east-west veins, the Big Blue and the Alice Belle; the principal work has been done on the first three. The veins are 2 to 3 feet thick; the ore contains 4 to 5 per cent of sulphurets and runs about $15 to the ton. The pay-shoots on the Big Blue are said to have followed the lines of intersection with the first two. The property was worked between 1878 and 1883, producing about $600,000.

Parallel to the Big Blue are the Caledonia and Kingsbury veins, the latter of which has been but slightly developed. The Caledonia has been opened to the level of Little Deer creek. It is said to be a wide ledge with low-grade, heavily sulphureted ore. The large St. Louis vein also belongs to this group, which shows the somewhat unusual east-northeast direction and steep northerly dip. It is an exceptionally straight and strong vein, which can be traced from the point where it emerges from under the andesite as far as McCormick's place, just over the map line in the Nevada City district. It is very wide in places, but the quartz is of low grade and has not been worked extensively at any place. The Charonnat or Canada Hill vein is faulted considerably by it. The Glencoe-Alaska, south of the St. Louis, is the continuation of the strong and well-defined Orleans vein in the Nevada City district. It runs about west 15° north, with steep southerly dip. It has been worked to a depth of 100 feet at the western end of the Glencoe claim, where the ledge is said to be 4 feet thick and heavily sulphureted. The ore is not of high grade. Between the strong vein of St. Louis and Glencoe lies a network of veins running in different directions. The most important is the Canada Hill-Mayflower group. An exceedingly well-defined sheeting of the granodiorite is noted near Canada Hill. There are several veins parallel to this sheeting and dipping west at slight angles. The Charonnat vein has been worked to a depth of 1300 feet on the incline. Between 1879 and 1887 it produced about $350,000, from ore worth $15 per ton and containing 2½ per cent sulphurets, with a value of $100 per ton. The Grant vein is parallel with the Charonnat, but dips to the east. Of the many veins in the Mayflower ground the Beckman is the most important. Its strike is east and west, and the dip is very flat southward. It is about a foot thick and the ore is very heavily sulphureted, containing, as do most veins in the vicinity, large quantities of arsenical pyrites and zinc-blende. A similar small flat vein, which has been worked at several places, is found to the west of this, on Sharp's and McCormick's ground. About North Banner an important group of veins occurs, which have in

general a northerly direction and an easterly dip of from 35° to 60°. Formerly the most important was the Banner vein, worked principally from 1865 to 1875, to a depth of 620 feet. It yielded several hundred thousand dollars. The ore was heavily sulphureted and averaged $20 per ton. The vein lies in hard, black slate, and evidently shows the same tendency as the Federal Loan to splinter up in stringers. The Banner vein does not continue north of the creek, or at least cannot be traced with certainty. On the North Banner ground there are four nearly parallel veins. These have recently been worked to some extent, producing from $30,000 to $50,000 for several successive years; the ore is not heavily sulphureted and contains a considerable amount of silver. To the west of the North Banner is the Union mine, on which the developments are slight. At 200 feet below the surface the vein cuts across the slate contact without change in direction or dip.

The quartz veins of the Nevada City district are as follows: The Orleans vein continues from the Banner Hill district across Gold Flat. In direction and dip this strong, continuous vein is parallel to the Idaho of Grass Valley. The developments are small, however, being chiefly confined to the old Orleans shaft, 200 feet deep, and the shaft at Fortuna mine. At the Gracie claim the vein is 1 to 2 feet thick. To the north of this vein there are many smaller veins, and still more to the south of it. The Sneath & Clay, in granodiorite, has a westerly, flat dip and is a comparatively narrow vein, but a pay shoot proved very rich in former years. It has been idle for the last few years. The Pittsburg, in diabase, has a north-northeast direction and an easterly dip. The vein averages 15 inches thick, and the quartz, whenever present, is of high grade. The sulphurets are not abundant, consisting chiefly of iron pyrites and galena. The Pittsburg has, at intervals, been an important producer. The shaft is 800 feet deep on the incline. The Gold Flat-Potosi vein lies a short dsitance westward. In character it is similar to the Pittsburg, and has been worked to a depth of 200 feet. Both veins are repeatedly faulted by several east-and-west fissures. Considerable work has been done in former years on the Thomas and Mohigan veins. The shaft on the former is 800 feet deep; the ore was heavily sulphureted and rich, but the ore bodies were very irregular.

The veins of the Providence-Gold Tunnel system are of the greatest interest and economic importance. They have in general a direction ranging from north-northwest to north-northeast and on the whole a very uniform easterly dip of from 35° to 45°. A peculiar radiating arrangement is clearly noticeable, all of the veins converging toward a point a short distance west of the Fortuna mine, but apparently dying out before reaching it. The easterly veins are in granodiorite, and begin with the Nevada county and Midnight (Stiles) veins, on both of which comparatively little work has been done. Westward lies the long Gold Tunnel vein, which has been worked at several places. At the Reward mine the vein is about 1 foot wide and has been worked to a depth of 200 feet. On the California ground the shaft is 600 feet deep on the incline, and in former years much good ore has been extracted. Northward the Gold Tunnel claim follows, with an inclined shaft 600 feet deep. The Gold Tunnel was a heavy producer for many years, but has been idle of late. It is known to have produced several hundred thousand dollars. At the northerly end of the vein is the Pennsylvania mine, with a shaft 500 feet deep. The vein is from 1½ to 2 feet wide, and the ore extracted averages $15 to $20, with 8 per cent of sulphurets.

The westerly veins of the Providence system begin with the Mountaineer, which for many years has been a heavy producer. The shaft is 850 feet on the incline. The average thickness of the vein is 1 foot, and the ore is often heavily sulphureted. The granodiorite adjoining the vein is usually very hard.

The Merrifield is probably the heaviest and longest vein in the district. It is first noted 3000 feet south of the Providence mine. Farther southward is the small vein of General Grant and El Capitan, which may possibly indicate a still more southerly extension of the Merrifield. At the Providence mine the vein leaves the slate and enters the granodiorite; it continues strong up to above the Spanish mine, with a slightly more westerly direction; above the Spanish mine the vein splits up somewhat, but there can hardly be any doubt that Mount Auburn represents its continuation northward. It is probably the same Merrifield vein that emerges from under the lava in the northwestern corner of the map area and continues down to the South Yuba river, near Hoyt's crossing. The developments to the north of the Spanish mine are slight. At the Spanish mine there is a shaft 300 feet deep on the incline. The vein is of variable width, averaging 3 feet, and in places heavily sulphureted. The next developments are at the old Merrifield mine and on the north side of Deer creek. South of Deer creek, in the Providence mine, the vein is most extensively developed by a shaft 1800 feet deep on the incline. The vein is characterized by heavy masses of quartz, up to 10 feet wide, and contains much sulphurets, there is also a considerable percentage of silver in the ore. The granodiorite on both sides of the vein is usually greatly broken and crushed and is traversed by numerous seams parallel to the vein. Sometimes the crushing has gone so far that the rock is converted to a schistose, chloritic mass. In certain places there are two or more veins, separated by zones of crushed granodiorite, the whole mass "between walls" attaining 30 feet in width. To the south of the Providence mine, beyond the point where the vein enters slate, the old underground works not accessible now, showed the vein to follow the contact for about 800 feet on the incline, as shown on the structure-section sheet. All this indicates beyond doubt that the force producing the Merrifield fissure was of unusual strength and that the resulting movement was considerable. From the relations mentioned it is believed that the movement along the dip of the vein must have been about 800 feet, and the fault is clearly an overthrust in which the hanging wall has moved up relatively to the foot wall.

(To be Continued.)

Gold Mining in Mexico.

The student of mineral statistics can scarcely fail to be struck with the recent increase in Mexican gold output. In 1893 the value of the gold produced was only about 3½ per cent of that of the silver. In 1894 it rose to about 14 per cent; in the next year the product increased from 14,896 pounds to 18,539 pounds fine gold. This year the figure is likely to be higher. The change is not to be attributed to a diversion of mining enterprise, created by any decline in the silver industry. For years Mexico has held the second position as a silver producer, but last year it rose to the first rank, with a reported output of 3,482,382 pounds, exceeding that of any other nation in the world. Nor is it that the country lacks other outlets for the employment of mining capital. Mexico possesses immense iron deposits; and, although the Boleo mines in Lower California continue to be the chief source, there are elsewhere a number of very promising copper lodes. Quicksilver mining is on the increase, and some new discoveries of cinnabar have been reported; tin and antimony exist. Lead, however, is won chiefly, if not entirely, in connection with silver, and mines of soft or non-argentiferous lead are so far scarce. But the most important mining work now in progress at several points is the exploitation of the coal deposits. It is in this industry, in the development of road and rail communication, and in the improvement in the mining code, with the reduction to taxes, that the enquirer finds a reason for the recent increase of the gold output. With cheaper fuel, the possibility of transporting heavier machinery to the mines, and improved methods of water storage, many auriferous properties that in the past did not pay are now being worked at a profit, and the industry in general is becoming a commercial success.

From a geological and mineralogical standpoint, the Mexican tableland, resting on a foundation of granite, seems to consist mainly of metamorphic formations, partly upheaved, and overlaid by igneous masses of all ages, chiefly represented by shales, greywacke, greenstones, siliceous schists, and unfossiliferous limestones. All these formations are alike remarkable for the abundance and variety of their metalliferous ores, as silver, silver-glance, gold and copper. The most valuable rocks are the argentiferous porphyries and schists in the central plateau and in Sinaloa, together with the auriferous deposits of Sonora, the extreme northwestern State. Some gold mines in this latter district have lately come under the writer's notice, and the information that he is here able to give may perhaps convey a rough idea of gold mining in this State, and serve as a comparison for similar enterprises in other parts of Mexico. The main auriferous vein system of Sonora runs north-northwest to south-southeast. The outcrops are often scanty. The lodes, which occur as contact deposits, also as independent veins traversing the country rock, vary greatly in width, in places being as narrow as 1 foot and again swelling to upwards of 100 feet. As usual, the ore bodies that are largest and most productive are often found as shoots or chimneys near the junction of a tributary with a main vein. But rich ore is also encountered in detached bodies or bonanzas of irregular shape and greater or less size, their origin being doubtless due to the number of feeders that cross or converge with the main veins at varying angles. The gold, for the most part, is not free milling, but is associated with silver, and debased by varying amounts of pyrites, copper and galena, the percentage of sulphides being ¼ per cent, occasionally rising to 12 per cent. In gold contents the ore is not high grade. In one of the properties referred to the assay value was 14 dwts. 16.3 grains per ton; in another group of mines the mean of seven samples was in refined or parted gold 15 dwts., equivalent to £3 3s. 8d., and in silver £1 5s. per ton. The usual method of treating the mineral is to hand pick, and send the high grade with the concentrates from the vanners, to the smelter. The medium ore is stamp crushed, amalgamated by the Boss system in pans and settlers, with concentration on Frue vanners. The low grade material is passed through breakers and rolls, screened, concentrated on jigs, and amalgamated on copper plates. The total extraction is about 80 per cent of the gold and 66⅔ per cent of the silver. In the case of the mines last referred to, the total cost of treatment appears to have been 41s. to 43s. per ton, of which mining was responsible for 16s. 8d. per ton. At present a large proportion of the fuel used in Sonora is wood. Under the Mexican laws the owner of a ranch is permitted to cut down on it all the wood he requires. To acquire an interest in a ranch is, therefore, the cheapest way of obtaining fuel. Palo fierro (iron wood), weighing 80 lbs., and mesquite, weighing 54 lbs. to the cubic foot, are excellent firewood, and average, with delivery within reasonable distance, about 13s. to 14s. per cord. Mining timber is brought by sea to Guaymas, in the Gulf of California. Ocean freights from Europe to Guaymas vary slightly with the season, but are always low. From Guaymas a railway traverses Sonora to Nogales on the northern frontier, and thence communicates with the lines of the United States. Some of the country roads are passable by carts drawn by mules, but arroyas or dry watercourses are frequently troublesome obstacles for carts, and a very large number of the tracks are open only to mules. Carts carrying, say, two tons cost about 6d. per ton-mile; mules, taking 300 lbs. per animal, cost perhaps 1s. per ton-mile. Machinery, etc., is sometimes slung, and carried by Indians. Native labor is fairly cheap, miners earning about 3s. to 4s. per day, laborers from 2s. to 3s., engineers from 8s. to 10s., carpenters and blacksmiths 5s. to 6s. High-class mechanics, blacksmiths, carpenters, millmen, etc., have to be brought from the United States, and paid accordingly. There are, as might be expected, considerable water difficulties in Sonora, in most cases to be overcome only by pumping, well sinking, and storage. In the three months of the wet season, the rainfall, never very heavy, is sometimes extremely scanty. The river system, running roughly north and south, comprises the Rio Magdalena, flowing by Altar; the Rio Sonora, pass-Hermosillo; the Rio S. Miguel, a tributary of the Sonora; the Rio Matape, entering the sea slightly south of Guaymas, and the Rios Yaqui, Mayo and Fuerte. The laws regarding water rights, acquirable by the purchase of river-side property, are complicated; and the amount of water that can by this means be obtained is limited. The present main groups of Sonora mines are situated in the vicinity of Sta. Ana and of Hermosillo, both of which towns are on the line of rail. The writer understands that within the last few months two French companies have acquired gold mining properties in the San Pedro range of Sonora, and that another company is in contemplation. It is also said that numerous American prospectors are busily at work taking up known mines and seeking for new ones, with a view to presently exploiting auriferous Mexico.—Capt. C. C. Longridge, in the London Mining Journal.

Edison on Diamond Making.

Thomas Edison, in an interview with a representative of the New York *Herald*, lately claimed to have anticipated Prof. Moissan in the manufacture of diamonds. He said: "I succeeded in producing infinitesimally small diamonds—diamond dust, in short. That these were true diamond crystals I ascertained by sweeping them upon a bit of leather, when I found they would cut into a sapphire. I see that Prof. Moissan has succeeded in making rather larger ones. But all these experiments were with me simply a scientific pastime. The production of gold and of diamonds would be of no practical value to the world unless, indeed, the diamonds were black; then I'd jump at them like trout to bait. No white diamonds for me, but niggers; the blacker, the harder, and the uglier the better. That would be worth while. Black diamonds are of enormous practical value. If we could get enough of them at low enough prices, we could cut canals right through miles of solid granite. But white diamonds would be of no use to me. And if the time ever comes when white diamonds can be produced by shovelfuls in a chemical furnace, they couldn't be of any use to anybody. Not all the lawmakers in the United States or in the world could make them worth more than 50 cents a peck. And it's the same with gold. I believe it is not only a possibility, but a probability of the future, that we will discover a process of transmutating the baser metals into gold."

THIS is the first time that the notorious "house organ," by which is meant the trade journal ostensibly conducted on its merits, but actually operated by a mercantile or manufacturing concern which uses it to advertise and push the sale of its goods—this is the first time, so far as we can recollect, that it has risen to the importance of being mentioned in a President's message. It is an extremely rotten and corrupt institution and is unworthy to be classed as a periodical. However, it masquerades thus in order to be admitted to the mails at 1 cent a pound. Without this sustaining privilege it could not be run at all, except at serious loss. The names of these house organs are legion.

Scientific Progress.

Aluminum Manufacture.

The product of aluminum in the United States increased from 550,000 pounds in 1894 to 920,000 pounds in 1896. In 1854, when the first works for its manufacture were started, the price of aluminum was from $2 to $4 per ounce. In 1882 this had fallen to $12 to $14 per pound, and in 1891 the price was about $1.70 and in 1893 from 55 to 66 cents per pound.

Alfred E. Hunt, in the report of the United States Geological Survey, just published, on "The Mineral Resources of the United States," speaking of its manufacture in Europe, says: So far in the development of the metallurgy of aluminum, France, England, Germany, Switzerland and the United States have been the only countries of the world dividing the honors. In the future the countries having good water powers will undoubtedly compete for the world's trade; and already the Aluminum-Industrie-Actien-Gesellschaft have secured, in addition to another power on the Rhine near Basle, Switzerland, a water power in Austria for a future development of works. In Russia there are several large landed interests with water powers, the advantages of which they are considering for the manufacture of aluminum. In Norway and Sweden there are also good water powers which the new developments in electro-metallurgy are bringing into favorable consideration. A plant in Norway, at Sarpsfos, has been definitely decided upon; this plant having a capacity of 10,000 horse power steadily during the entire year, the fall of the water which it is proposed to utilize being about 80 feet.

The disadvantages of most of the European water powers that would seem to be in other ways available are their periods of low water in the winter and early spring season, when the snows of the mountain glaciers which feed their headwaters, where water powers are situated, are frozen up. Owing to the comparative slowness of operation of the present successful electrolytic process of manufacture of aluminum, continuity of operation seems to be an almost necessary prerequisite to economical manufacture.

As to the methods of manufacture, all the aluminum now being made in the world is practically made by the general process of the electrolytic decomposition of alumina dissolved in a molten flux consisting of the fluoride of aluminum together with the fluoride of a metal or metals more electro-positive than aluminum, the idea being to use a flux which dissolves the ore with the most facility, remains molten the longest, is least subject to decomposition, allows the best circulation around the anodes, and is the easiest to manage continuously without caking up.

Bauxite has become recognized as the best native ore of aluminum, and as the purification of its contained alumina from silica, oxide of iron and titanic acid has shown that the silica is the *bete noir* of the operation, the location of bauxite rich in alumina and at the same time low in contained silica is an important factor to the manufacturer of aluminum.

THE idea that compressed air mixed with steam in the cylinder of a steam engine would be productive of economy has been endorsed in times past by engineers of eminence. Some ground for this belief exists in the known fact that the presence of the air in the steam decreases the amount of cylinder condensation. To find the exact effect of such a mixture upon the economy of an engine tests were recently undertaken at Stevens Institute, the engine used for the purpose having a single cylinder $7\frac{5}{32}$ inches in diameter and 14 inches stroke, running from 200 to 228 revolutions per minute and cutting off at one-quarter of the stroke. The tests were in four series, as follows: First, tests 1 and 1A, using steam alone; second, tests 2, 2A, 3 and 4, using air and steam, the air at a temperature of 70°; third, tests 5, 6 and 7, using steam and air, the air being heated to about 540° Fahr., corresponding to the temperature of adiabatic compression; fourth, tests 8 and 9, under the same conditions as 5, 6 and 7, except that the air orifice was enlarged to twice its original diameter. The steam pressure averaged about 90 pounds. In series 2 and 3 the air entered the steam pipe through a hole $\frac{1}{10}$" in diameter, and in series 4 the orifice was $\frac{1}{8}$ of an inch. The air admitted varied from $1\frac{1}{2}$ per cent (by weight) of the steam to $8\frac{1}{2}$ per cent. The indicated H. P. averaged about 20. The water per indicated H. P., without air, averaged 32 pounds. When air was used it averaged 30.7 pounds. The best results gave a saving of about 7 per cent, but this is almost exactly offset by the power required to compress the air, so that the saving per net H. P. is nil.

Transmission of Earthquake Motion.

In a recent lecture delivered by Professor John Milne, formerly of the Imperial University, Tokio, to the members of the Edinburgh Philosophical Institution, on "Earthquakes and Volcanic Disturbances," the author stated that the chief feature of the lecture was the announcement of the fact that an earthquake occurring in any portion of the earth could be recorded in any other part by means of suitable instruments. He showed diagrams of earthquakes recorded in England which had originated in Japan. The motion came from Japan to England in sixteen minutes, and therefore in all probability traveled through the earth rather than around its surface. This high velocity with which motion was propagated indicated that the earth had a higher rigidity than had hitherto been supposed; in fact, the globe transmitted motion more quickly than a ball of glass and steel. In order to learn more about the nature of the interior of the earth, he suggested that there should be placed on its surface at intervals of from 1000 to 2000 miles instruments for picking up the unfelt earthquake motion. The cost of these installations would be about $250 each, and twenty of them would be sufficient. With such an equipment we might learn more about the nature of the earth on which we live in a period of three years than we should by a hundred years of speculation.

PROFESSOR FRANK CLOWES recently delivered a lecture on the explosibility of acetylene, remarking that the value of acetylene as an illuminant and the discovery of its ready production from calcium carbide have led to the manufacture of this gas in some quantity, and acetylene will probably be dealt with in still larger volume in the near future. It becomes, therefore, important to devise methods for detecting its presence in the air, arising from leakage and escape, and to measure the percentage of the gas present at any place. It is also important to know what proportions of the gas, when present in mixture with air, will lead to explosion if the mixture should be kindled. The detection of small proportions of the gas will not be readily effected by its smell when it is prepared in a state of purity. At present the smell is made more pronounced by the impurities which the commercial gas contains. Further, the smell will not in any case furnish a means of measuring the proportion present in the air.

THE most powerful lighthouse in the world is now being built at Penmark point, in the Department of Finistere, France. The height of the tower is about 200 feet, which will enable it to be seen during the day from a distance of eighty miles in fine weather. The rotundity of the globe will prevent the rays from striking the eye directly at a distance of more than forty miles, but the sky overhead will be illuminated for forty miles more. The great illuminating power of the light is provided by a similar apparatus to that first used in France in 1829, at the Heve lighthouse. The principle is based on the fact that a flash of lightning lasting no more than one-tenth of a second suffices to produce on the retina its complete effect. The new lighthouse will send flashes of concentrated light over the ocean every five seconds, each flash lasting one-tenth of a second.

Mechanical Progress.

A Novel Method of Mining.

It has been known for many years that a deposit of sulphur existed in Louisiana, and several companies have endeavored, but failed, to make its extraction profitable. This deposit is at a depth of 300 or 400 feet, and is immediately overlaid by 160 feet of quicksand. One company tried to freeze the sand so as to sink a shaft through it, but did not succeed. It is now reported that a method has been devised for mining the sulphur which promises success. It consists in melting the sulphur and forcing it to the surface in a liquid state. Both the melting and the forcing upward are accomplished by the same agent, which is water heated, under pressure, to 335° Fahr. A hole is first drilled to the sulphur deposit large enough to receive a 6-inch pipe. Down the center of this pipe passes a 2-inch pipe; this smaller pipe has a series of holes opening into the larger pipe just at the bottom. A 4-inch pipe passes between these two but does not extend quite so far down. The annular space between the two outer pipes is closed by a stout partition at the lower end of the 4-inch pipe. Above this partition a series of holes is made through the walls of the outer pipe, and a similar belt of holes is also made at its bottom. Water heated to 335° Fahr. is forced through the space between the two outer pipes, and when it reaches the partition at the bottom of the inner one of these two it passes out at the upper holes and melts the sulphur surrounding the pipes. This melted sulphur is driven in at the lower holes and forced up, in the space between the two inner pipes, to the top of the well. To prevent the solidification of the sulphur on the way up, hot air is driven down through the inner pipe. The air passes out of the inner pipe at its bottom and ascends upward through the same channel as the sulphur. The pipes are sunk deeper into the bed of sulphur as occasion requires. The pipes are made of steel coated with aluminum. The sulphur flows from the well in a liquid state and is run into shallow vats to cool. It is then cut into blocks convenient for shipping. Much of the deposit is said to be very pure, reaching as high as 99 per cent of clear sulphur.—A. E. Tillman, in Cosmopolitan.

Effect of Concussion on Cast Iron.

In a paper before one of the Philadelphia technical societies A. E. Outerbridge Jr., chemist, expressed his dissent from the common theory that cast iron becomes brittle under repeated shocks. He was led to test the matter by noticing that a number of bars of cast iron, 1 inch square and 15 inches long, gained strength by being shaken for several hours in a box to clean them from sand, and, to test the matter still further, he prepared twelve more bars, six of which were tumbled in such a box for four hours, and these showed a strength 10 to 15 per cent greater than the six not thus treated. Experiments were then made by subjecting six to 3000 taps on one end with a hammer, the result being a gain in strength about equal to that exhibited by the bars in the box. The tapping produces what Mr. Outerbridge calls molecular annealing, which differs from annealing by heat in that it has no power to change the condition of carbon in the castings, or alter the chemical constitution in any way.

THE Bridal Veil Lumbering Co., in Oregon, not far from The Dalles, has a railroad upon which cars are not used. A train upon the road consists of an ordinary locomotive, such as are common on logging roads, and a string of logs, each log being as large in diameter as the boiler of the engine, or larger. Boards are nailed to the sleepers between the rails, and on these the logs slide. Except on descending grades, the boards are greased, and the train moves at good speed. Where the road is level or slightly ascending, the engine pulls the logs, and where it is descending it holds them back. At the mills of this company the manufactured lumber, regardless of size, is run into a flume, and this is carried about two miles to the planing mill and shipping yard, the flume descending in that distance about 1200 feet.

War Locomotives.

Armored locomotives and armored railroad trains for war service have been in evidence, more or less, for twenty years, if not longer, and England, in one of her early Egyptian campaigns, found them effective equipments for offensive as well as defensive operations in the enemy's country. Since that time such engines and trains have been under experiment and in actual service with various degrees of success, with every indication pointing to the probability of their becoming increasingly important factors in modern warfare. Sand bags, which were among the earliest armor used in this comparatively novel branch of military engineering, have been replaced by iron and steel, and the war locomotive of to-day is a decidedly more business-like structure than its makeshift predecessor. It is well represented in its latest form by two locomotives recently built for the Spanish. Both engines have cabs of heavy steel plate, capable of resisting rifle balls, and the windows and doors are fitted with steel shutters, having loopholes through which the guards can operate rifles or the machine gun which is to be mounted in the cab.—Cassier's Magazine.

FOR Michigan, a unique engineering feat is being accomplished in Iron county, over the Hemlock mine. Recently miners at work in a tunnel of the mine that extends under the bed of the Hemlock river were alarmed at seeing water dripping down from overhead. They refused to work in the tunnel any longer, and it soon became spread about that the Hemlock was liable to cave in at any time and let the river above rush in and drown the workmen. To prevent such a disaster a large dam is being constructed on the Hemlock river some distance above the point under which the mine tunnel runs. This will hold back the water and the workmen there are building a sluice—away from the dam over the mine shaft and some distance below it. The sluice will rest on two immense arches that will in turn be built up from the bed of the Hemlock river. It will be made of matchwood lumber and will not leak. After it is finished the water from the dam will be freed and will course over the sluiceway and the river bed below will be dry.

IT hardly seems as though an engineer who is up to date should persist in using one kind of oil throughout the mill, oiling light and heavy shafting, machinery, and high and low speed bearings and engines and gears with the same kind of oil, but this practice is followed by some concerns. It is not a good practice; it does not pay. No young engineer who has studied the matter fully will do so, unless he is obliged to do it by positive orders from the office. Sometimes these orders take the form of the lack of more than one kind of oil. Study the peculiarities of all kinds of oil. Note also the peculiarities of your machinery, and decide which kind of oil gives the best results therewith. Then, that point once determined, insist upon having the required brand of oil for each kind of work until some better kind is placed within your reach.

Electrical Progress.

THE principle of cataphoresis, or the driving of foreign substances into animal tissue by means of electric currents, has been adopted with great success in both medical and dental work. In these capacities it is employed principally in conjunction with cocaine, or some other anæsthetic, for the purpose of rendering the flesh or the tooth to be operated upon insensible to pain. The benumbing solution is forced into the tissue, and even into the obdurate sensitive dentine of the tooth, until no sensation whatever is possible for the time being in the region under treatment. A provision merchant of Rio Janeiro has hit upon the ingenious idea of applying this method to the preservation of meat. He immerses the meat to be preserved in a 30 per cent solution of common salt and passes through the whole a continuous current of electricity. In from ten to twenty hours the salting is said to be complete, and the meat is taken out of the bath and hung up to dry. For the guidance of those who might be disposed to try the method, it may be added that in working a bath of 3000 litres of brine in which 1000 kilos of meat may be immersed, the current may be of 100 amperes, with an electromotive force of eight volts. The electrodes must be of platinum, since, if other metals, such as zinc or iron, were used, the metal salts formed would be injurious.

DR. C. E. EMERY, before the American Institute of Electrical Engineers, said that the high-speed electric locomotive of the future will, like the steam locomotive, be a structure independent of the train; the motors will be hung on the frame independent of the driving wheels, and the same as well as the driving wheels connected by side rods. To obtain proper room under such conditions larger driving wheels will be employed than the wheels of an ordinary car. This will so extend the wheel base that it will not be safe to run at high speeds without the leading truck, the same as on an ordinary locomotive, and in fact the electric locomotive will in all its general features be a steam locomotive without the boiler, with motors substituted for the steam cylinders. In this way, and probably in no other, can the flexibility of the present steam locomotive be obtained.

THE four largest dynamos yet built are now being placed in the Allegheny County Light Company's plant, Pittsburg. Each is 30 feet long, 24 feet high and 4 feet wide. The armatures alone are 16 feet 8 inches in diameter, and each weighs more than thirty tons. Each is directly mounted on the shaft of a 2000 horse power Westinghouse double acting compound, marine type. The shafts are 18 inches in diameter, and where they pass through the bearings they are 13 inches in diameter. These bearings are 3 feet long. These four machines will each produce 20,000 incandescent lights and 2500 arc lights. These great machines made an enlargement of the building necessary, and a new structure was erected over the old one.

THE great opening in the present state of the electrical industry is for design rather than new invention. The man who can design machinery in such a way as to save 5 per cent in the cost of materials or labor is always valuable. He must be versed in detail, and capable of readily grasping the commercial details of the subject. The question of commercial efficiency also comes largely into the design, and the manufacturers who can maintain the reputation of their apparatus for smooth working and durability are sure to succeed. Hence, says the *Electrical Engineer*, while striking departures from existing practice may bring success to one man, two others will make fortunes by being able to get the best results at the least cost from every-day types.

IT is reported from Calumet, Mich., that the Calumet & Hecla Company will soon sink three new shafts on its part of the amygdaloid vein, which a drift, three years ago, showed to be about as rich in copper ore as the same vein in the Osceola mine. These new shafts, with the new Red Jacket shaft, will, it is said, increase the product to 130,000,000 pounds of copper a year.

Practical Information.

Making a Half-Tone.

How such engravings as that of the sawmill, run wholly by electricity, on this page and also on the first page of this issue, are produced, is sometimes the subject of inquiry. In the first place, a glass screen with diamond-scratched lines, ruled at right angles so closely together that the spaces can hardly be distinguished, is placed one-eighth of an inch in front of the sensitive plate in the photographic camera. Looked through, the effect is much the same as gazing through a sieve. These lines reappear in the half-tone engraving when printed.

The photograph, or wash drawing, from which the photo-engraving is taken, is photographed in the usual way and with the usual sensitive plate, with the previously described screen in the camera between the plate and the picture. This produces a negative of the picture, showing the fine cross lines represented by clear glass. Now, in order to have the same position of the object in the engraving as in the original, the film of the negative is treated to one or two coats of collodion, which gives it a sufficient consistency to permit of its being removed. This film is transposed to the opposite side of another glass. After careful mounting, this new negative is ready to be used as a medium for printing on the zinc plate.

The face of the plate is buffed to the highest degree of polish, then coated with a solution of albumen and gelatine, then sensitized with bichromate of ammonia. It is then dried and placed in the printing frame, the coated side next to the negative film. The case is then exposed to the sun or light three to five minutes, or to an electric light for fifteen to twenty minutes. The light passes through the heavy inch-thick glass of the printing frame, then through the negative, striking the sensitized plate, and decomposing the chemicals wherever it may fall.

Where the plate is protected by the shadows and half-tones of the negative the sunlight has less effect, and where the shadows are dense it has no effect. This plate is then removed from the frame in a dark room and carefully washed in running water for several minutes, then dried and heated until the picture appears of a dark-brown color. The back of the plate is rubbed with wax while hot, to protect it from the etching solution, which is made from perchloride of iron.

The picture on the plate is acid proof and the etching solution eats only where the plate is unprotected—that part which is blank in the finished engraving. The plate is allowed to remain in the acid bath for about fifteen minutes, or until sufficient depth is obtained. It is then washed and is ready for the router and the printer.

A CORRESPONDENT of the *Practical Engineer* describes a novel method of removing boiler scale, as follows: "I have used turpentine on the scale with a sponge in the dark for fifteen minutes, then got out and applied a light, placed on the end of a 12-foot bar, keeping myself well out of the boiler for safety. I have done a day's work in half an hour. The instant heat of the turpentine shatters the scale immediately." That sounds all right, but is not cordially recommended.

UNITED STATES CONSUL NORRIS, at Ghent, has reported an interesting fact to the State Department regarding the manufacture of incandescent lamps. It is that the most expensive product in the world is the charcoal thread employed in the lamps to furnish the light. This will be interesting news to the people who use electric light nightly without being cognizant of such proximity of wealth. It is, for the most part, manufactured at Paris and comes from the hands of an artist. This product is sold at wholesale by the gramme, and, reducing this price to the basis of pounds, it is easily found that the filaments for lamps of 20-candle power are worth $8000 per pound, and for the lamps of 30-candle power the fabulous sum of $12,000 per pound. The former have a diameter of twenty-thousandths of one millimeter, and the latter less than one-fifth of this size.

THE FOLSOM ELECTRIC SAWMILL. (*See page 25.*)

Coast Industrial Notes.

—C. A. Martin of Reno, Nev., shipped twelve carloads of cattle to Oakland, Cal., this week.

—The contractors on the Astoria-Globe railroad in Oregon have 300 men at work and will soon increase the number to 500.

—Governor Sadler of Nevada recently sold 1500 head of stock cattle at $18 per head to McCormick Brothers of Stockton, Cal.

—Building the Salinas, Cal., beet sugar factory has begun. It comprises a quadruple mill, four sets of diffusions, each 250 tons daily capacity.

—The S. P. R. R. Company is going to build a rock-crushing plant at Truckee, Cal. It will be run by electricity and the crushed rock will be used to ballast the road-bed through the snowsheds.

—The largest oak wine vat in the world has been set up by the California Wine Association at the Lachmann cellars on Brannan street, San Francisco. The Heidelberg cask has a capacity of 50,000 gallons; the San Francisco one holds 80,000 gallons.

—The Suisun, Cal., bonds of $42,000 for a new water system have been sold. Work will commence next month. Water will be brought a distance of eight and two-thirds miles to town, the source of supply is reported capable of a daily flow of 300,000 gallons.

—The tunnel through the Cascade mountains in Washington for the Great Northern Railway will be 2.49 miles long from Tunnel City, the west portal being at Wellington. It will be about 15 feet wide, 23 feet high, and lined with brick or stone where necessary. The estimated cost is $2,000,000.

—Cotton is now being carried through San Francisco across the Pacific to Japan, there made into cloth and reshipped here for sale. The old Pioneer Woolen Mills of this city, recently dismantled and carried to Japan, are now turning out woolen goods that come into competition with California manufactures.

—On the 31st ult. H. T. Scott of the Union Iron Works and Minister Hoshi of Japan signed a contract for the former to build for the Japanese government a steel cruiser of 4760 tons burthen, to cost about $1,500,000 and to be completed and delivered December 31, 1898. An illustrated description of this cruiser appeared on page 397 of the issue of November 14, '96.

—The Los Angeles *Times* says the oil industry of southern California is full of promise. Important development is being made in the Los Angeles oil field, and flattering reports are coming in from Whittier and Fresno. From present indications, oil of the lightest gravity may reasonably be expected from one or more of the southern California strata. The market is quiet. Prices are ranging from 90 cents to $1 per barrel at the well tanks in the local field.

—The Mexican Government is about to improve the harbors on the west coast. Arrangements have been made to raise a considerable sum for this work, in addition to the $5,000,000, for the improvement of Coatzacoalcos and Salina Cruz, the eastern and western termini of the Tehauntepec road. In accordance with the Government's plans an engineer, Arthur F. Wrotnowski, has been sent to the western coast to inspect all of the harbors and determine which shall be improved and to what extent.

—The Utah & California Railway Company has been organized for some time to build a road from Milford, Nev., to Los Angeles as soon as the Oregon Short Line shall have been segregated from the Union Pacific. The Oregon Short Line runs from Salt Lake City to Milford. The road between Milford and Los Angeles will run through coal and lead ore districts in southwestern Utah. Right of way is said to have been secured by Oregon Short Line people for most of the distance between Milford and Los Angeles, which is about 400 miles. Work will be begun immediately after the separation of the Short Line from the Union Pacific.

—In 1886, 1928 tons of anthracite coal were imported at San Francisco; the importations increased every year; in 1895 they amounted to 50,930 tons, for the first eleven months of 1896 they amounted to 81,255 tons. From 1862 to 1864 the duty on anthracite coal was 60c a ton; from 1864 to 1870 it was 40c, and since then it has been on the free list, for the reason that the quantity of anthracite coal produced outside the United States was, prior to 1870, so infinitesimal that it was considered an absurdity to retain it on the dutiable list. Since then extensive fields of anthracite have been discovered near Swansea, Wales, from which the California importations come.

—Among California products for the year 1896 were: Gold, $16,160,613.44; borax, $800,000; petroleum and bitumen over $1,000,000; salt, $130,000; mineral waters, $400,000; natural gas, $150,000; quicksilver, 30,743 flasks worth $36.50 per flask; beet sugar, 46,000,000 pounds; wheat, 28,682,200 bushels; brandy, distilled from grapes, nearly 1,000,000 gallons; barley, 10,800,000 bushels; beans, 68,000,000 pounds; raisins, 84,000,000 pounds; dried fruit, 148,500,000 pounds; dried prunes, 51,000,000 pounds; canned fruits, 1,000,340 cases; wool, 24,500,000 pounds; hops, 52,000 bales; oranges, 1896-7, estimated, 8375 carloads; 1896, 2,512,500 boxes; butter, annual product, 48,000,000 pounds; cheese, 16,000,000 pounds; wine, receipts at San Francisco, 12,914,670 gallons; brandy, 163,650 gallons; provisions, $5,500,000; value of nuts, $350,000; powder, 12,000,000 pounds. The total gold product since 1848, is figured at $1,368,429,278; quicksilver since 1877, 810,767 flasks; gold and silver since 1848 $1,475,434,107. Seventy-six thousand acres were set to orange trees and 70,000 to prunes. There are 3,900,000 acres of land under irrigation. There are 340,000 milch cows in the State and $10,600,000 invested in dairies.

Personal.

A. N. BUTTS of Angels Camp, Cal., has been at Mercur, Utah.

MARCUS DALY is going this month to Mexico to look up some mining property he is interested in.

CHRIS MALLON succeeds A. F. Kipper as superintendent of the Brunswick mine, Grass Valley, Cal.

EDMUND DE STOUTZ, who has been in charge of mines near the Rio Tinto, in Spain, has been appointed superintendent of the Continental copper mines at Globe, A. T.

LATEST cable advices to this journal from Russell L. Dunn, who went to Siberia last July for a French mining syndicate, indicate that he will shortly return to Paris.

EMILE M. DU MARIAS, a mining engineer, and Emile P. Enders, editor of the *Revue Economique et Financiere* of Paris, representing French interests, are visiting Utah mining districts.

JAS. A. POLLOCK, of Salt Lake City, Utah, the most prominent mining stock broker of that section, who has been visiting his mining property in Tuolumne Co., is in this city to select some improved mining machinery.

V. M. CLEMENT has returned from South Africa and last week was in Utah, where he joined Charles Butters. In 1888 Mr. Clement was at the Bunker Hill and Sullivan mines in Idaho, and later joined John Hays Hammond in South Africa.

MR. P. GEORGE GOW has resigned the local management of the Gold and Silver Extraction Company of America, Limited, and will in future devote his attention to his mining business, he being manager and part owner of the Jumper and New Era mining property. Mr. Bertram Hunt succeeds him as local manager of the cyanide company's business.

Recent California Mining Incorporations.

Norwegian Mining Company, San Francisco; capital stock, $1,000,000—$250 subscribed; W. C. and R. S. Murdoch, H. F. Emeric, T. W. Wells, F. Enzensperger.

Holiday G. M. Company, San Francisco; capital stock, $1,000,000—all subscribed; G. W. Baker, T. J. Parsons, W. A. Jacobs, J. A. Stephens, S. K. Thornton, R. B. Harper, G. T. Davidson.

Tryon G. M. Co., San Francisco; capital stock, $2,500,000—$2,000,000 subscribed; C. W. Tryon, W. B. Lee, J. S. Drake, G. C. Tryon, H. H. Lee.

Gerrymander G. M. & M. Co., San Francisco; J. S. Joseph, Sonora; B. Joseph, E. Epstein, J. J. Schultz, M. F. Lowenstein, J. D. Abrams, W. H. Metson, A. S. Wollberg, San Francisco; S. H. Rich, Oakland.

Glenn Cliff M. Co., San Diego; capital stock, $1,000,000, of which $151,950 has been subscribed; F. Kinney, G. W. Anderson, C. L. Warfield, R. M. Jones, San Diego; I. E. Hill, Los Angeles.

American M. & E. Company, San Francisco; capital stock, $250,000—all subscribed; W. Violman, F. McCue, Lewiston; W. H. Harrison, E. W. McKinley, C. A. Webster, San Francisco.

COLORADO'S GOLD FIELDS.

Millions Upon Millions of Dollars in Gold Have Been Added to the World's Wealth.

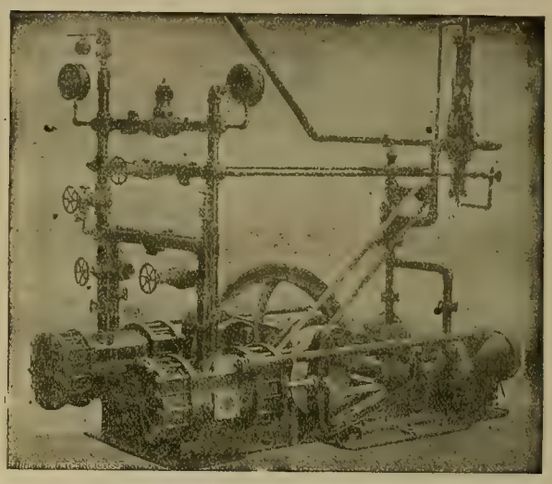
It is a well-known fact that the richest and most famous gold mines in the known world are those of Colorado, many of which are paying to fortunate investors millions of dollars annually in dividends. Some shrewd persons who invested only a few dollars are now receiving hundreds and thousands in profits, and, judging from present indications, there are more desirable chances to invest just now than ever before. New mines are discovered daily and old ones strike richer veins of gold.

In order to meet the great demand for reliable information about mines and mining camps, one of Denver's oldest and best known publishers has just issued a handsomely illustrated book accurately describing every mining camp in the entire State of Colorado, giving scores of truthful photo-engravings of famous mines, mountains, cities, etc. Cripple Creek, the world's wonder, is fully described; also a correct map of the district. Narratives of how many poor people have become wealthy by judicious investments in gold mines, and sketches of former prospectors who are now fixed for life. Tells how to avoid unscrupulous brokers and sharpers. The volume has been carefully compiled by a disinterested author and every statement made is guaranteed to be true. All terms and phrases of miners fully explained; tables showing the State's production of gold and silver for 35 years past. The publisher will send by return mail a copy of the above great book upon receipt of $1 (currency or stamps), which also includes a full-paid yearly subscription to his big 56-column weekly family paper, the *Illustrated Sentinel*, of Denver, Colorado (established 1890). Clubs of 6 and six books, $5. The paper contains each week all the latest mining news and illustrations of Rocky mountain scenery, also true stories of love and adventure.

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

METALS PERFORATED AS REQUIRED FOR

MINING SCREENS OF ALL KINDS



AND FOR USE IN

Milling and Mining Machinery
Reduction and Concentrating Works

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Hydraulic and River Miners Handling Boulders Can Easily Remove Them By Using

The Knox Patent Hydraulic Grapple.

IT WILL DO GOOD WORK AND GIVE SATISFACTION.

PRICE ACCORDING TO SIZE REQUIRED.

Address WM. KNOX, Jacksonville, Oregon, or JAS. ARMSTRONG, 10 Front Street, S. F., Cal.

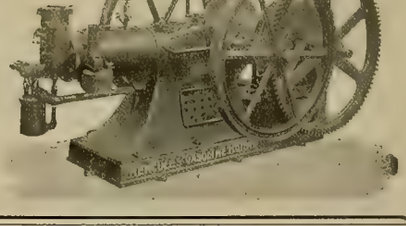
HEADQUARTERS.

Genuine English Pump Leather

For Heavy Mining Pump Buckets. Will outwear any other material and give best satisfaction. Samples furnished on application. A. C. NICHOLS & CO., Leather Manufacturers and Dealers, 404 Battery St., S. F.

POWER FROM GASOLINE? YES. It's Very Economical, Simple, Safe and Reliable. *and Weber Gasoline Engines require no engineer. His salary goes in your pocket. For information address*

WEBER GAS & GASOLINE ENGINE CO., *430 S. W. Boulevard*, Kansas City, Mo.



HERCULES GAS, GASOLINE AND DISTILLATE ENGINES.

HOISTING ENGINES, 2 h. p. to 200 h. p
STATIONARY ENGINES, 1 h. p. to 200 h. p.
MARINE ENGINES, 2 h. p. to 200 h. p.

Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running. Just ½ your expense SAVED BY USING A HERCULES in place of ANY other. We make no exception.

NEARLY 3000 HERCULES HOISTING, STATIONARY AND MARINE ENGINES IN ACTUAL USE. HIGH GRADE.

We claim full power, automatic and positive adjustment regulating speed and consumption of fuel in proportion to work being performed. No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.

WRITE FOR ILLUSTRATED CATALOG.

ESTABLISHED 1880. Address HERCULES GAS ENGINE WORKS,

Dynamos for Electric Lighting and Depositing Metals.
D. D. WASS, Electrical Engineer, 56 First Street, San Francisco, Cal.

Mining Summary.

CALIFORNIA.

Amador.

Republican: In the Argonaut an ore shoot at least 300 feet in length has been uncovered in the 1250-foot level. It is not all high-grade—indeed, most of it is low-grade ore. There is little question that the erection of a 40-stamp mill will be pushed ahead in the spring.

Record: Superintendent Porter has day and night shifts engaged in driving ahead the three tunnels to tap in depth the east vein of the Balliol Mining Company. They will supply the mill by cars filled from ore chutes located in the tunnels, and these will be supplied from the large ledge by blasting in an open cut, the ore falling into the chutes from the bottom of the main pits. Mr. Porter claims that he can mine and mill the ore at a cost of 60 cents per ton. It is expected to start the new 40-stamp mill by February 1.

Ledger: J. E. Dye, manager of the Jackson E. and D. Co., has sold a three-fourths interest in the '49-Flat placer claim of J. C. Bell and others.

The Oneida Mining Co. has bonded or bought the Eureka property at Sutter Creek. This mine has not been operated for twenty years. The sha t had been sunk about 2200 feet and levels opened when the works were consumed by fire, causing the abandonment of further operations.

At the Mitchell mine, near Railroad Flat, a 10-stamp mill has been completed. Crushing is expected to begin immediately.

Another strike has been made in the Kennedy mine. A few weeks ago on the 1950-foot level a body of high-grade ore 8 feet wide was cut. An upraise was made on it. As the workmen raised the ore body grew narrower, until at the height of 40 feet it pinched out. A drift was then started for it on the 2100-foot level, where the bonanza was cut again, but at this place it was 20 feet wide, with a rich streak on the hanging wall. A drift was also started north on the ledge at the 900-foot level, calculating to run it to the Oneida line, the adjoining mine, a distance of 1300 feet from the north shaft. At a distance 800 feet from the shaft they cut a chute of $15 rock.

Butte.

Mercury: A large tract of land in the vicinity of the Magalia mine on Magalia ridge has been bonded to Edmund Harvey, the managing agent of the English syndicate now operating the Banner and Pete Wood mines and owner of the Golden Feather. He proposes to test the ground with a drill and discover, if possible, the deep channel which is supposed to run through the Magalia ridge. George H. Evans is general manager for the syndicate.

The Pete Woods mine has reduced the force of men to sixteen. The tunnel will be driven 75 feet farther into the mountain, when it is expected the channel will be tapped.

Mercury: At Cherokee over one hundred men are engaged in the claim of the Spring Valley Gold Mining Co. on leases. Thomas Vinton employs forty-five, and three Portuguese companies, in partnership, supply the remaining number.

Register: A Chicago company has bonded the Robinson or Minto mine in Granite Basin and a few days ago loaded three six-horse teams with 13,000 pounds of freight and supplies for the mine. The company will sink a shaft 150 feet and make other developments. There is a 20-stamp mill on the property.

The Wiley mine is being fitted up for work.

Enterprise: At Butte creek the mining prospects are more promising now than they have been for many years past.

Gale and Heppy are opening a rich claim at the Narrows. Mr. Hooper will soon have his claim on Centerville Flat in full blast.

Calaveras.

Citizen: The work of retimbering and repairing the Stickle shaft has been completed. A full force of men is now at work.

The Great Western mine, owned by Frank Baumhogger, started up with new machinery last week.

At the Pine Log twenty-five men are employed. Sinking has reached a depth of about 600 feet.

El Dorado.

(Special Correspondence).—The Septimus Development Company is moving rapidly in the Gold Note and Philadelphia properties. The shaft is 350 feet, and from this point the drift south has reached 150 feet. The hoist is run by steam, the pump and sawmill by water.

Deuch & Craddock are running a tunnel on the old Hattie mine, near town. The vein is from 2 to 4 feet.

The American River Land & Lumber Company, whose great timber fields are about ten miles from here, have 6,000,000 feet of logs in the river, and they expect to have 3,000,000 feet more by April 1st, when the logs will be floated to Folsom. The sawmill is operated by electricity.

The New Victor quartz mine started their 5-stamp quartz mill January 1st. Their shaft has reached 150 feet, and a tunnel, on a vein of from 2 to 5 feet, has reached 400 feet.

John Ewarts, who for years has been a successful prospector, has again found a good gravel property quite near town.

The shaft on the Big Four, near Garden valley, has reached 65 feet. The drift south is 46 and north 50 feet. The vein is in 2½ feet of good ore.

Placerville, Jan. 4th, '97.

Gazette: Mrs. J. W. Harrison has bought from T. G. Bilty and W. F. Herrick the Garfield mine at Greenwood, and will reopen the lower tunnel, which has been abandoned for years. The tunnel extends in over 500 feet, and there is a ledge 20 feet wide.

Mountain Democrat: The Uncle Sam mine has recently received a lot of tools and lumber to build a shaft to run from the west tunnel.

Inyo.

Register: Capt. J. W. Kelly of Bodie has bonded the Sanger-Danielson copper claims near Saline valley and will develop them.

Kern.

Los Angeles *Times*: At Randsburg the assessment work on all locations made prior to 1896 is being pushed vigorously. Nearly every hitherto idle man in camp is at work, and the sound of blasting is heard continually day and night.

The lack of milling facilities retards work on the mines. At Koehn Springs another five stamps will be put in operation soon in addition to the five which have been running since last summer. At Cow Wells there is a great deal of ore on hand ahead of the milling capacity of the place. There are several mills going up there, which will add at least twenty stamps, together with one cyanide process. The price remains the same, however, and no low-grade ores can be handled until the capacity of the mills equals or exceeds the supply of ore.

At Koehn Springs the water comes to the surface and the supply is said by an engineer who has examined it, to be equal, with a little development, to 600 inches.

The Southern Pacific Company is considering the advisability of building sixty-five miles of road between Mojave and Randsburg.

Madera.

Mercury: A three-quarter interest in the Syndicate mine, situated near Grub Gulch, Madera county, has been sold. Immediately after the sale rich ore was struck in the shaft. The party purchasing the property is now in San Francisco arranging for machinery for a 10-stamp mill to be placed upon the mine.

Mono.

Chronicle-Union: The consolidation of the best mines in the Bodie district under the one management—of the Standard Consolidated—was a move in the right direction. Next spring there will probably be erected a powerful electric plant on the river a few miles below Bridgeport, for the furnishing of power for the economical working of the series of consolidated mines. In the Bodie district many of the old claims that were familiar in the "boom days" of '78 and '79, but which have lain idle for years, are falling into hands that will work them with more or less energy during the new year, the new cyanide process having given miners more encouragement to work and develop their properties.

Good reports come from the Lundy district of rich strikes in the May Lundy mine.

At Bridgeport the travertine quarry will be worked to a greater extent than ever, as this material will be wanted for inside decorations in fine buildings erected in San Francisco.

The Dunderberg mine and mill will be under full headway at the commencement of the new year.

Nevada.

Tidings: Thos. Nolan has bonded his mining claim on Canada Hill, near the Mayflower, to W. E. Fisher of San Francisco, who will at once organize a company with the intention of developing it.

A bond on the Ellison gravel mine has been given to Geo. Fletcher and John F. Kidder of Grass Valley. The parties bonding commenced work several weeks ago. An incline shaft is to be sunk into the hill.

Union: The New York mine, the principal owners of which are Dr. S. M. Harris, James Burke and James Feeney, has been bonded to a company represented by Henry Power. The New York is situated northeast of the Pennsylvania. It is expected that as soon as Mr. Power returns from the East active work will be commenced.

Transcript: At Washington the Tom Boy ledge is situated on the mother lode and has two pay shoots in it. It is parallel with and 2500 feet east of the Giant King and Worthley & Company's mine. The property has been bonded to W. S. Bell, who will soon begin work.

Placer.

Sentinel: The Wise & Partridge mine at Bruce Canyon consists of a location on a porphyry dike or ledge, which is about 100 feet in width. The ledge runs from north to south and is cut by innumerable seams running diagonally across it. The formation is very soft, a stream of water cutting it very readily. The owners have worked the mine by sluicing for the past three years and it has paid them handsome returns. From a recent seven days' run of fifteen hours per day, with two men, they cleaned up forty-six ounces of gold.

Sunny & McLennan of San Francisco have a working bond of $12,000 on the George Nissen porphyry ledge.

E. W. Chapman, who recently purchased the river claim, comprising about a mile of Bear river lying above the dam of the South Yuba Company, near Colfax, is negotiating for several claims above his.

The Eureka tunnel is now in 1805 feet.

Plumas.

Independent: J. P. Massey, in the early '70s, located a copper claim at Poker Flat, which he soon abandoned. Lately he returned, relocated it and has interested in its development an English syndicate—the Lancashire Development Company. It is the intention of this company to develop the property sufficiently to demonstrate its permanency before proceeding with the erection of extensive reduction works, but in the meantime they have acquired possession of about a thousand acres of gravel land in the McRea ridge which will soon be opened.

San Diego.

The Los Angeles National Bank last week received from the Golden Cross mine three bars of gold bullion aggregating 1374 ounces, valued at $20,000. This represents a twenty days' run, the daily output of the mine averaging nearly $1000. Last month's clean up netted $26,000, and the preceding month $29,000. The bullion is usually shipped from the mine to the Los Angeles Bank to be forwarded by the bank to San Francisco.

Shasta.

Free Press: At Igo Peter Dean of San Francisco has decided to reopen the Hardscrabble mine.

Senator John P. Jones of Nevada has been running a tunnel in a mountain up the creek, and will soon begin taking out ore. The tunnel is now in 750 feet.

A. C. Hamilton of Santa Monica has purchased the Milkmaid mine from John Sonter for $20,000. Mr. Hamilton, who is a brother-in-law of Senator Jones, will at once develop the property and take out the large body of ore in sight.

Sierra.

Mountain Messenger: C. P. Saxton has made application to the U. S. Debris Commission to work the Saxton mine near Genesee, by hydraulic process, to deposit tailings in Little Grizzly creek.

Siskiyou.

Journal: The North Fork of Salmon hydraulic claim has been started up, with a large force of hands, and there is an abundance of water to keep the work going until late in the summer.

Louis Scheld has a force of men working his claim on Yreka Flats in Greenborn gulch.

During the past two years, about $300,000 have been invested in Siskiyou mines. Among the most important sales of the past few years are the two Shinar mines on Thompson creek, one of which was purchased by the Seattle Placer Mining Company, and the other by a company of Colorado capitalists. Both companies have put in extensive hydraulic plants.

The Hunter & Simmons pumping plant at Shasta river is about ready to start up, and by the middle of January work will probably be commenced in the mine at the Simmons place, below Hawkinsville.

News: On the Nelson mine on the North Fork of Humbug, the ledge has been struck with a crosscut 200 feet in length. One tunnel is in 210 feet and the other about 125 feet. This ledge is a continuation of the old Spencer ledge which proved so rich, and the mine is being worked by a strong company.

Tuolumne.

Independent: At Soulsbyville the leaseholders of the Mountain Belle mine are sinking on the extension of the Wheal Perran vein. The rock encountered shows free gold.

The Wheal Perran mine has just been unwatered, preparatory to active work and equipment. This mine was in the early days very rich.

At the Soulsby mine the shaft is sunk now over 200 feet, and stoping is in progress from this level upwards. The 15-stamp mill is nearly completed.

The Black Oak is shipping for treatment to Selby & Co., San Francisco, large quantities of their concentrates, as well as their high-grade ore.

Superintendent Storm of the Junction mine has everything ready for his machinery.

Yuba.

Marysville *Appeal*: A deal has just been made by a Chicago syndicate whereby the property of the New Blue Point Gravel Mining Company at Smartsville, including the New Blue Point mine, thirty miles of ditch embraced in the water system and 2300 feet of tunnel which cost originally $300,000 will pass from the New Blue Point Company and Paddy Campbell to the investors within sixty days. The price paid is understood to have been $100,000 for a two-thirds interest in the property.

NEVADA.

Romanzo Trefethen, who superintended the erection of the mill at the Dexter Mining Company's plant at Tuscarora, says that they have ore enough in sight to keep the mill in operation for at least five years. The means for extracting the values from the ore in early days were very imperfect, and the result was that in the mill dumps are tailings of the value of $20 per ton. In these dumps or ponds into which they were discharged by the former owners, it is estimated that there are at least 9000 tons that can be successfully treated at a cost not to exceed 90 cents a ton. For the handling of these tailings the company has provided itself with a cyanide plant, while the crude ore is put through mills that save about 65 per cent of the values. At present the company is saving between 85 and 90 per cent of the contents of the ore with the use of the mills and cyanide plant, and that the saving will be increased the present season is now practically assured. The ore in the Dexter varies in its valuation from $8 to $560 per ton in silver and gold, while in one level is a breast that averages over $70. On the main dumps are over 30,000 tons of milling ore.

White Pine *News*: The Star Mining Company are pushing work with all the men they can work to advantage.

Yerington *Rustler*: The Messrs. Bliss have been at Dayton to consider the question of working the mines on the flat, if they can find a suitable place to cut to the Carson river.

At Silver City the Pollard mill is again crushing rock.

The new owners of the Succor mine have resumed work on the north end.

OREGON.

Grant's Pass *Mining Journal*: Van Dorn brothers have a giant and 600 feet of pipe for their ground on Pickett creek. Mr. Woodcock of Kerby has purchased a giant for a placer mine on the Illinois. Campbell & Gould, on Green's creek, are running their pipe and giant. Belding & Dowell are working their ledge on Green's creek. They have a 12-inch vein of $25 ore which has been traced on the surface for 500 feet.

Medford *Mail*: The mining interests of southern Oregon continue to attract a great deal of attention. People are constantly coming to examine the placer and quartz properties.

B. P. Dunphy has in hand 800 acres of placer mines on Gall's creek. They have been worked by two men for more than thirty years. The ditches to supply the water are complete, and two houses for workmen and a boarding house have been built.

Baker City *Bedrock-Democrat*: The last monthly cleanup at the Bonanza was $20,000, the result of twenty-six days run with twenty stamps.

The Climax mine, an extension of the Ohio, in Cracker district, is developing into a valuable property. G. W. Grayson, of the Virtue, is the owner.

The indications for a good placer season are flattering. The snow in the mountains is deep and made compact by the late rains.

WASHINGTON.

Spokesman-Review: James Woods and E. A. Stephens of LaGrande, Or., have purchased for $30,000 the Bull Frog in Okanogan county.

The Ivanhoe is producing considerable mineral from the 500-foot level. This ore is rich in native silver and is running well in gold.

The Allison group, which was sold to a Chicago syndicate some time ago, is also being worked successfully. A 150-foot tunnel has just been completed.

The Palmer Mountain Gold Mining and Tunnel Co. are prosecuting work on the big tunnel with a double shift of men. The rock through which the tunnel is driven is highly mineralized. They expect to cut the first ledge, which is exposed on the surface, in the next few weeks. This tunnel will be 3600 feet long and will attain a depth of 1300 feet and may eventually be continued clear across Palmer mountain, a distance of six miles.

The sale of the Bonanza Queen group of mines, near Silverton, has been consummated and Dennis Ryan of Minnesota has become the owner. It is said the price paid in cash was $250,000.

Ellensburg *Capital*: Articles of incorporation of the Blue Jacket Consolidated Gold Mining Company have been filed. The mine, which is a free-milling proposition—decomposed quartz—is at Nelson's Siding. Two well-defined ledges have been discovered, one showing a width of 7 feet and the other 9 feet. It is expected to erect a mill shortly.

Spokesman-Review: The Young America mine, near Bossburg, will soon be in active operation again. The property gained an excellent local reputation a few years ago, and a large amount of ore, valued at $60,000, was marketed. When the decline in silver and lead came, work was suspended.

BRITISH COLUMBIA.

Nelson *Tribune*: The following are returns of shipments of bullion, matte and ore from the mines and smelters in southern Kootenay since last week's report:

BULLION AND MATTE.

	Pounds.	Customs Value.
Trail smelter	570,167	.....
Hall Mines smelter, Nelson, matte	77,480	.....

ORE.

	Tons.	Approximate Value.
Payne mine, Slocan	202	.....
Reco mine, Slocan	58	.....
Wellington mine	15	.....
Last Chance mine, Slocan	34	.....
Goodenough mine, Slocan	17	.....
Rambler mine, Slocan	17	.....
No. 1, Ainsworth	16	.....
Slocan Star mine, Sandon	80	.....
Idaho mine, Slocan	20	.....
Ruth	60	.....
Whitewater mine, Slocan	30	.....
Total for week	949	$169,676
Total so far for 1896	29,514	$3,416,628

Spokesman-Review: The shipments for 1896 from Rossland were as follows:

Mines.	*Lbs of Ore.*
Le Roi	55,331,900
War Eagle	18,019,191
Iron Mask	1,408,260
Josie	1,148,000
Poorman	678,900
Crown Point	300,000
Mayflower	200,000
Cliff	150,000
Evening Star	54,000
Total	77,290,751
In tons	38,645

There may have been other shipments made from Rossland, but this is all that could be obtained. Calling it 40,000 tons in round numbers, it is a remarkable showing for so young a camp. It is impossible to obtain the data as to the average value of the ore from any one mine in order to fix the value of the product of the district.

The Hall mines smelter, at Nelson, has treated 30,000 tons of ore and produced 2350 tons of matte. According to the best reports, the Trail smelter has produced 3055 tons of matte. There have been shipped from the camp at Ainsworth 1164 tons of ore. The Pilot Bay smelter has not been in operation for several months, but for the time it was in operation it produced this year 1012 tons of lead bullion.

The Kaslo-Slocan country stands next to the Cœur d'Alene in the point of value of its production. From the best sources it is learned that the district has shipped 28,245 tons of ore during the year, divided as follows: Slocan Star, 7500 tons; Payne, 2500; Washington, 1400; Ruth, 1120; Noble Five, 1000; Iron Hand, 750; Slocan Boy, 600; Reco, 600; Wonderful, 400; Last Chance, 350; Lucky Jim, 280; Monitor, 225; Enterprise, 200; Whitewater, 200; Rambler, 150; Goodenough, 150; Surprise, 120; Northern Belle No. 2, 100; Mountain Chief, 100; Ivanhoe, 100; Black Fox,

60; Northern Belle, 45; Antoine, 15; Wellington, 75; London, 15; Chambers, 15; Nepawa, 20; American Boy, 45; Ajax, 30; Carnation Read, 15; Bluebird, 15. Total, 28,245 tons.

A few other mines have shipped various small amounts. The number of mines in the Slocan from which ore has been shipped during the year is something over forty.

Rossland *Miner*: On Dec. 1 the townsite of Salmo was an unpeopled landscape. Since that time two hotels and two stores have been completed and occupied; a third will be completed in ten days, and contracts have been made for twelve new buildings to be finished within ninety days. A sawmill will be in operation in thirty days. Nearly 2000 claims have been recorded upon the Salmon river and its tributaries within a radius of six or eight miles of Salmo.

Work has been started on the long tunnel to be run through the Gopher and the Homestake, to make connection with the working shaft of the Homestake. This follows close upon the purchase of the Homestake property by D. M. Linnard and associates. The R. E. Lee, Maid of Erin, Gopher and Homestake are to be worked together under one management. The new tunnel will run 800 feet on the Gopher and 400 feet on the Homestake.

Spokane *Chronicle*: The owners of the Slocan and Center Star mines at Rossland have determined to build a smelter.

G. B. McDermott has sold the Flying Dutchman mineral claim in the McMurdo basin to Rossland parties for $15,000.

Both the mine and mill of the Slocan Star are running full blast, handling in the neighborhood of 200 tons of ore a day.

Work is being pushed on the mine and mill of the Noble Five, and it is thought that by the middle of next month the new 120-ton concentrator will be completed and ready for work.

The Globe Mining Company has received news from Kaslo stating that a new 3-foot galena ledge has been discovered on the Victoria, one of the claims owned by the company.

At Fairview the Joe Dandy, which is under a bond to eastern Canadian parties for $60,000, is being worked by twenty men. A 10-stamp mill has been ordered, which will be in running order early in the spring.

The Stemwinder will be worked by twenty men after the first of the year.

The Buck Horn and the Occidental have both been bonded for $5000, 10 per cent down.

Rossland *Mining Review*: The Great Hopes claim at Deadwood, Boundary creek, has been sold for $12,000.

War Eagle workings are now 320 feet below the surface, and the ore being taken out is the richest yet found in the mine.

UTAH.

Salt Lake *Tribune*: During the year 1896 there was shipped out of the State base metal, bullion, ores, matte and concentrates as follows:

	Pounds.	*Tons.*
Silver-lead bullion	43,395,733	21,697.1733
Silver-lead ores	115,170,760	57,585.0760
Copper matte	3,690,040	1,845 0048
Copper bullion	717,228	358.1228
Copper ore	199 400	99.1400
Copper buttons	35,335	17.1335
Carbonates	27,676	13.1676
Totals	163,236,180	81,618.0180

This is in excess over that of 1895 of 2538 tons. To carry this great mass of metal out of the State required the use of about 4552 cars.

The production of ores in Utah in 1896 was quite large. The low-grade ores concentrated cannot be given as to amount crushed, and hence only the concentrates are embraced in the table following in this article. If the crude ore was counted instead of the concentrates, it would increase our figures quite materially in some districts:

Tintic—	*Tons.*	*Tons.*
Milled	155,500	
Shipped	98,085	253,585
Mercur—		
Milled	132,000	132,000
Park City—		
Milled	49,612	
Shipped	33,153	82,765
Bingham—		
Shipped	46,016	46,016
Horn Silver—		
Shipped	10,041	10,041
Ophir—		
Shipped	5,379	5,379
Silver Reef—		
Milled	2,500	2,500
Little Cottonwood—		
Shipped	1,300	1,300
Fish Springs—		
Shipped	1,315	1,315
Stockton—		
Shipped	1,000	1,000
American Fork—		
Shipped	1,000	1,000
Totals	536,901	536,901

Marysvale, State Line and some small districts produced a little of each, but the quantity was so small that the aggregate would change these figures but little.

At the West Dip in Mercur district H. A. Coben for Capt. J. R. DeLamar will begin the sinking of shafts at a number of points to determine the value of the new locations.

The Mono is to resume work under the direction of Cisborn and Driver, the latter having bid it in at Sheriff's sale.

The Ajax has started up again with fifty men and the exploration of lower levels will be resumed. Since the shutting down of the property on Christmas eve the machinery has been overhauled. The Ajax has yet explored little more than its upper levels, and although the gross output of the mine last year reached $250,000, it was procured from drifts above the 400-foot level.

The Uncle Sam mine at Tintic has been purchased by Jesse Knight for $25,000. He intends to sink as rapidly as possible.

Mercur *Mercury*: Castleman and Hunt have sold the Sego Lily to Andrews and Wallace for $4200. A company has been incorporated and men put to work.

The Geyser people have uncovered a new body of ore on the West Geyser and are getting ready to connect it with the mill by a tramway.

Dignowity is arranging to put a new drilling apparatus, with a gasoline engine at work on his property near the Mercur mill, and a similar outfit on the Black Horse group in the West Dip.

The rush to the West Dip has been unprecedented this week. The South Daisy got down through the wash into the vein, and is now securing values. Capt. De La Mar has secured an option of a few days on the Daisy and South Daisy for $70,000. There are hundreds of men on the dip, prospecting, locating, bonding and buying, and their number is increasing.

The Golden Gate at Mercur have ore still in their shaft at a depth of 480 feet and they estimate having 400,000 tons of $14 ore blocked out. They have 2500 feet of drift southeastward and find ore from 40 to 60 feet in thickness in places.

Eureka *Democrat*: Jesse Knight of the Humbug has purchased the Uncle Sam, adjoining the Godiva, for $25,000 in cash. Active work of developing the claim will begin at once.

J. McChrystal has bought the Rising Sun mine, north of the Gemini group, for $20,000. Active work will be commenced on developing at once.

During the past few months scores of cars of machinery have been received by the various mines in Tintic district.

Bingham *Bulletin*: The Old Jordan and Galena mill is started again and will work in a single shift 100 tons of ore daily.

The ore to be concentrated is iron from the Old Jordan vein, of which there are now about 4000 tons on the dump; but a force is being put on in the mine, which Manager Holden states will be gradually increased to 75 or 100 men if future conditions are favorable.

Thirty-five leasers are now at work in the South Galena mine, and the shipments of first-class ore for January promise to be considerable.

A contract has been let at the Frisco to sink the shaft 100 feet.

Mammoth *Record*: A rich strike has been made in the Mammoth, assays showing 227 ounces in gold.

Men will soon be put on at the Lady Washington, on the vein adjoining the Sunbeam at Silver.

The vein in the bottom of the Sunbeam shaft has widened out to 10 feet, but the ore is hardly rich enough for shipment.

IDAHO.

(Special Correspondence).—Recent development work in Florence now assures the certainty of the permanence of the gold-bearing veins of this camp.

The Ozark.—This mine is running with a big force of men doing development work, and also a crew of men on the mill, getting it in shape for crushing. The work is under the management of M. A. Walker. This property is one of the best in Florence, but owing to mismanagement the former owners lost very heavily. The mill on this property was made by the Risdon Iron Works of San Francisco. The ore on the Ozark is low grade, but there is a big body of it in sight.

Blossom.—Recent work on this property in the shaft has exposed a body of ore which will run well.

Free Coinage. — This property has now passed into the list of producing mines, a vein of ore 5 feet in width and running from $20 to $50 per ton having been exposed. The ore is free milling gold.

Tip Top.—This property has been incorporated under the name of the Tip Top Mining Company. Recently a contract was let to drive a tunnel 250 feet to open the vein at a depth of 125 feet. The ledge as exposed by superficial workings is 8 feet wide and assays $20 in gold and forty ounces silver per ton, and it is free milling. H. Hamlin is manager.

Banner.—This property is showing up well, another ore chute having been recently exposed in the drift.

Gold Bug.—A body of high-grade ore has been opened on this mine. It is 20 inches wide and assays $100 per ton.

A considerable number of transfers of mining property are being recorded in this district, but no sales of any size.

The immense tunnel project being organized for the purpose of developing and draining the camp of Florence will go through. It will mean work for hundreds, perhaps thousands, of men. The plant will be of the most modern design. The capitalization of the company will be $25,000,000, $1,000,000 of which will be preferred stock carrying 6 per cent interest, payable semi-annually.

Florence, Idaho, Dec. 30, '96.

Spokesman-Review: At Burke the Standard is preparing to put out all the ore the mill can handle. Thus far the drilling has all been done by hand, but machines will be used hereafter. Electric lights are now being put in the tunnel. The daily output is between 150 and 200 tons, but enough ground is now opened up to double the output.

Silver City *Avalanche*: The past year was spent at development work on the Poorman property, and the lower tunnel, Belle Peck, has now a length of nearly 4000 feet.

At the Flint mill four Frue vanners have been added. It is thought that more concentrators will be put in and the other ten stamps started.

It is expected that the Cumberland property will be sold within a few days to a Chicago syndicate for about $30,000.

Superintendent Hutchinson gives the Trade Dollar's production for the year at $525,000 in round numbers. Expenses have been $200,000.

MONTANA.

In the Yakh district the Keystone mill, owned by Finch, Clark and others of Spokane, has resumed work and the force has been increased. It is the intention of the owners to enlarge the mill to twenty stamps in the spring.

A force of men will be put to work on the Jim Hill immediately after the first of the year and the claim thoroughly developed.

Mining World: One day last week there were shipped from Sand Coulee 145 carloads of coal of 25 tons each, or a total of 3625 tons. As its neighbor, Belt, is shipping an average of 130 cars a day, it will be seen that the two camps have a daily output of about 7000 tons.

J. C. Sloss of Boulder, who recently secured a bond and lease on the German Bar placers in Madison county, has secured an option on 600 acres of placer ground at the lower end of the gulch.

Western Mining World: The output of the principal mining companies of Butte for the year 1896 is summed up as follows:

Anaconda Copper Mining Company, 107,035,697 pounds of copper; 5,308,956 ounces of silver and 18,300 ounces of gold.

Boston & Montana Company, copper (estimated), 45,000,000 pounds.

The Montana Ore Purchasing Company had a prosperous year, and the production was considered a good one. During the year the company produced 17,083,019 pounds of copper; 619,978 ounces of silver and 24,640 ounces of gold.

The Parrot Company produced during the year about 14,000,000 pounds of copper as well as considerable gold and silver.

The Colorado Company produced during the year not less than 5,000,000 pounds of copper and a large number of ounces of gold and silver.

The Butte Reduction Works estimated output for the year is about 4,000,000 pounds of copper and some gold and silver.

WYOMING.

At Grand Encampment since the middle of September, when the discoveries first became known, a great many people have visited the section, and it is estimated that at the present time there are some 200 miners doing assessment work.

The gulches are very deep and the mountains steep, so that tunnels may be run and strike the ore bodies at depths varying from 600 to 1100 feet. There is in the district sufficient wood and water for all practical purposes. The mineral belt is about 4½ miles wide.

In addition to the lode claims considerable placer ground has been located along the several streams and gulches running through the belt.

SOUTH DAKOTA.

Black Hills *Times*: A recent test run of ninety tons of ore from the Juniper mine, situated near Keystone, resulted in a cleanup of $700. The gold was so coarse that nearly the entire amount was found in the batteries.

A hole will be sunk from the bottom of the Union Hill shaft, now 300 feet deep, to the 500-foot level and the material passed through tested. The shaft is all in ore of good grade and perfectly dry. The bore will determine where water level is and the extent of the ore body.

COLORADO.

(Special Correspondence).—Shipments of ore from Idaho Springs by the three sampling companies having works here were as follows for the year 1896.

	Tons.
State Ore Sampling Co	5,120
W. J. Chamberlain Co	5,400
Dewey Bros	5,000
Total	15,520

Statements from Dewey Bros. show that the ores they handled ran as follows to the ton, viz: gold, 1½ ounces; silver 38 1-5 ounces; and 7 per cent lead, which makes a high valuation for an average. W. J. Chamberlain company's bulk averaged about $37 per ton in values. That of the State Ore Sampling Co. ran about the same as the others. The above shipments all went to the smelters at Denver and Pueblo. This does not constitute all the ore shipments from the district, by any means, as that sent out from individual sources amounts to a large item, though it is difficult to get at definite figures.

The numerous stamp mills and concentrators probably handle about half the ores of the district. The mineral output of Clear Creek county, it is estimated, will reach approximately $3,000,000 for 1896

The ores of the county are of a generally refractory nature and much of the mill work is primarily to save the concentrates.

The Silver Age concentrating mill is closed down, John G. Roberts, who has had it leased, having given it over to the owners, and is remodeling the old Freeland mill.

The Mixell stamp mill is operating with its fifteen stamps. Recently a test on this mill showed the following: 21,360 pounds of ore were crushed, sampled and assayed, showing a bullion value of $129—$77 in gold and $52 in silver. The results of milling gave in gold and concentrates, $121.32—$72.20 in gold and $49.12 in silver. Mr. Mixell uses the slow-drop stamps.

The Lamartine mine, up Chicago gulch, is steadily operating with a force of about 100 men and producing a high grade smelting ore.

The one thing favorable to Clear Creek county is the abundance of water for all kinds of milling purposes and power. Practically all the mills of the district are operated by water power, as is also the machinery of most of the big mines.

Work on the Newman tunnel is progressing, the present workings being in over two miles.

'WASCOTT.

Idaho Springs, Col., Dec. 31st, '96.

(Special Correspondence).—In Gilpin county the Gold Coin Mines Company own and operate the Indiana and Kansas groups above Nevadaville, and operate the Hidden Treasure, in the same locality, under lease from the California Company. These properties output both smelting and milling ores.

The Vendome Company, which bought out the Hubert properties on Prize hill and vicinity, produced $127,000 in values within the year. Of this about $71,000 resulted from smelting ores and the balance from mill dirt. They have a very large territory of mineral ground, and their developments are extensive. One of their properties, the Hubert, is over 1100 feet deep and has paid $300,000 in dividends.

A characteristic of the Nevadaville section of the district is a granite and gneiss as country rock, with a vein filling of porphyritic lime, having an iron and copper base.

The Gregory-Bobtail, which has been under bond and lease to Clinton, Reed & Co. of Denver, it is reported, will change hands soon. The Bobtail tunnel, or incline, is in over one mile, and was put in almost solely for development purposes.

The Sleepy Hollow, Fisk, Ophir-Burroughs, Belmont, Old Colony, First Centennial and Alps are being worked largely by tributers. While each property makes its own regulations and exacts a royalty which depends upon grade of ore blocked out to each tributer, the system works well here under well recognized general rules. Where regular leases are taken on properties for terms of three to five years, the royalty is usually 10 per cent on milling ore and 15 per cent on smelting ore. The fact that such a very large number of men are employed in connection with the leasing system in some way or another, has always been a factor in the easy settlement of all labor troubles of this district.

The motor tramway, which has nearly forty miles of track, reaches practically all the mining centers of the district and greatly facilitates the milling and shipment of ore.

Estimates at this time place the mineral output of Gilpin county, in round numbers, at $3,000,000, which is principally gold.

Central City, Dec. 31st, '96. WASCOTT.

Denver *Republican*: The deed has been recorded transferring a one-fifth interest in the Strong mine of Cripple Creek from the American National Bank of Denver to E. W. Giddings of Denver. The price paid was $45,000, which would make the property worth $225,000.

The Portland has at last got the flow of water encountered last week under control, but it came within a few feet of flooding not only the seventh but the sixth level as well.

A bond in the sum of $55,000 has been taken on the E. T. C., on Galena hill, by M. S. Rupp. The lessee is required to do thirty-five shifts a month, and has until February, 1898, to complete the purchase of the property.

The Anglo-Colorado Exploration syndicate is getting good ore from the new shaft on the Rigi, on Battle mountain, and in the past week has made two shipments, one of milling ore averaging $30 a ton and the other lot a good high-grade, going above $100.

At Aspen the strike recently made in the Alta Argent mine in this city, on the blocks under lease to the Copeland syndicate, is holding splendidly and ore of the average value of fifty ounces is being shipped regularly.

This week saw the completion of the sinking of the Free Silver shaft to the 1200-foot level and the conclusion of a piece of mining work of considerable magnitude. This gives the Free Silver the deepest workings in the district.

NEW MEXICO.

Silver City *Enterprise*: At Pinos Altos sixteen men are employed in the stopes of the Mountain Key on the first, second and third levels. The ore extracted is reduced in the Chilian mill on the mine, with good results in gold. The force of miners will soon be increased. The mine will be pumped out below the 300-foot level.

The Treasure Mining Company, composed of Denver capitalists, has developed a paying property out of the Atlantic mine. The 10-stamp mill crushes about twenty tons of ore per day.

The Golden Giant is working thirty-five men in the mine and mill. The main shaft has attained a depth of 78 feet below the 350-foot level; 22 feet yet to sink to where the 450-foot level will be started.

Santa Fe *New Mexican*: At Hopewell district, in Rio Arriba county, on the Revenue claim they are in 226 feet on the tunnel and have cut three veins, one running $17.

The Iron Mountain Company is in 150 feet on its tunnel in Iron mountain and has cut a 5-foot vein that assays $15.

The Altamont tunnel is in 401 feet.

The tunnel being run by Nebraska parties on the Good Hope is in 275 feet.

J. P. Renker has the tunnel on the Sidney in 100 feet.

H. H. R. Brownell has organized a company —capital stock, $300,000—on the Exchange claim, with Wright of Denver, Wyant, Brownell, Victory and Pope, of Santa Fe, directors.

ARIZONA.

Tucson *Star*: At Oro Blanco the Oro mill with ten stamps is crushing twenty tons each twenty-four hours. Twenty-five men are employed in the mill and mine.

The Old Glory mill has closed down. It has ore-crushing capacity for only twenty stamps and is adding enough ore crushers to supply the thirty stamps of the mill.

The Tres Amigos mill, with a fifteen-ton capacity, is running steadily on free gold ore with good results.

Jerome *Mining News*: W. A. Clark will put a force of men at work developing copper mines near Tucson.

Silver Belt: At the Continental copper mines, at Globe, work of development has been commenced.

Work will be started immediately on the Pinto Creek Mining and Smelting Company's properties on Pinto creek. The ledge is large and the ore is rich in copper and carries considerable gold.

H. Klaustermeyer has let a contract to further develop the Cleveland mine. The ore is a lead carbonate, carrying 40 ounces of silver to the ton.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

Tintic Mining District, UTAH.
The Tintic Mining District lies eighty-five miles south of Salt Lake City on the Rio Grande Western Railway, and is, as shown by the records of 1895 and so far in the present year, the greatest mineral producing district in Utah.
The names of the great bonanzas of Tintic, the Mammoth, Centennial-Eureka, Bullion-Beck, Eureka Hill and Gemini are recognized everywhere that the mining industry is known. The four former have each a record exceeding $1,000,000 in dividends and the latter of over $600,000.
Until within the last two or three years no adequate means of reduction of Tintic ores was in operation in the district and the production of the mines was limited to those ores sufficiently rich to be shipped to the smelters for treatment, but this has been changed by the erection of immense combination and concentration milling plants which can work at a profit those immense deposits of low grade ores which fill all the producing mines of the district. Four of these mills are in active operation, and three others will undoubtedly be erected within the next year.
The ores of Tintic are greatly diversified in character. The principal metals produced are gold, silver, copper and lead. In silver production Tintic leads the State, while in the production of gold it stands second on the list. Beside the big bonanzas above mentioned there are some twenty-five or more properties that now and in the past have been producing mines, and to these may be added a score of others which have paid for their development by their products, and upon which the recent revival of the mining industry has had the effect of a recommencement of operations.
Tintic has four thriving towns—Eureka, the business center of the district, with a population of 2,500; Mammoth, population 1,000; Robinson and Silver City, 500 each, all of which offer great inducements for investments in a business way.
At the base of the foot hills only a few miles away, is a valley of 25,000 acres of choice fruit and garden lands, watered by the Mt. Nebo Land and Irrigation Company.
As to the future of Tintic, it is no exaggeration to say that it possesses the brightest prospects of any mining district in Utah, and offers to the prospective inventor opportunities which cannot be excelled.
The Rio Grande Western Railway has a double daily train service between Salt Lake City and the Tintic Mining District. For further particulars apply to F. A. WADLEIGH, General Passenger Agent, Salt Lake City.

DEWEY & CO., Patent Solicitors, 220 Market St., San Francisco.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 7, 1897.

Trade has not recovered from mid-holiday dullness, but merchants, manufacturers and business men in general are quite confident that a revival will set in before the close of the current month. There is not only a feeling that general trade will begin to revive, but it will increase in volume as the spring months draw near. The consensus of opinion is that retail distributors in all parts of the coast are carrying light stocks which will require not only filling in, but an increase carried in almost all lines owing to all information pointing to an enlarged consumptive demand. From those in position to know the opinion prevails that manufacturers, particularly those engaged in machinery and structural material, will enjoy an exceptionally good business. Tariff legislation continues a disturbing factor and until this is well out of the way it will show more or less influence on the general situation.

In the local money market disbursements usual in this month are being made. As these will aggregate several million dollars on this coast, they will tend to further ease in the markets, as the funds begin to seek the usu l reservoirs for investments. Bank failures at the East have no perceptible influence here, as the institutions that have suspended are said not to have been conducted on well established conservative banking lines, besides the conditions which brought disaster to them are with the past and have no bearing on the future. The East reports continued ease at Atlantic seaboard financial centers, which will be made still more easier as the heavy disbursements go into general circulation. There are fears that gold exporting will be commenced soon; but this, even if it is done, ought to be on a limited scale, by reason of Europe not unloading American securities on us, besides which our exports of products are in excess of the imports. European advices indicate that there is a tendency to more ease at the financial centers, notwithstanding Germany is absorbing gold.

New York Silver Prices.

NEW YORK, Jan. 7.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
*Friday	29 13-16	64⅞
Saturday	29 13-16	64⅞
Monday	29¾	64¾
Tuesday	29¾	64¾
Wednesday	29¾	64¾

*Holiday.

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.84½
London Merchants	$4.84
London Sight Bankers	$4.88
Rebned Silver, per oz., 1000 fine	64¾
Mexican Dollars	51½@52½

SILVER.—In sympathy with London the markets at the East and on this coast have weakened. The decline in London was due to the allotment of India Council bills. The India Council was forced to this owing to continued stringency in the money markets there, aggravated by the impoverishment of the mass of the people by the drouth. The opinion prevails that silver will begin to show more strength soon.

The highest and lowest monthly prices compare as follows:

1896—	New York (cts.) High.	Low.	London (pence.) High.	Low.
January	67½	66¾	30⅞	30½
February	68⅞	67¾	31 9-16	30¾
March	68⅞	68	31 9-16	31⅛
April	68¾	67⅞	31 3-16	30 13-16
May	68⅝	67⅝	31¼	30 15-16
June	69⅛	68¼	31 9-16	31 3-16
July	68⅞	68½	31½	31⅜
August	69⅝	65¾	31⅜	30⅜
September	66⅝	64¾	30 11-16	30
October	65¾	64⅜	30 5-16	29¾
November	65¼	64½	30 3-16	29¾
December	65⅝	64⅞	30	29 13-16
Highest	69⅛	....	31 9-16	.....
Lowest	....	64⅜	.....	29¾

In December, 1895, the highest London price was 30 11-16d and the lowest was 30d. The highest New York price was 67⅛c and the lowest 65⅝.

MEXICAN DOLLARS.—The market is quiet but prices have not gone off so much as had been looked for. New York quotations come through at 51¼ to 52 cents according to quantity and quality.

ANTIMONY.—Our market is quoted at 7½@8c in a jobbing way. New York mail advices quote 7¼c for Cookson's, 6¾@6¾c for Hallett's and 6½c for Japanese.

QUICKSILVER.—The market is practically unchanged. Receipts for the year ending with December 31, compare as follows in flasks: 1896, 25,558; 1895, 32,747; 1894, 28,080. The exports compare as follows: 1896, 26,995; 1895, 30,401; 1894, 31,988.

The market is quoted as follows:

Domestic trade, per flask 36 40

For export, quotations are nominal but less than for home.

COPPER. — The market shows more strength. The East reports a good export and domestic demand for the season of the year. There seems to be more disposition to buy for future delivery when asking prices are not considered too high.

Ingot, jobbing	14¼@—
Ingot, wholesale	13¾@—
Sheet copper	17 @—
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

LEAD.—The market has ruled slightly firmer at the East, in which ours sympathized. This is doubtless due to smaller supplies and expected favorable tariff legislation.

Pig	— @ 3 75
Bar	— @ 4 00
Sheet	— @ 5 25
Pipe	— @ 4 50

SHOT.—There is a good seasonable demand.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

BORAX.—The market is steady at current quotations. The export movement last year was largely in excess of both 1895 and 1894.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

TIN.—There is more inquiry, but no change in quotations, although the East reports slightly higher prices for pig. Imports of plate are fair.

Pig, per lb	14¼c@—
Plate, I C coke, heavy, per box	— @$4 05
" " " light, "	— @ 3 95

IRON.—The market seems to be more or less in an uncertain position, owing to reported closer competition at the East. It looks as if, in the Central States, lower prices for steel rails will have to rule, owing to conclusion of negotiations between the Carnegie Steel Company and the Rockefeller interests, by which the Steel Company acquires control of the best ore properties on the Mesaba range from the Rockefellers. The agreement provides for the shipment of the ore in the Rockefeller steamers to Conneaut, where it will be turned over to the new Pittsburg, Bessemer & Lake Erie Railroad, controlled by the Carnegie Company. This will have a very material bearing on iron ore, which must also go off in values, as the larger interests will try and crush out the smaller.

We quote as follows:

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

LUMBER.—There is nothing new to report.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

COAL.—The general situation is practically unchanged. The tone of the market is firm with the tendency to higher prices for cargoes in all positions.

SPOT FROM YARD—PER TON.

Wellington	$7 50	@	8 00
Greta	6 00	@	6 50

POWDER.—The demand is fair.

The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

Mining Share Market.

SAN FRANCISCO, Jan. 7, 1897.

The market has been more active the past week, with trading confined largely to the Gold Hill shares under the lead of Challenge, Confidence and Belcher. The improvement in the market is said to be due to confirmed reports that the west crossdrift in Alpha had struck the red, or west lode, which, reports state, is largely gold-bearing quartz. From all that can be learned, it is safe to affirm that the management will not uncover high-grade ore, but it may prove of sufficient value and width to cause the shares to command quite an advance on present prices. As Alpha lies between Exchequer and Con. Imperial, which latter adjoins Challenge, the shares of these two mines ought to sympathize. The work hat is being done in Confidence and Challenge, although the latter is not reported, is said to be also on the west lode; but care seems to be taken not to develop enough ore to cause outside buying. The activity in Belcher is largely due to a contest for control by A. Krause and associates. It is stated that the contestants are having the books of the company overhauled; that the official letters from this mine have not, for many months at least, been satisfactory—not conforming to the requirement of the law under which the company was incorporated. There are those who believe that much better reports could have been made, and also considerable more ore taken out and the mine made to pay. The shares of the middle and north end mines strengthened slightly in sympathy with the move in the Gold Hill mining shares. The Standard shares are now called regularly, as Bodie, Mono and Belcher have been consolidated with it. They do not, as yet, attract much attention, but probably will if they sell higher and dividends become a reality, and not a promise.

The following companies had cash on hand January 1: Andes, $3535, Alta, $1161, Alpha Con., $4429, Belcher, $5000, Bullion, $2172, Best & Belcher, $2440, Caledonia, $3357, Con. New York, $630, Challenge Con., $2634, Chollar, $357, Con. Imperial, $1000, Confidence, $3582, Con. Cal. & Va., $4945, Exchequer, $1603, Gould & Curry, $1235 (with $2500 owing to the Nevada Bank), Justice, $374, Mexican, $10,075, Overman, $8214, Ophir, $6082, Occidental Con., $4373 (with $2500 due the bank), Potosi, $9068, Savage, $292, Seg. Beicher, $2805, Syndicate, $586, Sierra Nevada, $9595, Standard Con., $42,050, Union Con., $10,980, Utah Con., $1489.

The following companies report an indebtedness: Crown Point, $2004, Hale & Norcross, $19,995, with monthly expenses to be paid, and $26,547 to be collected on the pending assessment, Lady Washington, $866, Silver King, $2084.

From the Comstock mines official letters are largely made up of the number of feet run from points which would puzzle even experienced miners to find with any degree of correctness. In Utah they are running a south drift, passing through low-grade quartz. In Sierra Nevada they are driving a west crossdrift on the Layton tunnel level. They make about 13 feet a week. In Union they are running on the 900-foot level a north lateral drift and another from an upraise above this level. About 50 feet from the Ophir line Mexican is driving a west crossdrift on the 1000-foot level. The material reported in last letter was porphyry and clay seams. In Ophir active exploiting work is being done on the Central tunnel level. On the 1000-foot level repairs have been completed and work resumed. The work in Con. Virginia is confined to the 1000-foot, 1650-foot and 1750-foot levels. The official letter is not of an encouraging character, although there is no telling what may come any day from the work that is being done. No ore is being extracted. They are exploiting the 900-foot level of Hale & Norcross. No ore was extracted last week. The monthly statement filed of expenses and income for December is a model that other secretaries might follow with credit. This statement shows that the mine is well and economically managed. In Savage the usual work is being done. From Potosi and Chollar we are without advices as to the work, if any, that is being done. In Bullion work has been resumed on the north drift. No work is being done by Exchequer. Work to the west is still the order in Alpha. North and south lateral drifts will, it is reported, be run along the ledge struck last week. Work is being done to the west in Con. Imperial. One crossdrift is being run by that company and another jointly with Challenge and Confidence. No change is reported in Confidence work. A few tons of ore is raised each week. Belcher and Seg. Belcher continue to raise a few tons of ore, but from what level and as to the work that is being done the official letter is silent. A few tons of ore is raised each week by Overman. No change is reported in the work in Alta.

The movement in the shares of the Comstock mines is drawing attention from the Brunswick lode. In Occidental they are sinking on the ledge cut on the 550-foot level. They are running a southeast drift on the 750-foot level. In Chollar they are running two new crossdrifts south of the two first run on the 400-foot level. They sent to the mill over 100 tons of ore assaying over $70 a ton, with the silver calculated at par. The work at other points in the mine is practically unchanged. In Savage no change is reported in the work. In both Gould & Curry and Best & Belcher they are working on the 300-foot and tunnel levels. Nothing of an encouraging character is reported in the official letters.

From the Bodie district the official letter regarding work in Standard is of a very encouraging character.

The following illustrates the changes of the week:

Mines.	Dec. 30.	Jan. 7.
Alpha	.....	$ 17

Recently Declared Mining Dividends.

Alice, Utah, $25,000; payable Dec. 31, 1896.

Swansea, Utah, $5000; payable Jan. 4, 1897.

The Swansea Mining Company of Utah, $5000; payable Jan. 6th.

The following dividends were paid in Utah in 1896:

Centennial Eureka (15)	$ 150,000
Silver King (11)	412,500
Bullion-Beck and Champion	200,000
Mercur (9)	225,000
Ontario (12)	180,000
Mammoth	100,000
Dalton & Lark (6)	75,000
Galena, Fish Springs	50,000
Horn Silver (1)	50,000
Daly (1)	37,500
Utah, Fish Springs	24,000
Swansea	30,000
Sacramento (3)	12,000
Geyser	10,000
South Swansea	7,500
Total	$1,913,500

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DEC. 29, 1896.

573,847.—FURNACE DOOR—E. M. Andrus, Mitchell, Or.

574,189.—FIREARM—H. Carr, S. F.

574,340.—FIREARM—R. M. Catlin, Tuscarora, Nev.

573,963.—WATER ELEVATOR—J. M. Corn, Tempe, A. T.

573,966.—INSULATOR HANGER—R. Duncan, S. F.

574,311.—GAS ENGINE—J. W. Eisenhuth, S. F.

574,061.—PROJECTILE—G. Gustave, Los Angeles, Cal.

573,980.—RAILWAY RAIL BOND—B. Jennings, San Jose, Cal.

574,365.—BOX NAILER—H. R. Kumler, Etiwanda, Cal.

574,069.—PHOTOGRAPHS IN RELIEF—T. C. Marceau, S. F.

574,071.—WHIFFLETREE—W. A. O'Bar, Everett, Wash.

574,041.—CAR FENDER—M. Rings, Seattle, Wash.

574,075.—SYRUPING MACHINE—F. A. Robbins, S. F.

574,288.—HAIRPIN—J. W. Timmons, Callam, Wash.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COIN-HOLDERS.—Charles A. Webster, Oakland, Cal., assignor of one-half to George B. McClelland of same place, and Milton F. Webster, Spokane, Wash. No. 573,251. Dated Dec. 15, 1896. This invention relates to a device for holding coins so that they may be conveniently extracted. It is especially designed to hold nickels and other small coins which are used for paying fares upon the cars, and for other similar purposes, so that said coins can be easily extracted singly and successively. It consists of one or more channeled sections adapted to receive coins, having springs at the upper end, between which the coins are introduced, and springs at the lower end to prevent the coins from falling out by gravitation. Openings are made in the lower end upon opposite sides of the space containing the lowermost of the coins, so that it may be grasped and removed, the springs which hold it yielding sufficiently for that purpose. The sections containing the coins are hinged together, and the device is attached by a pin or otherwise to some convenient point about the person of the user, whereby the coins are always within convenient reach.

BEER-DRAWING APPARATUS.—J. R. Young of San Jose, Cal., assignor of three-quarters to Charles M. Gardner, Louis H. Hartmann and John Shields Jr., of same place. No. 573,172. Dated Dec. 15, 1896. This invention relates to an apparatus for drawing beer, and other liquids under pressure, without permitting the escape of gas. Its special object is to draw beer directly from the keg, so that the gas will be retained, and a suitable pressure maintained to keep the beer sharp and sparkling until the keg is exhausted, while preventing the undue foaming of the beer. It consists in the combination of a pressure chamber connecting with the liquid passage from the keg, a long conical valve intervening and controlling said communication, a spring acting behind the valve in conjunction with the pressure in the chamber to automatically close the valve against the pressure upon the keg and means for relieving the valve of the spring, as the pressure in the keg decreases. An adjusting screw serves to move the washer so as to press the spring away from the valve.

ELECTRIC RAILWAY.—Anson Sprague, San Leandro, Cal. No. 573,169. Dated Dec. 15, 1896. This invention relates to improvements in electric railways. It consists essentially of a channeled insulated surface rail having a conductor fixed to it, a pivotally secured lever having a trolley to engage the conductor, a second lever by which the trolley lever is carried with an intermediate slide, whereby the trolley is moved into and out of contact with the conductor.

EJECTORS FOR MINING AND DREDGING.—William Muir, Michigan Bluff, Cal. No. 573,611. Dated Dec. 22, 1896. This invention relates to a device which is especially designed to raise water or sand, mud and gravel for mines or depressed locations, and for dredging bay and river bottoms, etc., and to eject the material at a considerable distance

above the point from which it is raised into lighters or other receptacles. In this apparatus a column of water is delivered under pressure into a supply and a discharge chamber with an intermediate suction chamber, the two having passages axially in line, a cylindrical pipe opens into the suction chamber at one end, the nozzle fits in the said pipe and is independently adjustable in the funnel-shaped sleeve in the opposite side of the chamber and longitudinally adjustable with relation to the discharge pipe.

ODORLESS CREMATORY.—C. W. Lent, Oakland, Cal., assignor to the Odorless Crematory Co., same place. No. 573,605. Dated Dec. 22, 1896. This invention relates to an apparatus for destroying garbage and other material by heat and at the same time disposing of all noxious fumes arising from the operation. It consists essentially of a furnace with suitable means for heating it, having a grated floor or hearth, with means for discharging the burnt material after destructive distillation, a chamber situated above the furnace heated therefrom and adapted to receive the garbage or material, said chamber serving to dry out the material, after which it is discharged by gravitation through suitable gates or openings into the furnace beneath, the clinkers and ashes being eventually discharged through the hearth of the furnace into ash pits, from which it may be recovered. The vapors produced in both the drying chamber and the furnace are led through discharge pipes with suitable draught apparatus, by which they are carried through a series of condensers, and any gases which will not condense are returned and pass through the furnace, where they will be finally consumed. The only discharge after passing through the condensers will be air which has passed through the furnace to supply combustion, and a small amount of odorless, watery vapor.

PROPELLER.—Frederick Wittram, San Francisco. No. 573,562. Dated Dec. 22, 1896. This invention relates to improvements to be applied to propellers for vessels and other similar purposes. It consists essentially in a novel construction of the propeller blade, having corrugations decreasing in depth transversely from the front to the rear edge of the blade, so that the valleys thus formed serve to gather and concentrate the water through which the propeller is moving and discharge it from the rear edge to the blade. This construction also greatly strengthens the propeller and enables it to resist the strains which are naturally brought upon it.

TRACTION ENGINE AND HARVESTER ATTACHMENT.—Benjamin Holt, Stockton, Cal. No. 573,593. Dated Dec. 22, 1896. The object of this invention is to provide certain improvements in traction engines and harvesters, and especially in the means for connecting the engine and the harvester with an intermediate supplemental engine, by which the harvester mechanism is driven independent of the traction engine, and by which the supplemental engine and the harvester are allowed to turn upon the coupling with relation to the traction engine without throwing the connecting driving parts out of line. This is effected by a series of swivel joints, which allow the power of the supplemental engine to be applied to driving the cutting and threshing mechanism, the steam to this engine being supplied directly from the main traction engine boiler while the traction engine itself has only to draw the machine over the ground. In conjunction with this engine there are employed supplemental removable wheels and wheel frames journaled outside of the main bearing wheels of the engine and sprocket wheels and chains by which both main and supplemental bearing wheels are driven directly from the engine, while in front of the steering wheel is a supplemental roller which serves as a bearing for the front end of the machine. The supplemental wheels and roller act particularly upon soft ground, where the weight of the engine would sink it and make it useless under ordinary circumstances.

THE OVERLAND LIMITED,
VIA
UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

Assessment Notices.

CON. CALIFORNIA AND VIRGINIA MINING Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of December, 1896, an assessment (No. 7), of 25 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 4th day of February, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 29, Nevada Block, No. 309 Montgomery street, San Francisco, California.

HALE & NORCROSS SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 8th day of December, 1896, an assessment (No. 110) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 3, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 11th day of January, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 1st day of February, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

R. U. COLLINS, Secretary.

Office—Room 3, Stock Exchange building, No. 331 Pine street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 14 h day of December, 1896, an assessment (No 80) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of January, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 9th day of February, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada Block, 309 Montgomery St., San Francisco, California.

HARTMANN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Chili Gulch Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of December, 1896, an assessment (No. 1) of 5 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 46, No. 4 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of February, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 23d day of February, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

G. W. PEER, Secretary.

Office—Room 46, No. 4 Montgomery street, San Francisco, California.

MINERAL HILL MINING AND SMELTING CO.—Location of principal place of business, San Francisco, California; location of works, Spenceville, Nevada County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of January, 1897, an assessment (No. 1) of five cents (5c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 210 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 25th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

AND PACIFIC ELECTRICAL REVIEW.

No. 1906.—VOLUME LXXIV. Number 3. SAN FRANCISCO, SATURDAY, JANUARY 16, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Electric Street Car Motors.

On this page appear illustrations of some late devices in electrical street railway motors, as built by the Walker Co. of Cleveland, Ohio. Fig. 1 is of a spring-mounted motor rated at 30 H. P., capable of twenty miles an hour on a level track, and when running on a 33″ wheel at ten miles an hour exerts a draw-bar pull of 1000 pounds. Fig. 2 represents a 125 H. P. street railway motor. Armature winding is illustrated in Figs. 3, 4 and 5; the latter shows the armature of the barrel type; ordinarily such a winding signifies a longer armature; this particular style is so constructed that it is the same length as the old type of armature that connects its conductors across the ends. In Fig. 5 is shown an ingenious device for the protection of the ends of the armature; the surface of the armature on a radial line, even with the bottom of the slots, is produced, forming a part of the cast iron end piece, which is therefore a short cylinder. The end of this cylinder is flared outward, thus forming an iron-clad pocket protecting the ends of the coils. The other end is protected in a similar way, except that the flaring of the end piece is omitted, the ends of the commutator lugs performing that service. Fig. 6 shows the bad effect on the rail joints of the rigid style of motor, which is obviated by connecting the axle of the car by two space bars so placed that the center of the motor is always the same distance from the center of the axle, thus keeping the gears in mesh.

Coast Industrial Notes; Obituary; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations, 54. Rainfall and Temperature; Commercial Paragraphs, 63.

The Mining Bureau and a Geological Survey.

The Executive Committee of the California Miners' Association has sent letters to the members of the Legislature taking ground against the suggestion of the Governor, made in his message, that the State Mining Bureau be turned over to the University of California. They maintain that the Bureau should be kept in San Francisco as a separate institution. In so far as they refer to the mining work of the Bureau and the maintenance in San Francisco of the museum, they are right and their suggestion should receive the support of all of the mining members of the Legislature, provided something is done to take the Bureau out of politics.

The present State Mineralogist, J. J. Crawford, in his annual report, has suggested that the mining and geological work of the Bureau be separated. In that report he goes on to say that the State has expended a great deal of money for a geological survey without receiving any returns. The geological work that has been done by the State under the auspices of the Mining Bureau and State Geologist under previous laws will, when the time comes for making a thorough geological survey of the State, be almost entirely thrown aside, and it has cost the State fully a quarter of a million dollars. Further comment on the geological work of the State Mining Bureau is hardly necessary.

As to the mining work, a little more can be said; yet the Bureau has done very little compared with what it might have done had it been managed without political interference. As it is, the Board of Directors have very little to say and the members look upon their appointments as nothing more than an empty honor. The State Mineralogist is appointed by the Governor. All of his deputies are chosen through political influence. As a result, since the Bureau was established a very small proportion of the employes have been fully competent for the work they have been appointed to carry out.

If it were not for the fact that in order to secure appropriations from the Legislature some showing had to be made, even less good work would have been done by the Bureau.

As to the Bureau itself, there is need for the kind of work that it could do, and it is not work of such a nature as could be done well by the purely scientific men connected with the University, excepting, of course, the making of a geological survey of the State.

Probably the main reason why Governor Budd has recommended the turning over of all work of the Mining Bureau to the Board of Regents of the University is that he knows that no public body in this State at present would more honestly and conscientiously carry out any trust imposed upon them. However, it seems that it would have been wiser for him to have suggested that the Legislature provide for the appointment of a Board of Directors of the Mining Bureau, each member to hold office for a long time, and give them the power to choose the State Mineralogist and all his assistants, and be entirely responsible for the work of the institution. In other words, a body similarly constituted and with similar powers in relation to their trust as the Board of Regents of the State University.

The members of the Board of Directors of the Mining Bureau have very little responsibility, pay very little attention to the Bureau, and leave the management largely to the State Mineralogist and the politicians he has been compelled to appoint. It is true that the law provides that the State Mineralogist shall appoint competent assistants, but the very manner of his appointment precludes the possibility of his having freedom of choice in this matter. The present State Mineralogist has, to a certain extent, been allowed more latitude than some of his predecessors, and as a result has chosen some exceptionally good men and done good work.

But the system is vicious and the mining men in the Legislature owe it to their industry to see that a change is brought about, so that the Bureau will have some other excuse for asking for an appropriation than the personal appeal of place hunters.

The miners of this State ask very little of the taxpayers and have done more than any other class for the welfare of the commonwealth. What they would ask for the Mining Bureau should be willingly granted if they would at the same time see that a law is framed for its expenditure in a way that will yield good results.

It seems that the recommendation that the geological work of this State be turned over to the State University could not be opposed upon any sensible or reasonable grounds. In the first place let us take the question of cost. The University could undertake to carry out better work with an appropriation of $10,000 a year than could the Mining Bureau with an appropriation of $30,000 a year, even if the Mining Bureau had the required laboratories, libraries and instruments—which it has not. These would cause an additional original outlay of many thousands of dollars. If the work is turned over to the University there would be immediately available the magnificent chemical, mineralogical and other laboratories, which are equal to the best in the country, the best mineral collection and the best library west of New York. More than that, there would be available the services of one of the best corps of geologists, chemists and mineralogists, petrographers and paleontologists in the country. Other men would have to be employed by the Regents, but most of the assistance would come from younger scientists who, in connection with the University, would serve for less than half what the Mining Bureau would have to pay in salaries. Many of them, thoroughly competent young men, would serve for merely nominal salaries.

Then the work would be done upon a system that would be followed out for years and not subject to change, as has all of the work done by State institutions subject to political influence. More than that, the State could not find as competent men outside of the University for geological work.

The value of a geological survey of the State has not been appreciated because the right kind of work has not been done. That which would be of most value and which would have to be conducted by specially trained scientific men is such as has been done in other States in making investigations of particular subjects, such as building stones, mineral springs, oil wells, asphaltum, borax. For example: A good geological survey made in the Randsburg district might save many thousands of dollars wasted in boring for water in places where proper investigation might show it could not exist.

Let the mining members of the Legislature frame a law to take the Mining Bureau out of politics and turn over the work of making a geological survey to the State's fine corps of geologists at Berkeley.

Shall the Debris Question be Reconsidered?

It would seem now that the time is ripe for a reconsideration of the old debris question. Most of the strong passions and prejudices have died out, and there seems no reason why the men of the valley should not co-operate with those in the mountains and foothills for their mutual benefit. It was always contended by the hydraulic miners that they could be held responsible for but a small proportion of the damage that was done; yet, when the case was decided against them and against what they believed to be right, they submitted gracefully.

In the issue of the MINING AND SCIENTIFIC PRESS of Jan. 9th there was published an article on the "Responsibility for the Debris," and in this issue an article on the "Amount of Loss to California Due to Closure of the Hydraulic Mines." Next week this will be followed by something as to the amount of damage caused by the debris now in the Sacramento valley. The data for these articles is taken largely from reports prepared by the Government and by the anti-debris people in their own behalf, and the only people who could reasonably take exception to them are the hydraulic miners themselves.

The first article shows that of all the debris now resting in the Sacramento drainage system, not over one-fifth could possibly have been sent down by the hydraulic mines. More than that, since the closing of hydraulic mines the increase of erosion, caused by the settling up of the foothills and mountains, makes the present amount of debris coming in the Sacramento drainage system nearly as great as it was before the closing down of the mines. In other words, as much evil is being done by debris now as in 1880. The article in this issue shows that the closing down of hydraulic mines caused a loss to the State of over two hundred million dollars. Next week it will be shown that the loss to the farmers of the Sacramento drainage system is small compared with this.

Now the question arises, Cannot the Federal Government, responsible for the navigation of the Sacramento river, the State, the farmers and the miners, co-operate under some system by which all may be benefited?

There have been many suggestions made by the parties interested and the engineers who have examined the case as to what shall be done. The expenditure of large sums for impounding dams is doing very little good, and can do very little good. Some other remedy must be adopted.

The Miners and the Funding Bill.

If the defeat of the Funding Bill in Congress is going to result in a change of ownership in the Central Pacific, and consequently more competition, whoever the owners may be, it is almost certain to lead to great good to the mines of this State and give an impetus to that industry in all its branches. The Southern Pacific Company, while alone here in the field, has done nothing toward developing new districts, but wherever it has come into competition in the southern part of the State it has done much more building of branch lines in order to secure the trade. This is well illustrated in the case of the Randsburg district. There is more need for a railroad, and more business for one, in many of the mining districts along the Sierras than at Randsburg, and if there had been two roads competing for the trade of the mines many branches would have been built long before this, and they would have given a greater impetus to mining than anything else. Capitalists do not care to travel far beyond Pullman cars.

Down at Randsburg, because it has a rival, the Southern Pacific hastens to consider the feasibility of building a branch from Mohave in order to secure that trade. If it were not for the competition of the Santa Fe, the Southern Pacific's nephew and mining engineers would never have taken the trouble to go to Randsburg. In Colorado, where there is competition, branch roads are built into all the mining districts as soon as it is determined that there are good mines. The result has been of great advantage to Colorado in the development of her immense mineral resources, not only of silver and gold, but of iron and coal. Let a competing railroad come into California and then we shall see the Southern Pacific hasten to build branches in order to secure its share of the business.

Concentrates.

TWENTY men are working dry placers in the new district in the Chimehuevas mountains, Arizona.

THE Mercur mine at Mercur, Utah, has made several shipments of ore to be cyanided in Germany.

SANTA CRUZ, CAL., reports the discovery of a quartz ledge in Gold gulch, near Felton, that assays well.

IT is claimed that there are large quantities of good asbestos to be found near Hamburg Bar, in Siskiyou county.

THERE is considerable excitement in Wadsworth, Nevada, over discoveries of paying placer ground in Olinghouse canyon.

IT is said that nearly $10,000 was taken from Canyon mountain, in southern Oregon, during last season by pocket hunters.

ONE business house in Grants Pass, Oregon, recently made a shipment of $15,000 in gold from the placers in the neighborhood.

LEDGES of gold-bearing rock have been uncovered near Glenbrook, Nevada, and have caused considerable excitement.

THE payrolls of the Comstock mines for December footed up a total of $58,368.91, a falling off of over $7000 from the preceding month.

THE Standard mine in the Cœur d'Alene, Idaho, produced last year 10,719 tons of concentrates and crude ore valued at $797,998.17.

THE mining men who are interested in the country adjacent to Kramer, San Bernardino Co., have organized Kramer mining district.

THE Bellefontaine Mining Company of Grass Valley, Cal., have decided to sell enough treasury stock to pay for the erection of a mill.

THE city council of Vancouver, B. C., is considering the question of offering a bonus for the establishment of a smelter at that point.

ARIZONA has a wise law which will not allow the relocating of claims to avoid assessment work and compels locators to do development work.

REPORTS come from Juneau, Alaska, of the discovery of quartz ledges under houses and cabins in the town that have been occupied for years.

AN English syndicate has made an offer of $500,000 for Deer Park mine, at Rossland, B. C., and a meeting of shareholders has been called to consider it.

THE report of the Canadian collector of customs at Rossland shows an increase in collections from $5982.95 in January, 1896, to $12,629.20 in December.

BRITISH COLUMBIA papers claim that there are fifteen mines in the Slocan country whose monthly shipments will aggregate 4000 tons of ore during the year.

AT the time the Randsburg mining district in Kern county was formed years ago 33 votes were cast. Last week 611 votes were cast in an election for Recorder.

THE number of mine leases in Colorado reported by the State Mining Bureau for 1896 was 406; the number of acres leased, 14,310, and the yearly royalties $1940.

EASTERN capitalists who have purchased a large tract of placer ground in the Sweetwater valley, Wyoming, propose to convey the water for hydraulicking by pipe a distance of twenty miles.

CAPT. J. R. DE LA MAR has obtained an option on the Mercur mine in Utah for $1,500,000. This mine has been sought after by foreign capitalists for some time. It has paid in dividends $575,000.

THE new hoisting plant at the Le Roi mine, at Rossland, B. C., is the largest in any metal mine in Canada. It will be running in thirty days and the output will then be increased to 500 tons per day.

THE Calumet & Hecla Mining Company have declared dividends amounting to $48,350,000. Last Monday a dividend of $5 and an extra of $10 were declared, the largest in the history of the company.

A FRENCH syndicate has made an agreement for the purchase for $150,000 of a group of mines in the Sum Dum district in Alaska from W. F. Mills. The claims are on the northern shore of Holkam bay.

DURING the last seven months of 1896 the business of the Cripple Creek Stock Exchange gradually increased from $106,437 in June to $227,675 in December. The total was, for seven months, $1,301,865.

THE projectors of the Sierra Pacific railroad, to run from Stockton into Amador and Calaveras counties, Cal., have been into Tuolumne county to look over the ground, with a view to running a branch up there.

IN the Lady Washington mine, Tuolumne county, under bond to McGillivray & Meek of San Francisco, in the development work good ore has been encountered and arrangements are being made for the erection of a 10 or 20-stamp mill.

THE negotiations for the purchase of the Tomboy at Telluride, Colorado, have been concluded and the property passes into the hands of the Exploration Company of London, for $1,500,000. The deal was managed by Henry Bratnober.

LAST Thursday in the United States Senate a resolution by Senator Stewart of Nevada was agreed to instructing the Committee on Mines and Mining to report on the best means of securing complete statistics of the output of American mines.

THE smelters of Pueblo, Colorado, did a larger business in precious metals in 1896 than any previous year, amounting, according to the *Chieftain*, to $15,443,084. And this was in spite of the fact that the production of lead was worth less in 1896 than in 1892.

IF the recent discovery of petroleum in Cochise county, Arizona, turns out to be of value, it will afford cheap fuel for the reduction of gold and silver ores in that country. In regions where wood is worth from $6 to $8 per cord, such a discovery is not to be undervalued.

B. A. CARDWELL of Salt Lake has bonded two more mines in Meadow Lake valley, the Belle and Joana, from J. Adolph, for $10,000 each. This makes nineteen mines that he has bonded for his company. It is their intention to build a road from Truckee in the spring.

THE new town of Johannesburg has been started near Randsburg by several Los Angeles people, who have formed the Johannesburg Water and Milling Company and have secured a section of land. They are boring for water and propose to erect a 30-stamp mill.

THE Union Pacific Railway is attempting to obtain patents to mineral lands within their grants in the Crown mining district near Cheyenne, Wyo. Protests have been filed with the local land office against issuing patents for fourteen sections, or 8890 acres, in the district.

FOR several months eighty or ninety oil wells at Summerfield, Santa Barbara county, Cal., are reported to have been pumping regularly and shipments of about three carloads a day have been made. The strike of oil made in a tunnel near the town has stimulated the boring of new holes.

THE owners of the Virginia mine and the Revenue tunnel near Ouray, Colorado, have engaged 400 to 600 miners around Joplin, Mo., to take the places of the strikers. It is believed the importation of non-union labor will cause a general strike of union miners in Ouray and San Miguel counties, who number about 2500.

AT the Helena & Frisco mine in Idaho, in which the Exploration Company have lately purchased a controlling interest, several improvements are contemplated, including a Corliss hoisting engine that will be heavy enough to operate the mine to a depth of 3000 feet. A large addition will also be made to the mill.

IT is reported that the North American Exploration Co., composed of Paris and New York capitalists, have obtained an option on most of the stock of the Mammoth mine in Utah at the rate of $2,000,000. The Mammoth has paid dividends amounting to $1,150,000 and the workings have reached a depth of 1600 feet.

UNDER the Enabling act Montana was given 100,000 acres of land for the establishment and maintenance of a School of Mines. The Legislature having made appropriations for a building, the cornerstone was laid at Butte last month. Among the articles placed in the receptacle was a copy of the MINING AND SCIENTIFIC PRESS.

THE Salt Lake *Tribune* states that Colonel H. G. Heffron, who, while superintendent of the Niagara, commenced a series of experiments by which it was demonstrated that the low-grade gold ores of Bingham could be profitably handled by the cyanide process, has decided to go upon the mother lode in California in a short time.

THE miners in the Mojave district propose to ask that a new county be created, to consist of the northeast corner of Los Angeles county, including Lancaster and Antelope valley, extending northward into Kern county, to include Mojave and the Randsburg mining district and taking in all the desert country now in San Bernardino county, Cal.

AT the Comet mine on Berners bay the ledge has been cut at a depth of 1000 feet and it is said that it has been found to continue down in size and value. This will be of importance to the mining industry of Alaska. Heretofore few ledges have been worked to much depth and it has been mere conjecture as to whether they would pay in depth.

THE Colorado State Bureau of Mines examines into and reports upon all casualties occurring in mines. The number of deaths in six months ending November 30th last was 154 and the cases of injury 162. Of the deaths 39 were caused by fall-material, 25 by men falling and 49 by explosives. The total number employed in the mines is reported as 25,545.

THE mines of the Juneau Company in Alaska, owned by Charles D. Lane and Archibald Campbell are under investigation by Capt. Thomas Mein, for English capitalists, with a view to purchase for $350,000. The mines are located in the Silver Bow basin, on the mainland, three miles from the Treadwell mines. A 30-stamp mill is in operation on the property.

A TELEGRAM has come from Denver to the effect that there is a report that there is about to be formed a combine between the smelters of the State on one hand and the cyanide and chlorination mills on the other. This is to be for mutual benefit and it will increase the price for treating ores of all grades. A uniform advance of $2 per ton is said to have been agreed upon.

IN the California Legislature during the week Assemblyman Caminetti introduced a joint resolution instructing the California delegation at Washington to use all honorable means to secure the passage of the mineral lands bill now pending in Congress. Under a suspension of the rules the resolution was unanimously adopted and ordered transmitted to the Senate.

ACCORDING to the Nelson, B. C., *Tribune* the mineral export of West Kootenay through Nelson for 1896 may be safely set down as having slightly passed the $3,500,000 mark. Much of the ore that goes out of the Slocan is not entered in the customs at Nelson, but at Revelstoke, so that the returns from the port of Nelson represent but a portion of the mineral output of the district.

BEFORE the House Committee on Ways and Means last week, in Washington, representatives of smelters asked for lower rates on lead ore, claiming that the importation of lead ore was necessary for smelting, and under an erroneous interpretation of the present law it paid as high rates as 5 and 5½ cents per pound. Duties of 1¼ cents on lead bullion and 1⅜ cents on pig lead were asked.

ACCORDING to a law of the State of South Dakota every corporation must make an annual public statement of its affairs through an advertisement in a newspaper, but so far this has been a dead letter, just as are most laws in this State of the same nature. As an English member of Parliament, who had spent many years in America, said, there are splendid laws in the country but they are not enforced.

THERE is a project on foot to build a railroad line from Spokane northwest through Stevens county and the Colville Indian reservation to Grand Forks, 140 miles, and in British Columbia. It is proposed by those who have sent the engineer in the field to construct an electric line from Spokane to Kettle Falls, a distance of 110 miles, operating it by the power to be derived from the falls at Spokane.

DURING the week the new Mining Stock Exchange at Spokane began business. If properly managed the exchange may do considerable good, especially by discountenancing wildcats. Spokane is the natural business center of a large mining country, including most of the great districts west of Montana. A great majority of the stocks listed on the new exchange are of mines in Trail Creek, Slocan and other British Columbia camps.

THE Exploration Company of London, it is understood, will decline to take the Champion mine at Grass Valley at the price asked for it. The English or French syndicate, in purchasing California mines that are well developed and paying dividends, labor under a disadvantage. The commissions and promotion fees are so large that properties must be purchased at considerably less than their real value in order to float in London without over-capitalization.

F. E. WARD has advertised that he will make an application to the legislative assembly of British Columbia to construct and operate a railway from a point at or near Ashcroft or Kamloops to Barkerville, in the Cariboo country. Last winter A. D. Whittier made an application to operate traction engines from Ashcroft to the mines. A petition signed by about 300 residents of that country against the scheme killed its passage. The greatest opposition came from the freighters.

THERE is apt to be soon considerable litigation as to rights to veins caused by the running of the large drainage and prospecting tunnels in Colorado. The tunnel owners claim to be the owners of veins which have already been opened up in patented territory, if the tunnels were located prior to the discovery of the veins in question and have been worked continuously with due diligence. A tunnel site runs for a distance of 3000 feet and claims 1500 feet on every vein cut in the course of the tunnel.

FROM nearly all the districts on the Pacific coast in which hydraulic mining is being done come reports of increased activity, and many new plants have been or are being fitted up. In Oregon, Idaho, Nevada, Wyoming and Colorado there have been more new mines partially or fully fitted up for this season's work than ever before. Generally, the indications for a good season's supply of water are excellent. The importance of this should not be overlooked, for it promises to do much toward increasing the gold yield of 1897.

THE fact that in all the mining districts of the West there has been a greater increase in the output of gold than in other parts of the world during the past year and that, too, in spite of the fact that millions have been poured into the foreign mines from Europe and very little has come to this country, is apt to make European investors seriously reflect whether, after all, this is not their best field. If this leads to a greater demand for western American mines, it is to be hoped that the papers of this country will do their share toward preventing wild speculation.

A RAILROAD and water route into the Yukon country is projected by Canadians. A report upon the feasibility of the plan has been made and submitted to the Dominion Government, in which it is stated that the best route would be by Lake Teslin and down the Hootalinqua to Fort Cudahy. This, it is claimed, is practicable, and navigation is open from the head of Lake Teslin to the mouth of the Yukon in summer. A light railway, it is claimed, could be built from the Stikeen river, at the head of navigation, about 120 to 190 miles long, which could be operated most of the year. The cost of this is estimated at $3,500,000. It is claimed that good coal can be found along the line of the road.

A SYNDICATE of Eastern capitalists at the head of which is Ex-Governor Pattison of Pennsylvania, has obtained options on 1600 acres of gold mining properties in the Black Hills, South Dakota. The corporation called the Edgemont and Union Hill Smelting Company will take over the Union Hill and other properties acquired. There have been made already arrangements for the erection of a smelter at Edgemont and a 400-ton stamp mill at Union Hill. The output of gold from the Black Hills last year showed an increase of about 25 per cent over 1895, and with the influx of Eastern capital and the new discoveries at Ragged Top and other points there is every promise of a still further increase for 1897.

OF the output of 1896 the Rossland, B. C., *Miner* says that, owing to inadequate transportation facilities, the output of the camp was comparatively light until within the last few months, and even now the second railroad has only begun to take ore away. Despite this fact, at the end of 1896 nearly 40,000 tons of ore have been marketed, as follows: Le Roi, 27,665 tons; War Eagle, 10,000 tons; Iron Mask, 705 tons; Poorman, 340 tons; Josie, 574 tons; Crown Point, 150 tons; Mayflower, 100 tons; Cliff, 75 tons; Evening Star, 25 tons, and other smaller shipments amounting to about 50 tons. The average value of the ore per ton was close to $40. At $35 per ton, it makes the production for the year worth $1,400,000.

REPRESENTATIVE HERMANN of Oregon, before the House Committee on Ways and Means last week, advocated a duty of 10 cents per pound on nickel. He spoke of the resolution of Congress passed in 1891 authorizing the Secretary of the Navy to contract for the purchase of $1,000,000 worth of nickel for armor plate on the assumption that it could not be produced in the United States. Since that time ores had been discovered in various parts of the United States—in Nevada, bearing 15 per cent; in Jackson county, N. C., and Fremont county, Col., bearing 12 to 14 per cent; in Saline county, Ark., and in Washington and Oregon, where there was a mountain of ore. Oregon producers claimed to be able to produce nickel at 4 cents a pound cheaper than the Canadians.

A DISPATCH from New York appears in a Philadelphia paper to the effect that an investment company has been organized in London, in which the Rothschilds are understood to be interested, for the purpose of changing the direction of investments which have been toward the South African mining fields, to the United States. Some of the agents, it says, of that company are now in this country, and others who have recently been here are in London reporting the results of their visits to many of the mining tracts of the West and one or two in the South. The feeling in London was that investment in South African mining has been greatly overdone and speculation had unreasonably increased prices of a large number of mining stocks. Probably the forthcoming reports of the yield of the American gold fields, compared with those of other countries, will do more to turn English capital this way than anything else.

Amount of Loss to California Due to Closure of the Hydraulic Mines.

The losses growing out of the closure of the hydraulic mines are difficult to estimate. They have been:

First—The direct loss of the gold produced by the mines.

Second—The depreciation in value of the property and equipment of the industry to almost nothing.

Third—The loss to sympathetic industries, among them agriculture.

1. *Direct Loss of the Gold Produced by the Mines.*—Statistics bearing on any special branch of gold mining in the State are very meager, and even the amount of loss from closed mines would not represent the real loss, for there are mines which might have started had not the industry been checked. In this regard, however, it is contended by many prominent men in the industry that a large number of the mines were running upon very narrow margins of profit and that this particular form of mining had in the region under discussion reached its highest point. The most valuable gravels were fast being worked out and many propositions had been started in uncertain places. An increase in production would necessitate an increase in water facilities, and in some regions the available water was already in use. The presence of public water upon most divides made it possible to work with but little capital, and hardly a deposit exists that had not at some period been worked more or less. A continuance of mining would cause constant increase in cost per cubic yard, because as the miner washed back from his dump the amount of valueless gravel and lava to be removed increased and the length of sluices, ditches and tunnels increased; therefore the cost gradually approached the value of the gravel until, passing it, the deposit could be no longer worked.

The amount of gravel remaining that may be worked has been partially estimated by the United States Corps of Engineers* at 836,500,000 cubic yards, contingent to the Sacramento river, which at the rate of annual washings given in the last issue of the MINING AND SCIENTIFIC PRESS should be enough to last for eighteen years.

It may be safely assumed that were the mines to start up to-day, unrestricted, neither the tailings discharged nor the gold produced would exceed that of 1880. But the industry would probably maintain this status for many years to come. It is currently stated that the gold produced from the hydraulic mines was nearly $10,000,000 per year; but the facts do not warrant such an estimate.

The following table of county productions indicates the decrease in gold production in the regions affected by law:

TOTAL GOLD PRODUCTION.

Counties—	*1880.*	*1883.*	*1885.*	*1891.*
Amador	$1,507,047	$1,590,000	$2,145,591	$1,395,962
Butte	450,000	630,000	672,568	304,765
Calaveras	580,000	500,000	427,538	738,883
El Dorado	611,000	530,000	418,833	173,279
Fresno	72,000	100,000	74,000	82,607
Mariposa	322,000	220,000	89,000	84,414
Nevada	2,850,000	3,000,000	2,577,373	2,207,887
Placer	1,025,000	810,000	906,301	998,494
Plumas	1,068,839	950,000	840 307	482,462
Sacramento	75,000	490,000	353,522	142,830
Shasta	546,833	210,000	417,004	554,063
Sierra	990,000	1,075,000	1,433,880	701,702
Stanislaus	100,000	40,000	18,000	3,000
Tuolumne	689,599	320,000	310,903	1,384,950
Yuba	1,042,340	455,000	207,448	37,576
Totals	$11,929,658†	$10,910,000‡	$10,892,768‡	$9,292,874‡

Kern, Tulare and some counties partly affected, whose combined production is less than $50,000, have been omitted.

It will be seen that the total production of gold in the region affected by law decreased about $1,000,000 from 1880 to 1885—that is, before and after closing. But if we take Yuba, Placer and Plumas counties alone, the decrease in them was over $1,000,000.

It must be remembered that miners thrown out of employment in the hydraulic mines did not remain idle, but immediately turned their attention to the other branches of the industry. The new impetus given to the other branches of mining immediately began to cover the loss by the closure of the hydraulic mines. The following tables from the tenth and eleventh censuses show the production from quartz and placer mining separately, before the debris litigation and after, and more clearly show the production of the hydraulic mines and the impetus given to quartz mining as well:

	1879-1880.‡		1889.	
Counties—	*Deep Mines.*	*Placer Mines.*	*Deep Mines.*	*Placer Mines.*
Amador	$1,407,047	$100,000	$905,804	$2,422
Butte	.....	450,000	52,261	248,380
Calaveras	435,000	145,000	635,089	91,172
El Dorado	96,881	541,268	77,289	103,414
Mariposa	322,374	.....	16,269	3,785
Nevada	1,100,000	1,750,000	1,715,248	293,331
Placer	175,000	850,000	748,121	462,031
Plumas	820,255	248,584	407,793	91,284
Sacramento	.....	75,000	.....	166,000
Shasta	96,401	450,432	259,316	2,080
Sierra	330,000	600,000	319,452	1,007,834
Stanislaus	.....	100,000	.....	15,955
Tuolumne	129,771	559,826	167,789	44,985
Yuba	.....	1,042,349	5,875	92,498
Totals	$4,912,629	$6,914,459	$5,310,306	$2,535,191

The decrease of placer gold during the period shown by this table has been $4,379,268. Not all of the placer gold was produced from hydraulic mines, and the impetus given drift mining by the closing of the hydraulic mines obscures the true difference. There has also been a certain decrease in the amount of stream gold produced from the seemingly exhausted placers, but the amount is inconsequential. By inspection of individual drift mine records and the list of additional producers it seems that there has been an increase in drift production of about $1,000,000 per year during the period. Therefore, the decrease which would be shown in placer gold had there been no increase in drift production is obscured to the amount of $1,000,000, or the real loss from closing the hydraulic mines is nearly $5,300,000. Had the hydraulic mines been allowed to proceed from 1882 to 1896, as before, California would have produced nearly $72,000,000 more in gold than she has.

2. *The Depreciation in Value of the Property and Equipment of the Industry.*—The property of the hydraulic miner consists mainly of a gravel deposit, water facilities and equipment for mining. It is impossible to estimate the depreciation in the value of the gravel deposits. Few have been sold and these for less than 10% of their former valuation. There is no demand for unworkable mines at any price, and those transferred have been so because they have offered facilities for storage of tailings or for other purposes. There is no way of determining their former value.

In regard to water rights and water installation, slightly more tangible material is at hand. The eleventh census shows 5225 miles of ditches in the area affected by debris litigation, and the average cost of the ditches of which data were obtainable is shown to be $3800 per mile, including reservoirs. This would indicate an investment of nearly $20,000,000, but the water rights and privileges were worth much in addition to the actual cash invested. These ditches in some cases have been turned to other uses, such as irrigation, power, etc., so that they are not a total loss. Others have been abandoned altogether and allowed to go to ruin.

The equipment of the mines in pipes, flumes, tunnels, bedrock ditches, machinery, etc., being unused has gradually gone to ruin. Of five large companies about 30% of the money invested was in water equipment, and the balance in mine equipment, property and working capital. This ratio would show an invested capital of about $66,000,000—$100,000,000 is the amount usually estimated to be invested in the industry. It is safe to say that with no relief in ten years time this amount would depreciate fully 90%.

3. *Loss to Sympathetic Industries.*—The sympathetic industries to hydraulic mining are of every description. Of the $5,300,000 annually produced from the mines a large portion went for supplies, labor, etc., and the direct loss to sympathetic industries is largely included in the loss of gold to the State, or the $72,000,000 before estimated. But the depreciation of the property of these sympathetic industries has gone with the depreciation of the mine values. Enterprises contingent on the mines have become valueless and their property gone to ruin. Everywhere throughout the region houses and shops and in some places whole towns have been abandoned and become valueless. Among the enterprises to suffer most are the farms themselves, for where a ready market was once afforded there is no market at all for the products, and the very people who have brought the industry to its present condition suffer with it.

The assessment rolls of the counties along the foot of the mountains show a depreciation of real estate values greater than the general depression is accountable for. This loss is again impossible to even estimate. If we suppose that the amount of money paid for supplies annually by the miners to the persons who furnished these supplies to be 10% upon the money they had invested in order to produce them, we may get an approximate idea of what this loss amounts to. In table 49 of Bowie's Hydraulic Mining it will be seen that the operating expenses of a number of mines were from 30% to 65% of the gross yield, with an average of about 47½%. This 47½% of the annual yield of $5,300,000 would be $2,517,500 disbursed for labor and supplies. By the averages given this amount would be distributed about as follows: Labor, $1,359,300; supplies, $1,158,200. This amount of disbursement does not include the disbursements for installation or additions to plant, but simply for operating expenses. Probably 90% of that disbursed for labor was in turn disbursed for supplies to miners, or $1,223,370, making a total of about $2,380,000 annually disbursed to people not directly in the industry, and not including the disbursements that have been made in investing $100,000,000 capital in the industry. Since closing the mines this annual disbursement would have aggregated $35,700,000. If this annual disbursement paid to the owners of the enterprises furnishing the supplies represented 10% of the capital invested, the capital contingent to mining would be $23,800,000, or at 5% only, then it would be $47,600,000. Such enterprises are not usually dependent entirely upon one class of customers, but nevertheless the decrease in business affects the owners almost as keenly. This estimate does not include the capital invested in foundries and enterprises which furnish supplies for installation, or for labor occupied in building ditches, etc. The total capital affected may be therefore estimated at $50,000,000, which, added to the $100,000,000 directly in the industry, would approximate $150,000,000 of capital depreciated almost to nothing from closing the mines, or a loss to date of capital and income of upwards of $225,000,000.

Of the supplies used by the mines and miners a large proportion, probably half, come from the farms, or upwards of $1,500,000 yearly, the loss of which trade has added to the general agricultural depression.

* Report on Mining Debris in California Rivers, by Lieut.-Col. G. H. Mendall, p. 35.

† Tenth census fiscal year ending June 30.

‡ Director United States mint.

‡ No account is taken in either table of the silver included in these amounts, for it is proportionally inconsequential between placer and quartz gold.

Nevada City District Geology.

NUMBER VI.

The contact vein lies to the west of the Merrifield, and its southerly part is parallel to it in strike and dip. It is first seen at the Providence mine, where a rich pay shoot has been opened on it. It is also extensively worked on the Champion ground, as well as at the old and new Nevada City shafts. Near the latter it turns rather suddenly, without break, to a west-northwest direction, running across the Chapman ranch. The vein exposed in the Coan mine is probably the same, but it cannot be traced farther than this. It has not been opened extensively to the west of the Nevada City mine. Practically the whole southerly part of the vein lies on the contact between granodiorite and slate. About 500 feet south of the Nevada City new shaft it leaves the contact and enters the granodiorite. It is usually a wide vein, heavily sulphureted—even more so than the Merrifield — carries considerable silver, and shows abundantly the same indications of an extensive overthrust fault fissure, the throw of which must be larger than that of the Merrifield. A very short distance south of the Providence ore shoot it runs into a diabase (exposed on the sixth level) and slate, and closes down to a mere seam. The fissure has a strong tendency to throw out stringers and fissure in the slate foot wall; these have generally a flatter dip than the main fissure. Several such veins and stringers are seen in the Providence mine. A shaft near the Wyoming mill has been sunk on such a vein, which is found to unite with the contact vein. The northerly Wyoming shaft is sunk 900 feet on the incline on a slate vein, which may or may not be the same as that exposed near the mill, and which in depth will probably be found to unite with the contact vein, as it does on the strike near the old Nevada City shaft. Between Indian Flat and Deer Creek the schists contain a great number of seams, mostly dipping southwest from 10° to 40°, and which are sometimes very rich in coarse gold. The hydraulic method has been used in places to wash the surface soil containing the decomposed seams. This locality is known as Red Hill. The Home and Cadmus mines are located on this seam belt, south of Deer Creek.

A short distance northwest of Coan's mine, outside of the area of the map, the contact metamorphosed slate runs out to a point. A little farther on the serpentine and pyroxenite also run out in a point in the diorite, leaving the granodiorite adjoined by a large area of darker, dioritic rock, sometimes containing pyroxene. The Ella or Oro Fino vein cuts across the granodiorite and diorite with a north-northwest strike and an easterly dip of 45°. The shaft is 300 feet deep. The Yellow Diamond has a northwest strike and lies in the chloritic and fine-grained dioritic rocks separating the serpentine from the coarser and more normal diorite. Still closer to the river, in diorite, but near the granodiorite, lie the heavy Ætna and Dement veins, both striking northwest and dipping east. While there is no one continuous and well-defined vein leading down to the South Yuba river from the Nevada City mine, it cannot be denied that there is a system of linked and interrupted veins extending in that direction. On the river, also, three-fourths of a mile above Jones' bar, the diorite and granodiorite are separated by a distinct fault fissure, with easterly dip and northwesterly strike, though at this point there is no quartz present.

In the northeastern part of the Grass Valley district veins more or less parallel with the Idaho east-and-west system predominate. The Spring Hill, Kentucky and Alpha are in serpentine or on the contact between serpentine and diabase dikes, and dip northward at a moderate angle. The Spring Hill is a very heavy vein, impregnated with fine-grained pyrites. The Coe mine is on a very heavy vein, in serpentine, also dipping north. The St John shows a heavy but irregular vein on the contact of serpentine and slate at the 500-foot level, as well as several seams, all dipping north at steep angles. There is evidence of an overthrust fault in this mine. The Crown Point has a vein in serpentine striking northwest and dipping north 75°. Most of the gold in this mine is very coarse.

The celebrated Eureka-Idaho vein is first seen 2000 feet north-northwest of the Maryland shaft, and forms here large, barren outcrops. Between the Maryland and Maslin shafts the vein does not show on the surface, but its continuation is clearly

shown underground. For some distance on each side of the latter shaft there are outcrops which are believed to be those of the Idaho vein. Beyond this the vein cannot be traced on the surface. The Idaho vein dips southward at angles ranging from 50° to 70°. On the Eureka ground it is in serpentine, with a diabase dike in the hanging wall; at the Maryland shaft it is between a serpentine foot wall and a gabbro hanging wall, and then enters the serpentine. Underground, however, most of the vein east of the Maryland shaft lies between a diabase hanging wall and a serpentine foot wall. The vein is remarkable for its strong, continuous ore shoot, dipping east at a moderate angle on the plane of the vein. The vein is 2 feet thick and carries about 1 per cent of iron pyrites, copper pyrites, and galena; the sulphurets contain from $100 to $175 per ton. The average value per ton has been about $28. The annual production of the vein has rarely fallen below $300,000. Attempts have been made to find the continuation of the Idaho vein in the Brunswick district at Chevanne tunnel, but thus far without success. In the southwest corner of the small Brunswick district there is a series of parallel veins, dipping south and striking northwest, which may be considered as belonging to the Idaho system. Of these the Brunswick, Gold Point, Union Hill, Lucky and Cambridge are the principal. All are contained in a schistose diabase tuff, and considerable work has been done on them in former years.

(To be Continued.)

The Solution and Precipitation of the Cyanide of Gold.*

NUMBER V.

By S. B. CHRISTY, Professor of Mining and Metallurgy, University of California, Berkeley, Cal.

It will be seen that Prof. de Wilde makes his cuprous salt in the solution itself, also acidifying the solution at the same time with sulphurous instead of sulphuric acid. This may appear an advantage; I think, however, that the mechanical difficulty of treating a large volume of solution with gas will more than offset the slightly greater cost of the sulphuric acid for the same purpose. However this may be, I prefer my method of making the cuprous salt outside of the stock-solution and from strong solutions, so that the application of the sulphurous acid may be more readily controlled and the production of the cuprous salt more complete. With these slight differences of detail, the methods are the same. Whether the method was first discovered in Belgium or in California is a mere matter of dates.

I have tried the method suggested by Prof. de Wilde, as well as my own, with solutions containing from only $3 to over $600 per ton of gold (from $\frac{1}{20000}$ of 1 per cent gold up to $\frac{1}{10}$ per cent gold), and I have found them both to remove the gold with a sharpness and completeness that is a great relief, after trying the other methods in use.

I find, however, that with Prof. de Wilde's method it is necessary to let the solution stand at least twelve hours before filtering, otherwise all the gold may not be precipitated. In fact, in some cases not the slightest trace of a precipitate will form for several hours, the liquor remaining clear as crystal. At last, however, it never fails to come down. Gently heating the solution hastens the reaction; cold retards it. At the ordinary temperature of the air (60° F.) heating is not necessary for the completion of the reaction, but more time must be then allowed. It is best, however, to allow the filtrate to stand for several hours, another twelve hours if possible, to be sure that no further precipitate comes down. This is where my method has the advantage; being formed in concentrated solutions, my cuprous salt is already reduced and the precipitate forms sooner. I think the reason for the delay in his method is the greater dilution of the copper salt and the sulphurous acid, which retards the formation of the cuprous salt.

I feel sure that this method in either of its forms will prove a valuable addition to our present means of recovering gold from cyanide solutions.

But before the advantages of this method can be duly appreciated it will be necessary to briefly consider the methods for precipitating gold at present in use. There are only two which have made any headway on a working scale, namely, the use of zinc shavings, as recommended by the MacArthur-Forrest people, and the use of electricity, as in the Siemens & Halske process. I shall consider them in inverse order.

6. *The Use of Electricity for Precipitaing Gold from Cyanide Solutions.*

The use of electricity for depositing gold and silver for electroplating has been practiced successfully for so many years that it would seem that this method would be a simple, expeditious and practical method of precipitating gold from the cyanide solutions obtained by leaching gold ores. But a little reflection will make it clear why so many processes for this purpose which have been patented have never been heard of since.

In electroplating it is possible and practicable to use: 1, soluble gold anodes, by which the counter-electromotive force of the precipitated metal is entirely neutralized; 2, concentrated solutions of the double cyanide of gold and potassium, so that the specific resistance of the solution is low; 3, an electrolyte of constant composition, whereby the proper working conditions may be constantly maintained after they have once been reached.

None of these conditions can be secured in precipitating the gold from a cyanide ore extration solution.

It is true that in the Siemens & Halske method a soluble anode of iron plate is used; but all the cyanogen that combines with the iron is lost, ferrous cyanide and finally Prussian blue being formed to no useful purpose. The principal difficulty, however, is one that cannot be obviated, viz., the high specific resistance of the dilute solutions that must be used. With solutions always containing less than 1 per cent, and sometimes less than 0.05 per cent, of free cyanide, and perhaps 0.001 per cent of gold, or less, the resistances are something enormous, and with any other metal than gold no one would think of precipitating such a solution with electricity. The high specific resistance of the solution may be met by using an increased surface of anode and cathode and by artificial circulation, but this can only be done at an outlay and with a complication which robs the method of its cheapness, simplicity and convenience.

My attention has just been called to a corroboration of these views in an article entitled "Zinc vs. Electricity," by Mr. John Yates, South African *Mining Journal*, September 26 and October 3, 1868, where an interesting comparison of these methods of precipitation is given.

It is true that electrolytic methods of precipitation are used in the analytical laboratory as convenient methods of analysis. But a long experience with these methods on a small scale has convinced me of the great difficulties which will always stand in the way of their application on a large scale. It is one thing to electroplate an article with gold in a strong solution of aurocyanide of potassium with a gold anode which constantly adds as much gold to a solution as is precipitated, and it is quite another to precipitate all the gold from a solution with an insoluble, or even an iron, anode when the solution contains perhaps 0.05 per cent of cyanide of potassium and perhaps 0.001 per cent of gold. Here the problem is to reduce the gold content to 0.00001 per cent (or from $6 to 6 cents per ton solution). Any one who has attempted this recovery (which is 99 per cent of the gold contained in solution), without at the same destroying most of the cyanide present, will agree with me that it is no easy task.

There is another difficulty that I have met with. Under certain circumstances the gold is precipitated not only on the cathode, but also on the anode; and, in addition, in many cases of the treatment of the solutions produced from ores a precipitate settles out from the electrolyte which also contains gold. The reason for the first difficulty seems to be that when the current decomposes the salt $KAuCy_2$, it decomposes it not into $K, Au+2Cy$, but the K alone goes to the cathode, while the acid radical, $AuCy_2$, goes to the anode. The deposition of gold which appears on the cathode is due to the metallic potassium attacking and reducing gold as a secondary reaction from the solution there adjacent. Great density of current and long treatment will finally throw out all the gold on the cathode, but there is enough force in this tendency to greatly retard the electro deposition of the gold.†

I have been able, by acidifying the solution with dilute sulphuric acid, to get fairly complete precipitation in a reasonable time, say, twelve to twenty-four hours, on a small scale, both with insoluble anodes (carbon, platinum or lead) and with soluble ones (zinc, iron or copper). Of course, in this case the cyanide is destroyed, unless special steps are taken to recover it. The precipitation is much more rapid and complete from these dilute gold solutions when the reaction is acid than when it is alkaline or neutral.

The difficulties which I have pointed out in the electrolytic method may be met by great technical skill, as has been the case in the Siemens & Halske process, and in that way, when they are reduced to a minimum, the method may be crowned with success. But in the absence of such skill it is bound to be a failure, and the difficulties are of such a serious and fundamental nature as to lead to the desire for another and simpler plan.

(To be Continued.)

*Colorado meeting American Institute of Mining Engineers, Sept., 1896. (Revised Proofs Dec. '96.)

† A similar state of affairs has been shown to be the case by Professor Hittorf (*Ostwald's Chemische Energie*, 2te Auf., ii., 880) in the electro-deposition of potassium-silver cyanide. I have also noticed a similar state of affairs with copper. When a solution of potassium cuprous cyanide is electrolyzed with a platinum anode at a voltage below that at which metallic copper is deposited on the cathode, yellowish-brown crusts of cupric cyanide separate out on the anode. These dissolve in the electrolyte when stirred. Fragments of the crusts that drop from the anode on the cathode are reduced to metallic copper. At a higher voltage metallic copper comes down on the cathode from the solution generally. I have also noticed a similar thing in electrolyzing potassium aurocyanide with platinum electrodes. In order to see this action clearly, it is necessary to avoid an excess of free KCy.

Rapid and Slow-Drop Stamps in Colorado.

From Our Special Correspondent.

The stamp-mill capacity of Black Hawk, Central City and Nevadaville is shown by the following list of the mills in the district:

	Stamps.
Penn Mill	25
Iron City	25
Randolph	50
New York	75
Gilpin	50
Black Hawk	125
Eagle	35
Polar Star	40
Prize	25
Meade	40
Hidden Treasure	75
Climax	25
Kipp & Buell	60
Vendome (old mill)	25
Vendome (new mill)	30
Gold Coin	18
Total	748

Of this number, about 500 stamps are now dropping. Of the mills, all have the old Gilpin county slow-drop stamps, excepting the new Vendome, the Iron City, Eagle and Penn, the last-named having ten rapid-drop stamps and fifteen slow-drops. The slow-drop stamps run about thirty drops to the minute and the rapid-drops about sixty-five. The slow-drops will crush on the average about one ton to the stamp per day and the fast-drops, it is claimed, have about double that capacity. The slow-drop Gilpin county stamp weighs 525 pounds, drops 19 inches in a low mortar with deep issue. It is maintained by a staunch advocate of the old style mill that, owing to a peculiarity of the ores handled, better results are obtained from a slower motion than from the more rapid—that where a little time is not given for the materials to settle, it will either scour off the plates or not come in contact. In the same mill the average amalgamation is about two-thirds, inside. The plates used are 4½x8 feet, in connection with which is the well known Gilpin county bumper, for concentration.

On the other hand, competent millmen here, who are operating both the rapid and slow-drop stamps, and who have been making tests of the same ore in the two kinds of mills, assert that, with the rapid-drop stamps, the milling capacity is not only doubled but the results on the plates are more satisfactory, a better saving being effected. They maintain that better results are attained by the rapid motion, and that, by giving the plates the proper inclination, the danger of scouring them off is obviated. The new rapid-drop mills are equipped with modern appliances, which require no handling of the ore from the bins till the process is complete.

While it cannot be denied that the old-time Gilpin county mills have always done good work, and that they made Gilpin county mine development possible in earlier days, the general belief is that they will gradually be supplanted by the fast-drop stamps as rapidly as changes are made, and that new mills will hereafter be of the later pattern. There are conditions now existing which have to be met by the stamp mills, calling for more rapid work and, if possible, closer saving. The Denver and Pueblo smelters now make a much lower charge for treatment than formerly, and the Gulf road makes the following freight rates on ore from Black Hawk to Denver, which are regarded as very low and advantageous to mine operators: Ores below $10 per ton in value, $1 per ton; ores running from $10 to $30, a rate of $1.50 per ton; running above $30, a rate of $2 per ton. Under these conditions, a much larger proportion of Gilpin county ores go to the smelters than formerly. It is estimated now that about 1500 tons of ore per month are being shipped to the smelters, and that the year's work shows an increase of from 25% to 35% of smelter sulphurets over those of 1895.

This all means, not a decrease of mill work, but a heavy increase in the production of the district. It means that such ores as are non-amalgamable, not adapted to either mill or concentrator, which formerly would not pay to ship, are now capable of being sent to the smelters at a profit. The iron and copper pyrite nature of these ores makes them desirable at the smelters.

The Rocky Mountain concentrating mill at Black Hawk, which treats from 1000 to 1500 tons of ore per month, is doing very satisfactory work with the ores heavy in iron pyrites, and is successful with those of a low grade as well as the higher grade. This plant distinctively fills a place in the district, since it is able to handle that class of refractory low-grade ore which would not bear shipment to the smelters and with which the stamp mills can do nothing. It should not be overlooked, however, that all the mills of the county apply a subsidiary concentration, which enables them to effect a higher saving than they have sometimes been given credit for.

An item having some bearing upon the relative merits of the slow and rapid-drop stamps for this district, is the fact that the Vendome Company, having a 25-stamp slow-drop mill, this year put $30,000 into a 30-stamp rapid-drop plant, which is now operating at full force, while the old mill is inactive. I do not overlook the fact, though, that the bulk of the work of the county is being done by the old-style mills.

Central City, Dec. 30th, '96. WASCOTT.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The drift south from the 700-foot level in the Central Eureka has been reopened and extended 200 feet. In the bottom a large mass of quartz has been encountered which carries good looking sulphurets.

Lane & Hayward, who have been operating the Treasure mine and sunk the shaft 400 feet, have suspended operations and ordered everything to be taken out of the property.

The Baliol mill on Sutter Creek is nearing completion.

The Eastern owner of the Pocahontas has ordered the shaft driven to the 1000-foot level before any prospecting of the ledge be done.

Butte.

Mercury: On the Middle Fork below Mooretown there are four small stamp mills.

Placer claims are being worked by J. H. Grubbs at Mooretown, Williams & Sons, Kitrick Bros., Dougherty and Nelson at Lumpkin.

Savage and Garrison are working DeLapp's claim on the Middle Fork, and some other claims are being operated on the same stream.

The Gold Bank mine at Forbestown has a 40-stamp mill, canvas plant and chlorination works. About 100 men are now employed, and the Golden Queen mine, recently purchased by Mr. Scow, is being worked through the Gold Bank.

S. O. Conlyli has just completed a 5-stamp mill on his mine by the river.

The Burlington mine will be prospected by two shafts 500 feet apart, striking the ledge at a depth of 400 feet.

An Eastern company is running a tunnel on the Missown mine and are in 400 feet. They expect to tap the ledge within 35 feet.

Calaveras.

Angels *Voice*: The Maltman mine has been cleared of mud and water—the accumulations of thirty years. The shaft, which is down about 80 feet, has been put in good condition and sinking has begun.

W. H. Clary, Jr., of Railroad Flat has a bond on the Petticoat mine at that place, and has everything in readiness to pump out the water.

Mountain Echo: The machinery on the Great Western mine, owned by F. Baumhogger, was started up for the first time last week, and the work of sinking the shaft and otherwise developing the mine will now be carried on.

Chronicle: The Lone Star or Hurley mine at West Point has been sold by the sheriff to J. R. Smith. The mine, mill and ditches brought $16,500.

A shipment of 67 ounces of gold was made from the North Star gravel mine last week.

The mill at the Moser mine has been shut down and about half of the force of men discharged. The work of sinking is being prosecuted, and it is expected to have everything running in full blast by the 1st of February.

Old works were broken into at the El Encino mine last week; and owing to the large body of water encountered, all work had to be suspended. The company intend to at once rid the mine of water, when operations will again be resumed.

Angels *Voice*: The mines at Copperopolis and at Campo Seco are idle, and the production of copper for the past few years is from the leaching of ore piles.

In the Madison mine the inclined shaft has reached a depth of 1350 feet. Levels are opened at every 100 feet, the longest being at the 900 level, where a drift extends 1000 feet north toward the Gold Cliff, and also from the shaft 500 feet south. Other levels are each several hundred feet long. The surface plant consists of water-power hoist and air compressor and a 40-stamp mill. Air drills are used almost exclusively in this mine. Thirty-eight men are employed.

The Iron Rock, near Angels, after years of idleness, is being reopened by Geo. W. McNear of Oakland. Five men are employed.

At the Carson Creek mine near Robinson's Ferry a new air compressor has been put in and the mine systematically developed. The hoist and 40-stamp mill are run by water power. Forty-two men are employed.

Citizen: The new 40-stamp mill at the Gwin mine is crushing low-grade ore from the 1200, 1300 and 1400 levels. The ledge at the 1400 foot level, which was cut some time since, shows up 15 feet wide. No stopes have been started as yet, the ore being taken from the breasts. The mill is illuminated by sixty electric lights, furnished from the new electric plant.

At the Venus mine at Campo Seco the shaft has been sunk to a depth of 100 feet and crosscutting has begun. Several stringers have been cut, all of which prospect well. Preparations are now being made to erect a hoist.

A new 40 horse-power double engine has been built for the Ford mine.

El Dorado.

(Special Correspondence). — The Jeffrie Gravel Mine Co., one and one-half miles east of town, is completing a 10-stamp mill. The tunnel has reached 625 feet, and 100 feet additional will be run, when an upraise will be made to the channel.

The tunnel on the Union quartz mine, one mile from town, is now in 300 feet, and 130 feet more will reach the shaft, which is 140 feet deep on a 6-foot ledge.

J. V. Selby, who has bonded eighty acres on the Larkin ranch for a Montana company, expects to let a contract this week for 200 feet of shaft and other development work.

Isaac Y. Doan, the San Francisco oyster king, has bought a one-third interest and associated himself with L. D. Graeter in the Jeffrie gravel mine.

O. W. Frost has begun work on the property recently purchased from Skinner & Co., one-half mile north of town.

Nugget: J. L. Houx of Shingle Springs has bonded to E. McCue, El Dorado Flat, below Shingle Springs.

A shaft has been sunk on the Manzanita gold quartz mine, Kelsey district. It is following a 4-foot ledge with good prospects.

Hill Bros., of El Dorado, have finished a run on ore from their mine adjoining the Union gold mine, El Dorado district, milled at the Union gold mine, that netted $40 per ton.

Sinking at the Amazon, Kelsey district, is stopped on account of too much water. Drifts are being started from near the bottom.

Inyo.

Register: A syndicate has an expert at Fish Springs district with a view to getting most of the claims on the hill.

A. G. McAfee's copper claims twenty miles northeast of Alvord are attracting attention since the bonding of the Sanger-Danielson copper properties at Saline valley. This is one of the most extensive copper croppings on the coast.

Kern.

Californian: Mining men are interested in the discoveries being made in Keysville and Havilah districts.

H. W. Blaisdel has closed down his works on the O'Brien property, but intends to resume shortly.

About eighteen mining claims were filed for record to-day, most of them from Havilah and Kernville.

Mariposa.

Gazette: The Merced Gold Mining Company has about thirty men employed on the tramway. The dam is nearing completion.

Wm. McGinn is negotiating for the sale of his mine in Quartzburg, the Number One, to California capitalists.

Nevada.

Union: The hoisting works at the Indian Ranch mine have been put in and are now running.

Union: Supt. Dawson has commenced sinking the shaft at the Gold Hill mine. The mill is kept running most of the time, although the vein at present is a rather small one.

Transcript: The Eagle Bird is about to change hands, and it is expected to start up in a month.

Placer.

Sentinel: Woods, Bailey & Co. have finished their contract for the Blue Canyon Mining and Development Company, and the directors have put on men by the day.

Work was commenced last week on the Buena Vista quartz ledge, in Bunce canyon. Captain H. Newton of Lincoln and Geo. A. Tubbs of San Francisco have purchased a half interest from Thos. Buckley. The Buena Vista ledge is about 3½ feet in width.

G. B. McCullough and D. H. Mills, who own the M and M quartz mine, on the lower end of Gillis hill, are building a ditch from Niggar ravine to their ledge.

Plumas.

Bulletin: The Quincy Mining and Water Company have completed their debris dam at Green flat, work on which was interrupted by the early storms in October. The company have fitted up their mine at Bean hill.

McElroy, Konradi and McElroy are working Gopher hill diggings with success.

At Johnsville the new Jamison mill, S. W. Cheyney, manager, has begun crushing ore. The ten stamps crush thirty tons daily. Thirty men are employed.

The Four Hills Company have resumed running and crushing ore with the 10-stamp mill. About twenty-five men are now employed.

It is understood that the Plumas-Eureka mine will resume work next spring.

Independent: All work has stopped at the Thistle shaft for the present. The water for several days past has raised fifteen inches in twenty-four hours. The source of this supply is generally believed to be from a rift in the pipe clay over which a stream had heretofore run.

The new tunnel in the Bald Mountain Extension drift mine, being run for the upper part of the channel, is making good progress through soft bedrock. Pay gravel is still being taken out from the lower ground. There are at least three miles or more of undeveloped channel northward to the end of the Extension claim, besides the deep, lava-capped, ancient river beds of what were evidently secondary streams and other leads above unprospected.

San Bernardino.

Independent: J. W. Wilson and Wm. Baldridge have sold their group of five claims at Twenty-nine Palms to H. U. Mudge of the Santa Fe, and development work is going rapidly forward. Four shafts are now down 45, 25, 50 and 18 feet, respectively, the ore body running from 2½ to 3½ feet in thickness and ranging in value from $18 to $220 a ton—free milling. They now have in contemplation the erection of a 10-stamp mill at Wilson's place, at Twenty-nine Palms, on Deadman's lake.

Two months ago Superintendent Church came down from the north for the people who had bonded the property from E. J. Baldwin, hired twenty men and put them to work on the old Gold Mountain mine, in the Bear Valley district, on which no work had been done since the burning of the large stamp mill twenty years ago. Work has been suspended and the men notified that there will be no resumption of operations.

San Diego.

Sentinel: At Picacho the assessment work has been done on 250 mines during the past two months.

The Golden Dream mill will soon be ready to run.

In the White Gold basin the Pleiades group of five mines leads off with the largest bodies of ores discovered in this section. Col. Allen has ordered a 60-ton mill for his group.

The Capella group of five mines, situated also in the White Gold belt, is being opened preparatory for another 60-ton mill.

Shasta.

Free Press: E. P. Connor has contracted with the Mountain Copper Company to sell them 3000 tons of low-grade ore from his mine on Salt creek.

Sierra.

The old Hawkeye mine at Potosi, owned by Overstreet, Todd & Co., is employing ten men. Good paying ground is being worked.

Colonel Massy of Chicago is having considerable work done on the copper mine on the north fork of Canyon creek. It is said that this lode yields a large percentage of copper. A contract has been let to run 300 feet of tunnel to tap the lode.

The mill has been closed down and most of the men have been laid off at the Sierra gold mine. It is understood that they will start up again as soon as they can devise some means of saving the sulphurets. About nine men have been kept to run the tunnel.

Siskiyou.

News: Work is progressing on the Brown Bear group of quartz mines, Salmon river. The ledge has been tapped by tunnel 400 feet below the croppings, with richer ore than in any of the upper tunnels.

The new company that purchased the Last Chance mine, near Callahans, has constructed a canal and turned Scott river through it, to work the bed of the river with an elevator.

Mr. Fore and associates have purchased hydraulic property on Salmon river.

Tuolumne.

(Special Correspondence).—In the Providence mine, near Carters, sinking and tunneling have developed a large body of ore, and an arrastra will be put up for making tests, with a view to putting up a stamp mill.

Machinery for a mill with a capacity of sixty tons a day has been purchased in San Francisco for the Modoc mine, owned by George McGillivray and W. E. Meek of San Francisco. This is a new mine, near the Buchanan, discovered about three months ago. A pay chute has been opened up over 400 feet long, averaging 15 feet in width, with ore that will all pay from $6 up to very rich streaks that give high yields.

Union-Democrat: At the Confidence the 30-stamp mill is completed and was started up last week. Twenty miners are employed.

At the Arbona a 200-foot tunnel taps a vein varying in size from 2 to 5½ feet in width, the ore of which gave an assay value of from $6 to $60. Drifts have been run north and south and sinking has been commenced.

A tunnel is being run to tap the vein below the shaft on the Mohican, near the Seminole group.

The Morris Bros. of Chinese Camp have struck high-grade ore in the Andrew Johnson mine. Arrangements are being made for working the property on a large scale.

Banner: Additional stamps are to be placed in the App mill.

The foundation for a 20-stamp mill is being laid at the Miller & Holmes mine.

A new mill is to be erected at the Golden Rule this spring.

The Soulsby mine has started up its mill.

The Jumper people are preparing to place an electric plant on their property. The power will be taken from Sullivan creek.

The Bellview mine and property have been sold to the California Exploration Company for $150,000. The new owners took possession last week.

NEVADA.

The cyanide plant on the property of the Dexter Mining Company at Tuscarora has started up again under the direction of Manager Fuller, and the output increased twenty-five tons daily. The plant, which was working most satisfactorily when the cold weather settled over that locality, was out of doors, and at the first freeze-up was shut down. Means were devised to overcome the cold and the result was the housing of the tanks, the erection of a boiler and the heating of the plant with steam.

Pioche *Record*: The strike in the old West Point claim, west of town, has renewed interest in that vicinity and several claims which it was proposed to let run out were protected by the owners at the last moment.

Central Nevadan: Forty men are employed at the Adelaide copper mine, near Golconda, this winter.

Lyon County *Times*: Considerable work has been done on the Logan & Hully mine, and it is reported that the old Welter mill will be torn down and moved to the mine and work commenced on an extensive scale. There is low-grade ore enough in sight to keep a 10-stamp mill running for ten years.

Walker Lake *Bulletin*: At Silver Peak the tunnel on the Mary mine is in 860 feet, the last 40 feet being in porphyry and quartz, which resembles the old Comstock very much. A few weeks ought to develop pay ore.

Tule canyon placers are still turning out gold.

Leidy, Raush and others, White mountains west of Fish lake valley, have average assays of $21 in gold, 74 ozs. silver and 40 per cent lead.

Pioche *Record*: The main topic of conversation at De Lamar at the present time is the big strike in the Magnolia mine at Helena.

The strike in the old West Point claim west of Pioche has renewed interest in that vicinity, and several claims which it was proposed to let run out were protected by the owners at the last moment.

Austin *Reveille*: The Keystone mill has been started up preparatory for a regular run.

The Wenban-Cortez mill at Cortez is running day and night at full capacity.

The quartz mill at the mouth of the Lander Hill tunnel in Pony canyon, at old Clifton, will be completed in a very short time by the Austin Mining Company.

Gold Creek *News*: At the Oro Grande mine a ledge of ore gave an assay value of $27 a ton in gold. The owners have given Ogden people a three-fourths interest to develop the property and put a mill on it.

At the Gold creek placers the reservoir will when finished hold over 900,000,000 gallons of water. It covers 137 acres. The plans contemplate the further raising of the dike and dam 25 feet when its capacity will be increased to 3,000,000,000 gallons. The inlet ditch will also be completed this month. It is 8 miles long 4 feet on the bottom with a 3¼ foot grade and is designed to carry 3000 miners' inches. Work on the distributing ditches will proceed during the winter to prepare for placer mining in the spring. Then 40,000 yards of gravel a day can be handled, much of which carries more than a dollar in gold to the yard.

OREGON.

Baker City *Democrat*: There are now about twenty men at work at the Maxwell, on Rock creek, and it is expected that the mill will be started up within a few days.

About twenty miners are at work at the Baisley-Elkhorn mine under the management of Mr. Symms, and it is expected the mill will again be running soon after January 1.

A. Geiser, superintendent of the Bonanza, has bought for $15,000 the Pyx and will operate it this season.

Bedrock-Democrat: In the Cracker Creek district the North Pole is developed 3000 feet or more, one tunnel being 1700 feet in length. An upraise of 500 feet in height is about completed. In the lower, or Baring gold tunnel, the ore vein is 6 feet in width in the face, and ore is of high grade and concentrating in character. In the stopes the vein is 8 feet in width. In the upper levels the vein varies from 6 to 12 feet in width.

Grants Pass *Mining Journal*: A short bond has been given to Tacoma parties on the Big Mountain mine in Missouri Flat.

About forty men are employed on the Black Gold Channel mines building a reservoir and ditches.

The purchasers of the Olalla placer ground have organized as the Paradise Alley Mining Co. and are now pushing work rapidly. Over fifty men are employed.

Rogue River *Courier*: The Black Channel mine is being run by the old Shotwell Company of Seattle and forty-five men are employed.

Baylord & Iliff's pumping plant is in operation on the banks of Rogue river. Six men are employed at the plant and fifteen in the timber cutting wood for it. Eight cords are burned up in twenty-four hours. Already a big hole has been piped in the bank.

The nickel mine at Riddle will, it is said, start up in the spring.

WASHINGTON.

Spokesman-Review: The Lalla Rookh group of mines on Colville mountain, two miles above Cascade City, was bonded about a week ago to Toronto parties for $75,000.

The Young America and Cliff Consolidated Mining Company has been incorporated with a capital stock of $1,000,000 to work the Bluff, Sunset, Young America and Cliff, within one-half mile of Bossburg, Stevens county. A compressor plant has been arranged for.

BRITISH COLUMBIA.

Several discoveries have been made close to Vancouver City. Copper deposits have been located on Frederic's Arm. Copper deposits directly opposite Vancouver and four miles across the inlet have also been located, while other copper claims have been staked close to the water dam which supplies the city with drinking water.

Spokesman-Review: The War Eagle mine at Rossland has been sold by Patrick Clark to the Gooderham-Blackstock syndicate, Toronto, Ontario. The price is in the neighborhood of $850,000. Up to the present time the War Eagle has paid $187,500 in dividends and has large reserves of ore. It was located in 1889 by Joe Morris and Joe Bourgeoise, and passed through all of the ups and downs, mostly downs, to the discouragement of the owners, before passing into the hands of the present company, in 1894. Systematic development was commenced the same year, and in the summer of 1895 the first dividend, of $37,500, was declared. This syndicate some time ago purchased the Crown Point. A new corporation will be formed, and will include the War Eagle, Crown Point group of mines, the Tiger and Uncle Sam. All of these, excepting the War Eagle, are located in the south belt of the Rossland district. In addition to these, a number of Slocan properties will be included.

At Rossland the recent discoveries of high-grade argentiferous galena on the south belt, in addition to the known existence of auriferous copper and iron sulphides of shipping value, have greatly stimulated work in this section of the camp.

A seven-drill compressor has been placed on the Homestake and a contract let for the installation of a ten-drill plant on the Lee.

North & Govan have cabled their agents to commence work on the Little Darling and Flossie L. at once.

At Ainsworth Braden & Mathews, owners of the Tariff, have bought a boiler and pump and will put on a large force of miners at once and will begin shipping ore.

The King Solomon Company will also begin work very soon. Theirs is a high-grade silver proposition.

The Dellie is still making good progress with their tunnel, having driven nearly 300 feet. At 250 feet in on the tunnel a stringer of rich ore, running nearly parallel with the tunnel, was cut.

From East Kootenay, near Fort Steele, during the past year, the North Star mine shipped 3300 tons of ore.

The Invicta Hydraulic Company are pros-

pecting for the channel on their claims on the Wild Horse. They are now taking good pay 50 feet above the bedrock.

A Montreal syndicate will put in a bedrock flume on Perry creek, about 30 miles from Fort Steele.

A number of claims on Perry creek have been opened up this winter and several have been bonded to outside people.

Spokane *Chronicle*: In the Deadwood camp of the Boundary district, the Great Hope mine has been sold for, it is understood, $12,000.

It is estimated that the necessary plant and machinery for the complete equipment of the Currie mine, near Silverton, B. C., will cost about $20,000.

Mining Journal: J. E. Young, who has been in charge of the Pittsburg dredger, states that about forty days were spent in operating and prospecting with the dredger. For the last few days from $40 to $70 per day was taken out, and the work was much interrupted by unforseen difficulties that experience only can overcome. The last work was done on nearly bare bedrock, the rock being decayed, and was dug out several inches in depth, and in this most of the gold taken out was found. The machinery gave out several times, but can be easily remedied. While the cost of the dredger was more than was figured on before beginning, and the results so far not brilliant, enough was done to satisfy them that this pattern can be worked successfully and money made with it in the river beds of Cariboo. The Underwood dredger will have some changes in its machinery, but will no doubt be operated next season. The Alexandria dredger did not pay. Other parties from Chicago, Pittsburg and other sections contemplate going into dredging, and the question of cleaning up the rich beds of old rivers in Cariboo will without doubt in some way be solved in the near future. So far, while no dredger in the country has been a complete success, it cannot be said, with the exception of one or two cases, that they have been a failure. Within a few years there will be dozens of dredgers on the Fraser, Quesnelle, Nechaco, Blackwater, Smoky and other rivers in British Columbia.

UTAH.

Salt Lake *Tribune*: The vein developed in the Silver King is perhaps the largest that has been uncovered at Park City, and at one station is as much as 127 feet between walls, the quartzite supporting and the lime underlying the ore body. At the same point is a breast of ore 110 feet in width, while at places it is over 60 feet in depth.

It is said that overtures have been made to the owners of the Independent Tesora, at Mammoth, and that as soon as the workings from which the water is now being pumped are dried, an expert examination will take place to determine what price shall be fixed upon it.

At Richfield the Butler-Beck mine has been sold at auction to Judge W. W. Wallace for $8578. It is one of the oldest and best known mines of Gold mountain, and the auction price is considered almost nominal. Upon the several claims has been done about 1000 feet of development work, that has showed up the ledges in good shape, the largest vein being 5 feet wide and assaying $12 gold, 2 to 5 ounces of silver. The new owner announces that he will commence active operations in the spring. The mill is not large enough to properly handle the ore, and one of the first requisites will be a series of tests to ascertain the best method of treatment.

Mammoth *Record*: The new air compressor and machinery of the Emerald Company have been placed in position and are now in operation. The shaft is down 410 feet, and sinking at the rate of about 2½ feet a shift will be continued to a depth of 700 feet, when drifting will be commenced on the 600 and 700 levels.

Shipments from Tintic district for the past year nearly equal the amount shipped from all the other camps in Utah combined.

Tribune: The deal in which Capt. De Lamar has contracted to pay $1,500,000 for the Mercur mine is doing much to stimulate interest in the diggings of the camp, and it is reported that negotiations have now commenced between Charles Butters and the owners of ground over there in which ore enough has already been blocked out to justify the erection of a mill early the present season.

Bingham *Bulletin*: There were twenty-eight certificates of location filed in the recorder's office of West Mountain district between the 1st and 4th insts. Included were several well-known former locations, jumped by parties who knew them to be delinquent but valuable.

The 200 level of the Winnamuck is showing six feet of ore that averages fifty ounces in silver.

The force on the Starlus mine is to be increased.

Mercur *Mercury*: West Dip continues to be the Mecca for mining men, and the week has seen no diminution of the rush to that section. A great deal of bonding and leasing has been done, and several sub rosa sales are reported. The De Lamar people are still operating the Daisy group under their option. La Cigale is opening up greater ore bodies. On the Patterson group the vein has been uncovered and ore running $2 and $3 exposed. The Mercur Gold Production Company has $4 ore in its Edna May claim, and good prospects for a mine at little depth. Scheu and Mayne have the vein in the Black Dog and Gray Rooster, while north of Ophir canyon they are developing the Mississippi, Black Pearl, St. John and Emma groups, and have defined the vein in each of these properties.

Several representatives of big English concerns have been in the camp. The first to arrive was Prof. Mitchell, who has been here some weeks, ostensibly making a study of the geology of the camp. He was followed by Charles Butters from Johannesburg, who is popularly supposed to be here for the purpose of experimenting with the ores with the Siemens-Halske process. Later in the week V. M. Clements arrived. He was of the staff of John Hays Hammond at Johannesburg. It is said E. Bates Dorsey is also en route to the camp.

Tintic *Miner*: The showing now being made in the Bullion-Beck is reported to be the finest in the history of the mine. Local parties who visited the workings of the mine this week say that there is more ore in sight than they ever before saw in any mine.

It is reported that the drift on the 700 level of the Grand Central has reached the ore channel.

Lester Taylor, Thomas Wimmer and Ed Collet of Payson purchased a two-thirds interest in the Defender and one-fourth in the Ruby claims, lying west of the West Cable property. The drift on the 700 level of the Grand Central is now in 700 feet and is being pushed with the greatest possible haste toward the ore body.

IDAHO.

At Silver City the Trade Dollar group milled during the year 7892 tons of ore in its 10-stamp mill, saving 92.41 per cent of the assay value. One carload of ore, weighing 22,846 pounds, shipped to the smelter, gave returns of $50,438.87.

Spokane *Chronicle*: At Florence in the Banner the principal shaft is down 100 feet and a contract has been let to sink 100 feet more. At the 100-foot level drifts are being run 200 feet each way. All the drifts and shafts are in a good class of free milling ore. A 10-stamp mill will be put in in the spring.

On the Gold Bug the principal tunnel is now in about 500 feet, which gives a depth of about 125 feet. The ore body averages 2 feet in width.

One company which has been placering in the Florence basin for a number of years is said to have taken out more during last summer than in all the five years preceding that put together.

MONTANA.

Butte *Miner*: A rich strike is reported from the Gold Flint. On the mine in the past a great deal of money has been spent and it has yielded its owners several hundred thousand dollars. The lead was lost several years ago, and after the property changed hands several times the big lead is again found.

Inter-Mountain: The Colorado company began operations last week on the Betsy Dahl, at Meaderville. A shaft-house has been erected, the engine and boiler are now in place, and in a day or two the work of pumping out the mine will begin.

The old Amber mine, at Marmion, in New York gulch, twenty miles northeast of Helena, promises a largely increased output for the year. It is being operated by Buffalo, N. Y., capitalists and is under the management of Prof. J. H. Kerr. To treat the concentrates a cyanide plant will be erected as early in the spring as the work can be accomplished. The machinery and material for the new plant has been purchased.

A. M. Esler, who has been running the Eureka mine at Rimini since last spring, has during the time mined and concentrated 10,000 tons of ore. The property has given employment during the time to about 100 men.

The improvements at the Original have been completed and a few men put to work. Sinking will be begun in a few days from the 800 level.

The Colorado company has arranged for the purchase of the Old Glory at Centerville for $45,000.

Inter-Mountain: At the Boston & Montana works the concentrator, which had been closed for three months, has been started up and forty men put to work in that department alone. The management announces that every department will henceforth run full blast, and that as soon as provision can be made for them 200 more men than were ever before employed will be at work.

Western Mining World: Work is resumed on the Consolidated Mining Company's property, Cable district.

William Cliff of Gilt Edge is driving a tunnel in 200 feet on his coal property. When completed this will put over 10,000 tons of coal in sight, for which he receives $2.50 per ton at the mine.

At Clancy sixty men are on the pay roll of the East Pacific mine, the property lately purchased by R. A. Bell.

A syndicate has a diamond boring drill in operation near Missoula, prospecting coal beds.

SOUTH DAKOTA.

Black Hills *Times*: At the new district west from Ragged Top and across Spearfish canyon, over 500 claims have been located and recorded, with probably double that number simply staked. Float rock is found in abundance that assays from $4 to $280 gold per ton. Development work is retarded by the deep snow.

The new machinery and castings to remodel the Richmond silver mill in Galena camp to an 80-stamp gold mill have been ordered. The Union Hill Company are now working forty-five men on their Richmond-Sitting Bull mine at Galena and taking out a large amount of ore.

A large vein of silver-lead ore carrying a little gold has been opened up on the Silver Mountain group of claims, near the head of Slate creek. Assays show 45 per cent lead and 98.7 ounces silver per ton. The vein has been opened at several points for 300 feet in width and shows a stratified mass of quartz, slates and schists.

The report is current that siliceous ore similar to the Ragged Top ores has been discovered at Bull springs, near Hell's canyon, in the limestone belt in Custer county. Custer is reported nearly depopulated.

There was a great deal of relocating claims going on New Year day, though so far as heard from but a very little jumping. Those who might be disposed to jump claims have been quieted by the recent action of the miners at Ragged Top.

Another Ragged Top camp has been found in the Spearfish Buttes, up the canyon from Spearfish town. The discovery consists of a 3-foot vertical vein of ore in the limestone formation.

The St. Elmo M. & M. Co. having demonstrated the value of the ore in their claims, near Hill City, by runs in their 2-stamp mill, have decided to erect a 20-stamp mill.

Work has been resumed in the Ruby Bell mine in Ruby basin, after four years of nearly continuous idleness.

COLORADO.

(Special Correspondence).—The Mountain Chief mine, adjoining the Tom Boy, near Telluride, was recently sold by A. J. Clark and B. W. Thayer to L. H. Jackson of Denver for $100,000, there being a cash payment of $15,000. The Mountain Chief is partially developed.

Rocky Mountain News: At Cripple Creek the output of the principal producers for 1896 in smelting, chlorination and cyanide mill ores was as follows:

	No. of Tons.	Value per Ton.	Total Value.
Portland	28,000	60	$1 648,000
Independence	10,000	90	900,000
Isabella	10,000	60	600,000

Total	193,420	..	$9,726,500

Republican: At Idaho Springs tellurium ore has been cut in the Chicago Bell vein. It is 4 inches wide and came in in live rock after it had changed from the surface quartz.

J. H. Shepherd is opening some new bodies of ore in the Shafter mine through the lower level in the 600-foot shaft. The streak is all pay and measures 30 inches wide.

In the Jack Rabbit mine a new body of ore has been opened through the adit level, and the streak measures 2½ feet wide.

The Eagle River Tunnel and Mining Company has incorporated with a capital stock of $3,000,000. The scene of the company's operations will be on Battle mountain, on ground lying between and adjacent to both the towns of Red Cliff and Gilman. Some forty claims owned by Cheeseman and others and fifteen owned by John J. Hill and others, which will make fifty-five in all, have been consolidated. The preliminary work to starting a large development, drainage and transportation tunnel in the quartzite on the Battle mountain side of Eagle River canyon, near Gilman, in what is known as Eagle Bird gulch, will be begun at once.

The number of mineral surveys in 1896 was almost double the number of 1895. The following table shows the number of surveys approved in each county of the State:

County.	1895.	1896.
Boulder	11	25
Clear Creek	23	39
Custer	10	1
Chaffee	5	5
Dolores	1	2
Douglas	..	2
El Paso	375	803
Eagle	3	5

Summit	21	8
Saguache	3	4
San Juan	11	15
San Miguel	13	8
Totals	681	1,238

At Cripple Creek Cramner Brothers have sold a half interest in their lease on the Trail to Christopher & Lanterman for $8000, and a lease on the Big Ranta of the Arequa Company for $1000, and the entire group for the entire 600 feet of the main lease on the Trail is to be consolidated and worked by the joint owners.

Jennings Brothers have opened the second chute in their Gold Hill territory, and find there richer ore than in the first one opened on the Gold King of the Alliance Company. This time it is in the Lillian Leland of the Anchoria-Leland Company.

A sale is under way for a controlling interest in the stock of the Mars Consolidated Company, which owns a group of properties on Cripple Creek Heights, now being worked by a number of lessees.

At the Hallett & Hamburg at Victor new machinery is to be put on at once and the 4½-foot ore body opened at the 100-foot level will be made to produce more heavily after the improvements are in place.

Contracts have been let for 100 feet of sinking on the Little Tom, on Cow mountain, being worked by W. E. Jones and J. E. McDuffie. A strong vein has been opened in the property.

NEW MEXICO.

Silver City *Enterprise*: At Pinos Altos the Bell & Stevens has been started again on ores from the Pacific and Mina Grande veins.

Rathbun brothers have a shaft 150 feet deep on the Monarch mine, with drifts running north and south from the shaft at the 100-foot level. The pay streak is 8 to 10 inches wide and averages $50 per ton at the smelter.

The Treasure Mining Company keeps a force of fifty men employed at the Atlantic mine and mill and makes regular shipments of bullion and concentrates.

W. C. Chandler has twenty men at work on the three upper levels of the Mountain Key.

At Central a strike of rich ore has been made in the bottom of the Texas shaft at a depth of 252 feet.

At Copper Flat fifty men are employed by the company, thirty in the mines and about twenty putting the machinery in place for the new smelter.

At Santa Rita members of a new company of Colorado who have leased the Oxide, Chino, Guadaloupe and Yosemite mines, owned by the Santa Rita Copper and Iron Company, will arrive to-morrow. This company has put up a cash capital of $100,000 to do development work and extract ore.

A crew of eight men has been put at work extracting ore from the Elnora mine. The mill will be started before the end of next week.

At Carlisle the Steeple Rock Company is employing 250 men on the properties. A steam hoist has been placed upon the Jim Crow and development is being pushed. The company is extracting from the Nugget mine, the Davenport claim and several other properties. Ten stamps and Huntington pans will be added to the mill, with which ore will be crushed and experimental tests made to demonstrate the best method of treating the ore. After a process of treatment is decided upon an extensive plant with a capacity of several hundred tons per day will be erected.

Santa Fe *New Mexican*: In Grant county the Elnora mill at White Signal is completed and will shortly be started.

At Central the Texas Company are working twenty-five men in their mine.

Las Cruces *Democrat*: A rush is taking place to the Jarilla mountains. Hardly a day passes but parties are seen headed for that camp. There are some of the finest turquoise properties in the Jarillas to be found in the Territory, while others are rich in copper and some have gold and silver in paying quantities.

ARIZONA.

Yuma *Sentinel*: Last week at La Fortuna mine, near Yuma, a new chimney of ore richer than anything heretofore struck in that mine, was opened up on the 300-foot level.

The Excelsior Gold and Silver Mining Company of Kingman is inviting bids for hauling 800 tons of material from that place to White Hills and vicinity. The company owns the Norma and Treasure mines. Five hundred tons of wood pipe will be used in bringing water from Hand springs, seven miles distant, to the mill at White Hills.

Prescott *Journal-Miner*: The Planet-Saturn Company's mill, at Fool's gulch, has been started up. The mine is opened up to a depth of 700 feet, and there is 6 feet of good ore at the bottom of the shaft. Since the company purchased the property, about fifteen months ago, they have done about 5000 feet of development work.

Tucson *Citizen*: Ex-Senator H. A. W. Tabor of Colorado and his brother have a small force of men at work at the Vulture mine. There have recently been tests made of the tailings from the mine that show them to be very rich, running about $3.50 to the ton. At Smith's mill, where the Vulture mine was once located, about 15,000 tons of tailings have been worked the past two years, from which was cleared about $50,000. Such good results being obtained by use of the cyanide process caused Senator Tabor to have an investigation made of the tailings from the Vulture.

Phœnix *Republican*: The Canon copper mines in Coconino county have been bonded for $13,000 to a Boston company.

An abandoned mine, which was being worked evidently fifty years ago, has been discovered near Mountain Springs, seven miles from Hillside and fifty miles west of Prescott. The mine was well developed and is rich in gold. The ore is a red iron oxide.

Jerome *Reporter*: W. P. Dorsey located an onyx claim in 1885 on the lower Gila, near the Real ranch, which may prove of value. The vein crops out for a distance of 1000 feet and varies in thickness from 1 to 40 feet. Mr. Dorsey recently sent some samples of the onyx to Tiffany & Co. and was advised that if it could be mined in large blocks it would be worth $1 a pound. A force of men will soon be put to work taking out the mineral and a sample carload will be shipped East.

At Congress there are about 400 men on the company's pay-roll. The cyanide plant is approaching completion; the roaster has a capacity of 100 tons per day. The building which covers it is 170x75 feet, and it is understood that a mill of eighty stamps capacity will soon be put in in addition to the forty stamps now in operation.

Geologic Mapping of the Mother Lode.

Written for the MINING AND SCIENTIFIC PRESS by H. C. HOOVER.

There has been some agitation of late by the California Miners' Association and others looking toward more geological work by the State. Various plans have been proposed for carrying forward such work, but in every case there appears a profound lack of information upon the scope, object and cost. The proposition to map the mother lode in detail seems to be the most prominent project.

The application of geology to mining beyond the outlining of the controlling geologic principles of a region is a matter to be determined in each specific mine. The searching out of the general principles is the work of the Government, and their application is the work of the miner. In the first case the work benefits the class and in the second it benefits the individual, and it is no more the business of the Federal or State Government to undertake such work than to advise the miner as to his health.

The United States Geological Survey has mapped and is now publishing a series of atlases upon a scale of two miles to the inch, covering the whole Sierra gold belt. In order to more thoroughly understand the nature of the region a detailed study was made at Nevada City and Grass Valley districts, and an atlas published upon the scale of 1000 feet to the inch. Such detailed work throughout the region would be of value, but the expense would not be compatible with the good which would result. The general atlases, together with the studies of typical localities, cover all of the points which it is the duty of the Government to determine. To do more would be to make an expert report upon the value and prospects of each mine, something that neither private owners nor public policy would permit.

Moreover, the Government has no more right to encroach upon the business of the prospector or engineer than upon that of the physician. It is said that detailed topographic maps would be of value to all enterprises in the region, but the increased cost over the present maps would not be commensurate with the increased service rendered. For instance, if an individual wishes to build a ditch he engages an engineer to make the surveys. The engineer studies the maps now published and learns the general route of the ditch. To furnish more data than this would be to survey the ditch itself, for no amount of detail contouring could dispense with the survey. The same applies to the location of a gravel channel or a quartz ledge.

Valuable scientific work can only be performed by specially trained and experienced men. Because a man knows the difference between pay and barren rock is no indication that he can determine the underlying geological principles of the district. To get the services of such men costs money. The United States has for years provided a bureau in charge of the best men and it has increased in efficiency and economy until there is no better or more economical work done in the world. The cost of the general atlases now published of California is from $5 to $11 per square mile. The Nevada City special folio, covering an area of 35.39 square miles, upon which every detail of geology and mining data has been outlined, was $280 per square mile. To map the whole region now covered by the general atlases upon this scale would cost $1,960,000. To map the mother lode would cost $350,000.

The State of California contains 158,000 square miles, of which the United States Geological Survey has topographically mapped 35,000 square miles. Of this about 15,000 square miles have been geologically mapped and 7,000 square miles published. The largest portion of this work lies in the Sierra gold belt. If the State of California wished to do geological work there is plenty of ground to cover without repeating, and that, too, of great value to the State. But the most valuable geological work has not been accomplished by areal mapping, regardless of the value of the region. It has been, as in the States of Pennsylvania, Arkansas and Missouri, by special work upon special subjects by specially trained men. For instance, a complete report upon California's borax or asphaltum or gold, describing their geology, mining, reduction, markets, and the cost and profit therein would be of the greatest value. Such work has been done and has yielded vast returns for the money invested, and that, too, with less annual appropriation than that of the State Mining Bureau of this State.

Electrical Progress.

An Electric Locomotive for Switching.

The use of the electric locomotive for switching purposes in steam freight railroad yards is likely to receive a marked impetus by the fact that one is now employed in connection with the New York, New Haven & Hartford Railroad, at New Haven, Conn. This locomotive is in constant service, switching freight cars between the main line of that road and a number of factories located along the river front. The line over which it operates is about two miles long and is the property of several large manufacturers. The track is of regular steam railroad type, with heavy steel rails, well ballasted and provided with switches and turnouts. In addition to the curves, there is a 2½ per cent grade against the load both ways on each side of Grand avenue.

The practice followed by the manufacturers hitherto in switching their cars has been for the freight engines of the N. Y., N. H. & H. R. R. to drop their cars at the Junction; from here they were hauled to the different factories by horses. This method was so slow, with the several curves and grades, and so hard upon the horses that the manufacturers were driven to the conclusion that some other method of traction must be employed. Steam traction was rejected, for the excellent reason that the line runs for some distance along a frequented thoroughfare, where a switching engine would be a dangerous adjunct. That the steam locomotive would also be standing idle under steam for a large part of the day and consuming coal uselessly, was also a weighty consideration.

Electric traction was finally adopted as presenting many economical and other advantages, and an order was placed with the General Electric Company for a 30-ton locomotive, which the company could guarantee could haul two loaded freight cars up a 2½ per cent grade at a speed of seven miles an hour.

The locomotive was delivered at New Haven on Dec. 8th, on the 11th was put into actual operation without preliminary test on the line, and since that date has been handling the entire movement of the cars between the factories and the Junction.

The dimensions of the locomotive are as follows:

Weight	58,000 pounds
Draw-bar pull	7,000 pounds
Length over draw-bars	16 ft. 6 in.
Height over all	11 ft. 6 in.
Width over all	8 ft. 3 in.
Wheel-base	5 ft. 6 in.
Diameter of drivers	44 in.
Number of drivers (with cast iron centers and steel tires)	4
Size of journals	5½x8 in.
Gauge	4 ft. 8½ in.
Voltage	500
Amperes, full speed and normal draw car pull	600
Amperes, half speed and normal draw car pull	300

The motors are two in number, each axle being provided with its own motor. The motors are gearless and are supported upon a system of spiral springs resting on the side frames of the locomotive track. The suspension being entirely upon springs, the wheels are free to adjust themselves to the irregularities of the roadbed, and the wear on both tracks and motors is thus consequently diminished.

ELECTRIC LOCOMOTIVE FOR SWITCHING.

In the armatures the iron-clad type of construction has been followed—that is, the windings are placed in a mica-lined slot cut in the surface of the laminated core. The armature and commutator are upon a sleeve, through which the axles pass. The sleeve rests in bearings on the motor frame. Two projecting arms from the sleeve fit into the openings in an iron plate loose upon the axle, and similar projections from the wheel enter the plate from the other side, so that, as the armature revolves, the wheels are revolved also. This coupling, being flexible, allows perfect freedom of motion. The commutators are of substantial construction and each motor has four sets of brushes.

The truck is constructed of I beams and forms the foundation for a locomotive cab, of sheet iron, with sloping shields at each end. It has two hinged doors, one on each side, and sliding windows at the sides, the front ones being stationary. As there are windows on all sides, the motorman has a view in all directions. The interior of the cab is finished in cherry and contains the rest of the electrical equipmet—automatic circuit breaker, controller, lightning arrester, reversing switch, air pump, air gauge, etc.

The controller is the L, two series parallel type, arranged for the control of two motors. It is of the same general type as the K2, with which our readers are familiar in ordinary street car practice, and is provided with separate reversing switch and the magnetic blow-out. The resistances are set beneath the shields and are of the packed ribbon type.

The automatic circuit breaker is of 500 amperes capacity and involves also the magnetic blow-out principle, as does the lightning arrester, which is set upon the floor of the cab behind the controller. In the front of the cab and above the controller is a circular dial ampere meter, reading to 500 amperes, and facing the motorman is the air pressure gauge. On the other side of the cab, opposite the controller, is an oscillating cylinder air pump, driven by a motor. This furnishes air to two air tanks suspended beneath the cab and is automatic in its action.

The air pressure pump is controlled automatically by a pneumatic governor, consisting of a cylinder containing a piston working against a spring. The action of this automatic control is as follows: A pipe running from the main reservoir enters the cylinder below the piston. As the pressure rises, the piston is forced upwards against a spring. The other end of the piston rod carries the contacts through which the pump motor circuit is made and broken. When the pressure falls below that at which the automatic control is set, the spring forces the piston down and the circuit is broken. Any arcs that may be formed when the contact is broken are blown out in the magnetic field. The locomotive is provided with a chime whistle, blown by the compressed air, and a railroad headlight is set upon each shield. Beneath each one of the shields is an iron sand-box provided with pneumatic feeding device.

Its operation is already attracting considerable attention from railroad engineers who have visited the scene of its operation. In order to show one of these engineers what the locomotive would do, six loaded cars were hauled up the steep grade with the slack all out, the start being made on a grade of about 1 per cent; 150 amperes only were required to start this heavy train, and it moved off smoothly.

Scientific Progress.

Reduction of Manganese Ore.

In the *Annales de Chimie et de Physique* Mr. Henri Moissan, the eminent chemist, gives the following directions for the preparation of manganese from its ores by reducing them electrically. Pure protoxide of manganese is mixed with carbon and heated in an arc of 300 amperes at 60 volts. In five or six minutes a complete reduction will have been effected, and a button weighing from 100 to 120 grammes remains at the bottom of the crucible. The reduc-

tion can be made with a 100-ampere 50-volt arc, and takes from ten to fifteen minutes. Operating with an excess of carbon, the following analyses were made of the metal obtained:

	1.	2.	3.	4.
Manganese	85.60	85.82	90.60	94.05
Carbon	14.50	13.98	10.20	6.35

If the reduction take place in the presence of an excess of oxide the quantity of carbon is much less, and in some experiments only 4 to 5 per cent was obtained. Manganese, when prepared in this way, can only be kept in open jars, if it contain but little carbon; when the proportion of carbon increases the moisture of the air decomposes it speedily. Small fragments placed in water oxidize in twenty-four hours, giving off a gaseous mixture of hydrogen and carbide of hydrogen. The decomposition in air is more active as the proportion of carbon approaches that of the carbide of manganese. Starting with natural manganese binoxide, as pure as possible (97.5 per cent), mixed with carbon and previously calcined by Perrot's method, and using currents of 500 amperes at 50 volts in a closed crucible, an ingot of the following composition was obtained:

	1.	2.
Manganese	80.78	91.13
Carbon	7.59	6.41
Slag	2.06	1.78

Thus 96 per cent of the oxide used in the experiment was reduced. M. Moissan thinks that this reaction is easily applicable to the commercial preparation of metallic manganese, and, as the molten metal can very well be refined in an excess of oxide, manganese free from carbon and silicon can be obtained. The manganese obtained from the last experiment was much harder than ordinary commercial varieties. When no carbon is present the metal is very hard indeed.

The Stars of the "Dipper."

"The seven stars in the Great Dipper," says Mary Proctor in *Popular Astronomy*, "are in reality seven splendid suns, probably very much larger than our sun, and glowing with intense luster. Iron, sodium, magnesium and other well-known elements exist in the atmosphere of these stars, and their massive globes, raging with fiery heat, rush through the depths of space with inconceivable speed. Five of the stars are receding from us at the rate of seventeen miles per second and the other two are traveling in an opposite direction. It is certain that these two do not belong to the same system as the other five. Thirty-seven thousand years hence the seven stars of the Great Dipper will have dissolved partnership, and its appearance will have changed. The handle of the Dipper will be bent and its rim out of place, for the reason that five stars will have drifted in one direction and two in another. During countless ages the stars which seem so steadfast have been rushing onward through space. There are stars traveling in 'family parties,' as Miss Clerke quaintly expresses it, colonies of stars of a friendly tendency drifting together, others less friendly drifting apart. Despite the fact that each star thus urging its way through space is an enormous mass of glowing vapor, yet the most perfect order and harmony prevail in the star depths."

A REVOLUTION has been quietly effected in the methods of refining copper, and nearly half of that produced in this country is now refined by electricity. The method consists in electroplating the metal from an anode composed of the "blister" or impure copper, the strength of the current and the composition of the liquid both being so chosen that nothing but copper is deposited upon the cathode, the impurities in the crude metal falling to the bottom of the tank in the form of mud. The great electrolytic refinery of the Anaconda Company in Montana produces from 100 to 120 tons of refined copper daily by this process, and is the largest plant of the kind in the world. A similar refinery at Perth Amboy, N. J., has a capacity of 10,000 tons of refined copper per annum.

Mechanical Progress.

The Metric System.

A correspondent writing to the London *Engineer* offers the following to show why the metre is not a measure for the standard, and is an inconvenient standard of length for the mechanical work:

"The metre was originally fixed without reference to practical considerations of convenience and utility, but simply as a theoretical fancy, to adopt the one hundred thousandth part of a degree of latitude as the standard measure, with the idea of basing the measure on the earth itself, irrespective of any minor consideration of utility. Unfortunately, this was subsequently upset by more correct measurements of the earth, showing that the metre was not really the one hundred thousandth part as intended, and it has now consequently to be referred to an authorized standard metallic measure, like other standard measures.

"A good practical illustration of the objection to the metre can be given from one branch of mechanical engineering—locomotive engineers. The cylinders are spoken of and thought of as 16-inch, 17-inch, 18-inch, 19-inch, etc., diameter, but in metre nomenclature these would be 630 mm., 669 mm., 708 mm., 748 mm., and they are so dimensioned on foreign engine drawings. Now, 16, 17, 18, 19 are convenient figures to speak of and to think of, and convey simple and definite ideas, but such figures as 630, 669, 708, 748 are cumbersome and inconvenient, and fail to convey a simple and definite comparison. As another illustration, the driving wheels are spoken of and thought of as 5 feet, 6 feet, 7 feet, 8 feet, diameter, but in metre nomenclature these would be 1.968, 2.362, 2.756, 2.949, and they are so dimensioned on foreign engine drawings, even more cumbersome and inconvenient than in the case of the cylinders.

"The two standards of measure—feet and inches—afford a striking facility and convenience in mechanical work generally, as in locomotives, inches for cylinders, axles, plate thickness, etc., and feet for wheels, frames, wheel centers, boilers, etc. In the original proposal of the metre an attempt was made to provide other units of measure by a pretty-looking series of decimally arranged standards: Kilometre, hectometre, decametre, metre, decimetre, centimetre, millimetre; but this, it was found, would not work and the standards are practically reduced to the two extremes, the kilometre of 1000 metres and the millimetre of 1-1000th metre. Of these the kilometre—about .62 mile—is alone found a convenient and useful measure, the millimetre—4-1000ths of an inch—being too small for general dimensions of machinery, and not small enough for fitting dimensions, as gauges and templates."

Compressed Air Locomotive.

This month the new compressed air locomotive for the Sixth avenue elevated railroad in New York City, with a cargo of compressed atmosphere, will be placed at the head of a train of cars, and will make its first trip. That the compressed air engine will soon be the entire motive power of New York elevated roads is believed by many. The engine just completed is built under the Hardie patents. These surface motors are a part of the cars which they propel, while the newly constructed locomotive is an engine in itself, entirely distinct from the train which it may haul. The new engine in appearance is very like the ones now in use, only it has no smokestack or the usual appliance necessary where there is combustion of fuel and escaping steam. In operation it is also like the present motor, as it is an engine which gets its power from compressed air instead of from steam. In the place of great coal sheds there will have to be a central plant, where, by means of steam engines, air is compressed into huge reservoirs with a pressure of 2000 pounds to the square inch.

In the present engine the power is created by combustion as the train proceeds, and the steam is also used to operate the brakes. In the new engine enough power is taken on at the start to last for from 10 to 20 miles, and the compressed air is also used to control the brakes. The engineer's duties on both locomotives are substantially the same, as both machines are under similar control.

A CAR has just been completed at Concord, N. H., which exemplifies what has heretofore been considered a chimerical idea of the novelist. It is cylindrical in form, just as the cars Jules Verne and others have told of have been. Its chief claim to fame lies in the fact that each section of the sides, with windows of curved glass, slides up under the roof, just as the curtain of the roll-top desk disappears as it is pushed upward. Just as the sides disappear a running board drops down just below the floor of the car, and in the usual position on the outside. In this way is the comfortable closed car transformed into a very neat appearing open car.

ON the French State railways it is stated that a number of passenger cars, in which all the parts were formerly manufactured from brass, copper and iron, with the exception of axles, wheels, bearings and springs, brake beams and couplings, are to be constructed of aluminum. The weight of a car provided with aluminum fittings is one and one-half tons less than that of the old coaches. As an ordinary train in France consists of twenty vehicles, the weight of the train would thus be reduced by thirty tons.

Practical Information.

Metallic Carbides.

Among the many new fields of work opened up by the introduction of the electric furnace, according to *Nature*, is the preparation of difficultly reducible metals undertaken with success by M. Moissan. These reductions being necessarily effected by the presence of carbon, the formation of definite metallic carbides of great stability soon becomes apparent, the properties of which came to be of such interest that their preparation was systematically attempted. Certain metals, such as gold, bismuth, lead and tin, do not form carbides at the temperature of the electric furnace, neither do they dissolve any carbon. The metals of the platinum group dissolve carbon with facility and deposit the whole of it, on cooling, in the form of graphite, the metals being unchanged. Copper, silver and iron take up carbon in quantities which, although small, are sufficient to cause marked changes in the physical properties of the metals. It is noteworthy that no definite crystalline compound could be obtained with iron. On the other hand, fused aluminum takes up carbon readily in the formation of the crystalline carbide, Al^4C^3, and the oxides of many other metals furnish similar crystalline compounds when heated in an electric furnace with an excess of carbon.

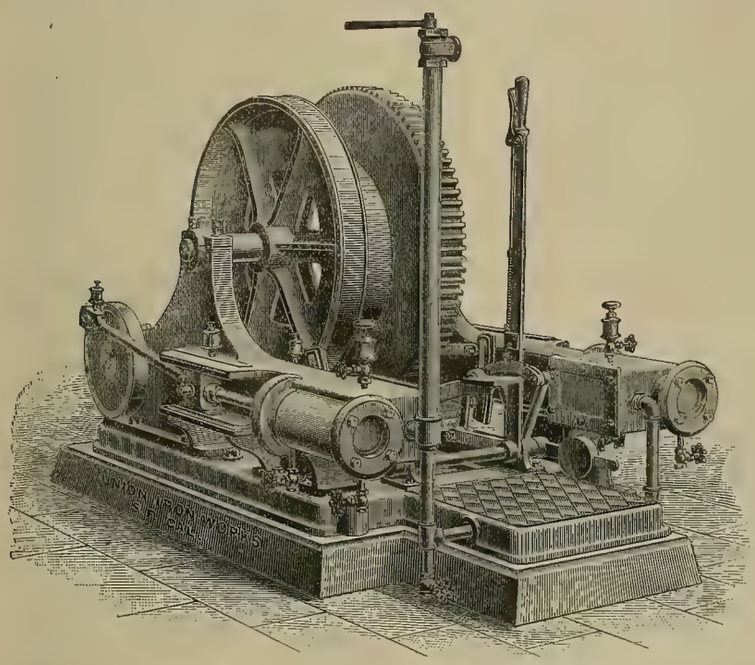
The behavior of these substances with water furnishes the most convenient mode of classification. The carbides of molybdenum, tungsten, titanium, zirconium—the latter having two—and of chromium—also having two—do not decompose water at the ordinary temperature. Of these reacting with water, the carbides of lithian, calcium, strontium and barium furnish a pure acetylene; of aluminum and beryllium, pure methane; of manganese, a mixture of equal volumes of hydrogen and lethane; while metals of the cerite group give crystalline carbides, all of which react with cold water, forming a complicated gaseous mixture containing hydrogen, acetylene, ethylene and methane. But the most complex reaction is that furnished by uranium carbide with water. In this case, in addition to the gaseous mixture containing methane, ethylene and hydrogen, liquid and solid hydrocarbons are produced in abundance. The carbides of silicon and titanium are extremely hard, the latter even cutting diamond.

A Rope From the Ocean.

The largest marine plant, and probably one of the highest plants known on this globe, is a gigantic seaweed, the nereocystis, the stem of which has been found to grow as much as 300 feet long. It was first discovered not far from the Alaskan coast, but has since been found floating in various parts of the Pacific ocean along the American and Asiatic shores. This seaweed grows in a very curious manner. Large quantities of it are found at a little distance from shore, and at depths not exceeding 300 feet. On loamy bottom large thickets of this plant take root, and a stem of the thickness of ordinary cord grows upward. At its top there is a pear-shaped balloon, which grows with the stem, and when it reaches the surface of the water it often measures 6 feet and more in length, with a diameter of 4 feet 6 inches. This balloon has, of course, an upward tendency, and keeps the stem growing until it floats on the surface of the water. From the top of this balloon a large tuft of strong, thick, spade-like leaves grows out, which originally are not more than 2 feet long, and which grow and split until from the balloon a roselike growth of from 50 to 65 feet in diameter covers the water. This gigantic weed grows in such quantities that near the shore large meadowlike islands are formed, which impede navigation. The natives of the Aleutian islands make manifold usage of this plant. From the strong dried stems they make rope 250 feet and more long, while balloons of this weed furnish them with large vessels after they are dried, the smaller ones being used in their boats to bail out water. The long leaves, after being dried, are cut into narrow strips and used for wickerwork, the making of baskets and similar furniture.

THE Utah pioneer farmers were the first to prove the advantages of irrigation in the arid regions. The increased products make bountiful returns for the extra labor involved, fully compensating for all trouble expended. There are no almanac farmers in Utah. While the farmer in the East is praying for rain or lamenting his fate because of the lack of it, the Utah yeoman is calm and serene as a June morning in Zion, going from headgate to headgate and turning on the water. There are about 380,000 acres of land under cultivation in Utah, of which 315,000 are actually irrigated. Out of the 11,200 farms, about 10,000 depend upon irrigation, the balance being dry farms (above the irrigating canals) or stock ranges or ranches. The average irrigated farm consists of about 30 acres. There are only seven irrigated farms in the State of 640 acres and upward.—Inter-Mountain Industries.

WOMEN are less sensitive to pain than men, and this sensitiveness is less in early life, increases to the twenty-fourth year, and decreases after that. The higher classes are most sensitive and degenerates the least. The latter are found very obtuse to the sensation of pain. Endurance of pain varies between much broader limits in women than in men, reaching a maximum far beyond the masculine limit, possibly due to great "suggestibility" of the female sex. "General sensibility" reaches the highest point in the nineteenth year.



DURING 1896 British shipbuilders launched 1,326,822 tons, against 1,156,571 tons in 1895. Of that total the national dockyards turned out 71,970 tons, against 70,350 tons in 1895, and is the biggest output on record of the national workshops. Harland & Woolf of Belfast added 81,316 tons to the mercantile marine; at Newcastle Sir W. G. Armstrong & Co., 54,147 tons, with 67,770 i. h. p.; Sir William Gray & Co. of Hartlepool, 43,545 tons; and Connell & Co. of Scotstoun, 40,864 tons.

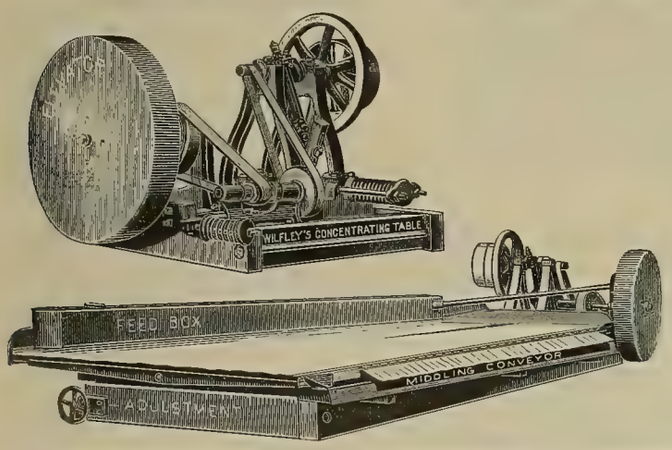
UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.



For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

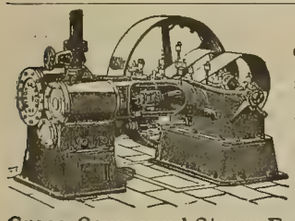
The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

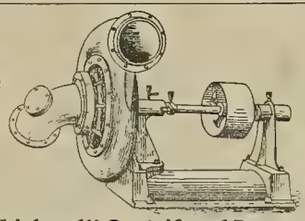
The Mine and Smelter Supply Co.,

. . . DENVER, COLORADO, . . .



ARE SOLE AGENTS FOR THE

Wilfley Concentrating Table,



And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Anyone can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; M. E. Smith Concentrator, Golden, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; W. H. Bellows, Boyd Mill, Boulder, Col.; H. E. Woods, Denver, Col.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession. ❖ PRICE, $450.00.

Coast Industrial Notes.

—The Northern Pacific Coal Company is now shipping 1000 tons of coal a month to Rossland mines.

—At San Pedro harbor, Cal., borings into the bottom about the mouth of the inner harbor, and also about the outer harbor, are being made under orders of the Harbor Board.

—The Oregon Short Line & Utah Northern Railway property was sold to the reorganization committee last week at Salt Lake. The total sum bid at the three sales was $7,185,000.

—The Tutthill Water Wheel Company has been incorporated by S. J. and C. A. Tutthill, C. E. Chamberlain, C. S. Booth and E. B. Norton. The capital stock is $300,000, of which $100,020 has been subscribed.

—The three mills of the Puget Lumber Company have a combined daily capacity of 450,000 feet of lumber. The mill at Port Gamble, Wash., turns out an average of 225,000 feet daily, and has cut as high as 350,000 feet in a ten-hour run.

—The California Railway of Oakland has at last perfected the only first-class electric locomotive upon the Pacific Coast, which is now in operation between Oakland and the quarry. The locomotive will take a train of ten loaded cars over a 3 per cent grade.

—Preparations are being made by the S. F. & S. J. railroad people to begin work in the extension of their line beyond Fresno toward Bakersfield. The right of way has been secured and preparations are being made to grade and track 100 miles or more. In three or four weeks 300 or 400 men will be put to work on the extension, and it is expected to have the work finished by July 1st.

—From Oct. 6 to Dec. 17, '96—from a month before to a little over a month after election—the deposits of the national banks of Seattle and Tacoma and the four national and one private bank in Spokane increased 19 per cent. In October the total deposits of these six Seattle, five Spokane and two Tacoma banks were $4,336,973. On December 17th they were $5,147,356—an increase of $810,383.

—The Northern Pacific Railway Company has purchased the Cœur d'Alene Railway and Navigation Company's property, which was sold at auction under mortgage foreclosure by J. P. M. Richards, special master at Wallace, Idaho. The price paid was $220,000. It included the narrow-gauge railroad from Mission to Wallace and the line of steamers which ply between Mission and Cœur d'Alene City.

—Pennsylvania millmen project an iron and steel plant at Port Angeles, Wash., to cover thirty acres and cost $1,500,000. Stock is said to be taken up by workmen employed in mills located at Braddock, Duquesne, Homestead, McKeesport, Turtle Creek, Wilmerding, Pittsburg and Allegheny. The alleged intent is to employ 2000 men. The company is reported to have secured 600 acres of iron ore land and 1000 acres of coal land.

—Articles of incorporation have been filed in Wyoming of the Wyoming & Northwestern Railroad Company, which proposes building a line of railway westward from Casper through Natrona, Fremont and Uinta counties to the Wyoming line and thence to the Pacific coast by way of Salt Lake City. The capital stock is $6,000,000. The offices of the company are at Casper, New York and London. The incorporators are Englishmen named Thomas S. Moffatt, Reuben Hatch and Thomas J. Brown, the latter being the American agent of the British-American Exchange Association.

Recently Declared Mining Dividends.

Little Jessie, Arizona, $4000, payable January 14.

Anchoria-Leland, Colorado, $6000, payable January 15.

Le Roi, British Columbia, $25,000 payable January 15.

South Swansea, Tintic, Utah, $5000, payable January 11.

Whitewater Mining Co., Slocan, B. C., $24,000, payable January 5.

Silver King, Utah, $37,500, payable January 20. This is a total of $862,500 to date.

Galena, Deep Creek, Utah, $5000, payable January 11. This is a total of $71,000 to date.

There are seventy mining companies in the United States and British Columbia which paid an aggregate of $14,734,500 in dividends last year. The Calumet & Hecla, on Lake Superior, leads with $2,500,000, followed by the Anaconda with $2,225,000, the Boston & Montana $1,500,000, and the Quincy $1,000,000. Two paid $500,000 and $600,000, respectively, the other sums ranging from $1000 to $500,000.

On Jan. 11th the Calumet and Hecla Mining Company crossed the 100 mark by announcing a $5 regular dividend and $10 extra, the largest dividend ever declared in the history of the corporation at one time and the first extra. Both dividends are made payable Feb. 10th to stockholders of Jan. 13th, and together they call for the disbursement of $1,500,000, making an aggregate of $48,350,000 that the company has paid in dividends since it was organized.

Recent California Mining Incorporations.

Pioneer G. M. Co., San Francisco; capital stock, $100,000—$89,500 subscribed; W. M. Smith, C. Hohn, S. B. and F. B. Peterson, J. M. Hartman.

Shirlock Power and Mining Co., Mariposa; capital stock, $250,000—$200,000 subscribed; J. F. Hays, W. A. Stevers, W. H. Heitzig, M. E. and J. Green, of Fresno.

War Eagle M. & M. Co., San Francisco; capital stock, $100,000—$40,000 subscribed; B. W. Haines, R. Barnett, W. R. and J. H. Lewis, San Francisco.

Chowchilla G. M. Co., Oakland; capital stock, $1,000,000—$485,000 subscribed: D. M. Tomblin, B. W. Rogers, B. F. Hand, E. L. Knowlton, E. A. White.

Personal.

RANDALL HUNT of San Francisco has been appointed engineer of the Harbor Board which is investigating San Pedro and Santa Monica harbors.

SAMUEL CONNORS of Grass Valley, who has been in South Africa for a number of years and erected seven of the largest quartz mills there, has returned.

BARON DE MARIAS, a mining engineer, who has been sent out by the French Government to look into mining and milling properties in America, has been during the past week in Amador county.

H. R. Cocker, of St. Paul, Minn., succeeds Bernard MacDonald in the presidency of the American Mining and Development Co. of Butte, Montana, the latter having resigned to devote his exclusive attention to the position of consulting engineer of that company.

MR. B. HUNT, manager of the Brodie cyanide mill in Cripple Creek district, goes to San Francisco to take charge of the business of the Gold and Silver Extraction Company of America, in California, succeeding P. George Gow, who becomes manager for the Jumper Gold Syndicate of California. Paul R. Forbes becomes manager of the Brodie mill.

Obituary.

ALEXIS JANIN died in this city of heart disease last Wednesday. Few men have done as much for mining and metallurgy in the West as Alexis Janin and his brothers Louis and Henry. He was splendidly equipped by nature and education for his work. Mr. Janin was born in New Orleans in 1846. He was educated abroad, taking his first degree at Sorbonne, in Paris. Later he went to Freiberg, where the State examinations were taken by Mr. Janin and passed with so much credit as to entitle him to a professorship had he chosen to remain. His work on the Comstock in milling, and especially in working the ores and slimes, did much to make the methods there what they are. For more than twenty years past Mr. Janin had done nothing but special work for mines in Mexico, Central America and South America and the Western States and Territories. Having devoted more than twenty years of study to the amalgamation of ores, he probably knew more about that process than any other engineer. He was an accepted authority on all matters pertaining to ores and their working. It is to be regretted that he had not finished a work he was preparing before his death on working ores.

COLORADO'S GOLD FIELDS.

Millions Upon Millions of Dollars in Gold Have Been Added to the World's Wealth.

It is a well-known fact that the richest and most famous gold mines in the known world are those of Colorado, many of which are paying to fortunate investors millions of dollars annually in dividends. Some shrewd persons who invested only a few dollars are now receiving hundreds and thousands in profits, and, judging from present indications, there are more desirable chances to invest just now than ever before. New mines are discovered daily and old ones strike richer veins of gold.

In order to meet the great demand for reliable information about mines and mining camps, one of Denver's oldest and best known publishers has just issued a handsomely illustrated book accurately describing every mining camp in the entire State of Colorado, giving scores of truthful photo-engravings of famous mines, mountains, cities, etc. Cripple Creek, the world's wonder, is fully described; also a correct map of the district. Narratives of how many poor people have become wealthy by judicious investments in gold mines, and sketches of former prospectors who are now fixed for life. Tells how to avoid unscrupulous brokers and sharpers. The volume has been carefully compiled by a disinterested author and every statement made is guaranteed to be true. All terms and phrases of miners fully explained; tables showing the State's production of gold and silver for 35 years past. The publisher will send by return mail a copy of the above great book upon receipt of 25c. (currency or stamps), which also includes a 3-months trial subscription to his big 56-column weekly family paper, the *Illustrated Weekly Sentinel* of Denver, Colorado (established 1-90). Clubs of 5 and 5 books, $1. The paper contains each week all the latest mining news and illustrations of Rocky mountain scenery, also true stories of love and adventure. Cut this out. Address as above and mention The Press when you write. It is reliable.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Hydraulic and River Miners Handling Boulders Can Easily Remove Them By Using

The Knox Patent Hydraulic Grapple.

A Great Mining Triumph.

Capt. J. R. DeLamar, of New York City, is one of the largest owners and workers of Gold Mines in the world. After the most careful investigation he purchased in August, 1895, two Griffin Mills, and his report is so remarkable as to demand the careful attention of every one interested in Gold Mining.

We give it in his own words.

NEW YORK, Jan. 9, 1896.

BRADLEY PULVERIZER CO. *Gentlemen*:—The two Griffin Mills have been in operation now for 90 days on the hardest rock, with the exception of corundum, that I have ever met during my mining life. They have taken the rock direct from the breaker, and they average about 20 tons to each machine, 40 mesh fine, without elevating or bolting. We simply put a ¼ mesh screen around the Griffin Mill, and the stuff comes out 40 mesh fine or over, which makes it an excellent pulp for leaching by cyanide or chlorination; therefore we have concluded to order **10 more Griffin Mills**. We have tried high-speed rolls and dry stamps, and after looking into the Huntington Dry Pulverizer, the Narod Pulverizer, the Stedman Pulverizer, the Frisbie Lucop, the Cook, and various other dry pulverizers, unhesitatingly recommend your Griffin Mill to any one.

Yours truly, (Signed) J. R. DELAMAR.

HOW 10 GRIFFIN MILLS WORK.

DELAMAR'S NEVADA GOLD MINING CO.,
SALT LAKE CITY, UTAH, Nov. 24, 1896.

BRADLEY PULVERIZER CO. *Gentlemen*:—In answer to your inquiry as to what the "Griffin Mill" is doing at our DeLamar Mill, DeLamar, Nevada, we beg to state that we often run 310 tons per day with 10 of your mills in operation, and on one occasion these 10 mills produced 408 tons in one day. I have no hesitancy in stating that they will regularly produce at least 30 tons per day each on our ore, which is extremely and unusually hard.

Yours very truly, H. A. COHEN, *General Manager*.

These strong letters coming from such representative men are conclusive evidence that we are right in claiming that the "Griffin Mill" will produce a larger amount of finer pulp at less cost than any other stamp or pulverizer made.

Let us send you a free copy of our illustrated pamphlet, which will tell you all about the Mill and bring to you other evidence of its great achievements.

BRADLEY PULVERIZER CO., 92 State St., Boston, Mass.

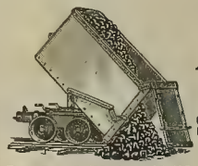
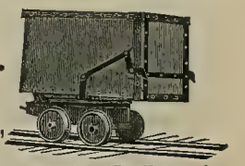
PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.
1607-8 Manhattan Building, Chicago, Illinois.





The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

BURN OIL, CHEAPER THAN COAL.

Tintic Mining District, UTAH.

The Tintic Mining District lies eighty-five miles south of Salt Lake City on the Rio Grande Western Railway, and is, as shown by the records of 1895 and so far in the present year, the greatest mineral producing district in Utah.

The names of the great bonanzas of Tintic, the Mammoth, Centennial-Eureka, Bullion-Beck, Eureka Hill and Gemini are recognized everywhere that the mining industry is known. The four former have each a record exceeding $1,000,000 in dividends and the latter of over $600,000.

Until within the last two or three years no adequate means of reduction of Tintic ores was in operation in the district and the production of the mines was limited to those ores sufficiently rich to be shipped to the smelters for treatment, but this has been changed by the erection of immense combination and concentration milling plants which can work at a profit those immense deposits of low grade ores which fill all the producing mines of the district. Four of these mills are in active operation, and three others will undoubtedly be erected within the next year.

The ores of Tintic are greatly diversified in character. The principal metals produced are gold, silver, copper and lead. In silver production Tintic leads the State, while in the production of gold it stands second on the list. Beside the big bonanzas above mentioned there are some twenty-five or more properties that now and in the past have been producing mines, and to these may be added a score of others which have paid for their development by their products, and upon which the recent rivival of the mining industry has had the effect of a recommencement of operations.

Tintic has four thriving towns—Eureka, the business center of the district, with a population of 2,500; Mammoth, population 1,000; Robinson and Silver City, 500 each, all of which offer great inducements for investments in a business way.

At the base of the foot hills only a few miles away, is a valley of 25,000 acres of choice fruit and garden lands, watered by the Mt. Nebo Land and Irrigation Company.

As to the future of Tintic, it is no exaggeration to say that it possesses the brightest prospects of any mining district in Utah, and offers to the prospective inventor opportunities which cannot be excelled.

The Rio Grande Western Railway has a double daily train service between Salt Lake City and the Tintic Mining District. For further particulars apply to F. A. WADLEIGH, General Passenger Agent, Salt Lake City.

VULCAN ROPEWAY

— WITH —

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 14, 1897.

General trade is steadily improving. Compared with the corresponding time last year, it shows a larger volume of goods going out. This, no doubt, is due to the small stocks carried by the trade with assortments badly broken, which call for filling in. The tariff question continues a disturbing factor, which is being severely felt in quite a number of lines. Iron workers report the outlook more promising than for years; but close competition with the East reduces the margin of profit. It is the belief that there will be a free demand for structural material for building bridge construction and other purposes. The promise of large crops will create a demand for agricultural implements, while renewed activity in mining will create a good demand for mining machinery.

The local money market is very dull, with funds steadily increasing in the absence of a demand and disbursed money coming back for investment. The heavy disbursements being made for export products unties large sums of money each week. The export clearances of products and general merchandise average about $900,000 a week. This is an important item and has weight in local finances and exchange market. The East continues to report a plethora of funds with the reserve largely increased. Money is offered in New York at the rate of 1½ per cent a year on Call loans. A leading New York financial paper just to hand says: The trade balance in favor of this country amounts to over $300,000,000, which represents a very handsome sum to the credit of the United States, even after allowing for freight and other items which have to be deducted. The mines in this country are yielding over $46,000,000 of gold and $36,000,000 of silver, with the gold production increasing at the rate of about $7,000,000 a year. The country is getting good prices for wheat, with a market for the exportable surplus and there is an immense crop of corn awaiting movement. Liquidation has been thorough and it is to be hoped that wiser methods of legislation will prevail.

New York Silver Prices.

NEW YORK, Jan. 14.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 11-16	64¾
Saturday	29 11-16	64¾
Monday	29 11-16	64¾
Tuesday	29 11-16	64¾
Wednesday	29 11-16	64¾
Thursday	29 11-16	64¾

	Copper.	Lead.	Iron.	Tin.
Friday	11 50	3 02½	11 00@13 00	13 05
Saturday	11 55	3 02½	11 00@13 00	13 10
Monday	11 60	3 02½	11 00@13 00	13 10
Tuesday	11 65	3 02½	11 00@13 00	13 10
Wednesday	11 67½	3 02½	11 00@13 00	13 10

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	£4.85½
London Merchants	£4.84½
London Sight Bankers	£4.88¼
Refined Silver, per oz., 1000 fine	64¾
Mexican Dollars	51¾@52¼

SILVER.—The market has held to steady prices throughout the week. Our advices from the East are to the effect that the export movement is quite free, with the outlook favorable for an increase instead of a decrease after the year had been well entered. Improving business abroad is a factor in its favor.

MEXICAN DOLLARS.—The market is steady at the reduced quotations. The inquiry from China is said to be fairly good.

ANTIMONY.—Our market is quoted at 7½@8c in a jobbing way. New York mail advices quote 7¼c for Cookson's, 6¼@6¾c for Hallett's and 6½c for Japanese.

QUICKSILVER.—The year opens with a fair call for the season.

The market is quoted as follows:

Domestic trade, per flask	$6 40

For export, quotations are nominal but less than for home.

COPPER.—As stated by the MINING AND SCIENTIFIC PRESS would be the case, the markets at the East and abroad are strong and higher. The stocks are not large, while the consumption is steadily increasing.

CURRENT COPPER STATISTICS.

In their copper circular of the 7th inst. D. Houston & Co. of New York say: There has been a gradual transition of the market from a condition of previous dullness to one of great interest and positive strength. Since the latter part of December prices have advanced from about 11¼ to the present quotation of 11⅝ to 11¾ for Lake Superior copper. During the past month a leading Lake company sold considerable copper at 11½, and another producer sold a round lot last week at 11¼ for January delivery. Inquiries have increased lately, but holders have been reluctant to accept further recent orders at 11⅝, and the trend of values is in an upward direction. There is every indication that the market is now at bottom, and the new year opens with a much stronger feeling and increasingly hopeful expectations in copper circles regarding this metal. The very best of reasons for the improved features is found in the relation which the important factors of supply and demand at present sustain to the market. They are so happily adjusted that they cannot fail to exert any other than a favorable influence. Complete returns of production will not be ready before the middle of the present month, but taking the output for the first eleven months of the year, and estimating the December product at the same average, the total copper production for 1896 would appear as follows:

	Tons.
United States production, January 1 to November 30, 1896	186,275
United States production, December, 1896 (estimated)	16,934
Total for 1896 in fine copper	203,209

	Tons.
United States exports of copper, January 1 to November 30, 1896, per Copper Association's returns	112,625
United States exports of copper, December, 1896, per metal Exchange returns	13,288
Total exports, 1896	125,913
For home consumption	77,296

Stocks carried over January 1, 1896, must also have been drawn upon, so that domestic consumption was probably larger than represented by the above figures.

The enormous exports the past year are without parallel in the whole history of copper and comprise about 61 per cent of the total United States production for 1896. Although American production will show an approximate increase of 32,142 tons during last year, or about 18¾ per cent over previous year, exports increased about 94½ per cent compared with 1895. The exports of copper from this country for 1896 are equivalent to the entire annual production last year of the Anaconda, Calumet & Hecla, Boston & Montana mines, and possibly the Quincy mine also. Domestic consumption last year was much below normal figures, owing to adverse business conditions, but with the home demand up to the full limit of its natural volume is it not probable that the supply of copper would be altogether inadequate to the world's needs, notwithstanding the maximum production attained in 1896?

Current production has not only been well absorbed, but stocks have undergone serious depletion during the past twelve months. The year 1897 opens with brightening prospects for American manufacturers, and its advent finds them preparing for trade on a much larger scale. With the expansion of business there should be a constantly growing demand for copper, both in this country and Europe, to meet the extended introduction of electrical projects and the more extensive use of this metal for other purposes. Diminished stocks will have to be replenished, and with the anticipation of reasonably higher prices between now and spring, the necessity and incentive for purchasing will no doubt operate to produce much greater activity. Indications on the horizon foreshadow the return of much better times for copper and copper mining shares, and the peculiarly excellent position of the metal certainly furnishes a solid basis for a vigorous and active movement in both.

The foreign situation on copper is remarkably strong. The demand throughout Europe has grown wonderfully the past year and the prospect for its continuance is excellent. Notwithstanding the enormous imports of copper into Europe, deliveries have exceeded the total supplies going forward, and European visible supply of copper January 1, 1897, was 10,890 tons less than on January 1, 1896, and 19,783 tons less than on January 1, 1895.

Consumption of copper in England from January 1 to December 1, 1896, according to carefully prepared estimates, was at the rate of 7306 tons per month, and exceeded the total European production during the same period by 1683 tons. The increase in British consumption of copper during the first eleven months of last year was at the rate of 40 per cent compared with that of 1895. German consumption had increased up to last returns 35 per cent, and that of France 24 per cent. The consumption in these three countries is estimated at the rate of 394,007,040 pounds per annum, or an increase of 103,000,000 pounds over 1895. In addition thereto, there was exported to other European countries from the United States, during the first ten months of 1896, a total of 91,032,515 pounds of fine copper, or 41,379,676 pounds more than was shipped during the corresponding period in 1895 for the same destination. The position of copper in Europe and the unprecedented foreign demand is altogether phenomenal. Stocks of Chili copper in Liverpool and Swansea have been reduced 15,647 tons during the past year.

The Anaconda Copper Mining Co. has issued its first annual report for the fiscal year ending June 30, 1896. It is an interesting document, and the exhibit presented by its balance sheet reveals the gigantic character of this famous property. The report states that during the year 107,036,697 pounds of fine copper were shipped from Anaconda in the form of electrolytic bars, anodes, or converter bars. The sales during the same period amounted to 85,476,795 pounds of fine copper, 4,498,560 ounces of silver and 14,384 fine ounces of gold. An analysis of the report brings out the fact of the high cost to the company of its copper product, and that the profits accrue principally, if not entirely, from the precious metals and subsidiary departments. Items of expenditures give a good idea of the cost of the copper produced by the Anaconda, and summarizing the report of the company, the copper itself may be set down as a by product. In round numbers the accounts show a profit of about $4,000,000 as a result of the operations of the company for the year. This is equivalent to a profit of $3 13-100 per ton of ore. The electrolytic refining plant at Anaconda has been doubled, and has now a capacity, when worked up to the full limit of 6,000,000 pounds of copper per month. The initial report of this celebrated mine certainly furnishes ample ground for anticipating higher prices for copper. The shares are now quoted in London at £6 2s 6d.

Rio Tinto Company, limited, have taken steps to divide the existing 325,000 shares of £10 each in the company's capital into two shares of £5 each, to be called preference shares and ordinary shares. The proposition was unanimously agreed to last month, and the division is to be made on the 15th of May, 1897, but the net profits of the company earned on or after January 1 are to be appropriated as if such division had taken place on that date. Since the new regime the shares touched £26 and now quote £25 17s 6d.

The Calumet & Hecla Mining Co. shares have advanced to the highest price ever recorded, and sold on the 6th inst. at $345.

The Franklin Mining Co's. production of copper for the year 1896 is (including the estimate for December) 2,747,861 pounds. There was no product in January, 1896, owing to the fire.

The latest advices from the Franklin Junior are: The big crosscut is going on very well and good progress is made. At the Kearsarge shaft a depth of 50 feet from the surface has been reached, the lode showing copper occasionally. At the Pewabic lode, the drift south shows fairly well in copper. The north drift in this level is now very good, and a good deal of high-grade stamp rock is in sight. The shaft is below the sixth level and is showing quite well. The prospect in this shaft is quite encouraging. In November last 604 tons of rock taken from workings on the Pewabic lode were stamped, and yielded 20,555 pounds of mineral, equal to 1 7-10 per cent.

The production of the Quincy Mining Co. for the year 1896 will be about 16,750,000 pounds fine copper, against 16,304,721 pounds in 1895.

The local market is quoted as follows:

Ingot, jobbing	14¼@—
Ingot, wholesale	13½@—
Sheet copper	17 @—
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

LEAD.—The market is practically unchanged. The East reports that the demand is not active, while offerings are not free.

Pig	—	@	3 75
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a moderate demand.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " " "	1 45
Buck, Balls and Chilled, do, " " "	1 45

BORAX.—Shipments to the East are fair. The market is steady.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

IRON.—The market is unsettled. While lower prices are not quoted yet, it is known that concessions can be secured. The East reports weak markets, with prices for pig more or less unsettled.

COAL.—The market continues in sellers' favor. The low charters at this port for deep-sea vessels will operate against Australia shipments here for two or three months.

TIN.—The market is firmer in sympathy with the East, where slightly higher prices prevail.

Pig, per lb	14¼c@ —
Plate, I C coke, heavy, per box	— @$4 05
" " " light, " "	— @ 3 95

POWDER.—The demand is fair.

The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

Mining Share Market.

SAN FRANCISCO, Jan. 14, 1897.

The market has been irregularly active the past week, with dealing chiefly in Gold Hill shares under the lead of Challenge. The outside public are slow in taking hold, confining transactions to chippers and room traders. Without new blood can be gotten into the game, it looks very much as if lower prices will rule. It is barely possible that two or more outside pools may combine and bull the market so as to try and unload at higher prices. If they do this it will prove a failure unless more ore is shown up than has been for many months past. Victims are getting quite scarce, and those now willing to be bled have comparatively little money; but it may be that the market is being worked in the interest of a strong combine that wants shares and not money. If this is so, then it will be a freeze-out game, plenty of promises, very little ore, but plenty of assessments. It is asserted that if it were desired to show up considerable ore it could be done at several places. It is stated that in Alpha this can be done whenever desired. Over twenty years ago Con. Imperial paid dividends from ore extracted from the Red or West lode, and nine years ago Confidence did the same thing. Now that Alpha has struck the lode it can do likewise. It looks very much as if the powers that be do not wish to uncover the ore, which, if so, gives color to the belief in certain well-informed quarters that it is shares that is wanted. Experience has taught that when considerable ore was shown up the public would come in as buyers and not as sellers. With the promise of ore, but not carried out, followed by assessments and a low, dragging market, outsiders have been made to let go their holdings. After securing all the shares desired, a good-sized deal was engineered on a bona fide development of ore found years before, but kept in the background for an opportune time. On the ore showing, insiders

succeeded in unloading at around the highest prices of the deal. This has been the history of the Comstock mining share market and will continue to be so long as outsiders can be induced to play at the game. It cannot be denied that considerable work is being done in the mines, considering the small number of miners employed, but it seems that the work is driven to within a short distance of where ore can be found, when it is either stopped or turned to one side.

From the Brunswick lode there come reports of streaks of high-grade ore being cut in Occidental. If these should widen it will create renewed interest in the shares of that mine. In Chollar they are preparing to open up the 500-foot level. They are extracting six to seven tons of ore a day from the work on the 400-foot, 300-foot, 200-foot levels They milled 232 tons of ore which returned $7,884 60 in gold and four bars of fine silver weighing 3823 ounces. This gives a yield of nearly $43 to the ton, which ought to more than pay expenses of the company. All work has been discontinued by Con. Virginia, Best & Belcher and Gould & Curry in the tunnel so as to confine operations to the 800-foot level which is 120 feet deeper than the tunnel level. The south drift on this level is being run jointly by Best & Be cher and Gould & Curry. The material passed through is reported to have been quite favorable.

Interest in the Comstock mines centers in the work that is being done in the Gold Hill groups; but, as yet, official letters do not warrant any excitement. In Alta the work continues of a kill-time character and how not to strike ore. In Overman they raise about one ton of ore a day, but the grade is higher, which is some comfort to assessment payers. Official letters from Belcher and Seg. Belcher are still silent as to where work is being done. A few tons of ore are being raised. Work has been resumed in Yellow Jacket, but on what level and in what direction we are not able to learn. It may be that it is towards Challenge, and that it is to this that the strength in the Challenge shares is due. A few tons of ore are raised each week by Confidence. Work is progressing more rapidly in the Challenge-Confidence-Con. Imperial joint west crossdrift. It is confidently asserted that this crossdrift will strike quite a body of ore, mostly gold, before thirty days pass. In Alpha they report low-grade quartz to the west. This causes many to believe they are not ready to show up the high-grade ore known to be near where they are said to be working. Work has been resumed in Bullion. It is said that when the long west crossdrift was stopped the general formation of the ground had improved very much for the better. In Potosi and Chollar no work is being done. In Hale & Norcross they are raising from the 900-foot level. A few tons of fair-grade ore were extracted. In Savage they are working on the 500-foot, 750-foot and 850-foot levels. A few tons of ore were saved last week. Work is continued by Best & Belcher and Gould & Curry on their joint east crossdrift. In Con. Virginia they are still exploiting the 1000-foot, 1650-foot and 1750-foot levels. Nothing of special interest has been developed by the work. In Ophir they are still killing time on the central tunnel and 1000-foot level. In Mexican work is confined to the 2000-foot level towards the west. In Union, Sierra Nevada, Utah and Andes the work is the same as has been heretofore reported.

Commercial Paragraphs.

THE management of the Dixon Drill Company at Denver, Col., are increasing their facilities for manufacturing the machine. They feel that they have reached a degree of proficiency in the machine which fully warrants this.

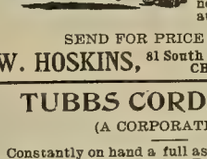
MCFARLANE & Co. of Denver and Central City, Col., are building two mills in Arizona—one of ten stamps near Nogales for the World's Fair Mining Company and the other of forty stamps near Kingman for the Excelsior Mining Company. Both are of the pan-amalgamation type.

THE Edward P. Allis Company of Milwaukee, Wis., has recently shipped considerable machinery to South Africa—three cross-compound direct-connected engines of 1000 H. P. each, to be used for electric power to drive pumps and hoists. Each engine weighs 100 tons. The Allis Company will shortly make further shipment to South Africa of three direct-acting hoisting engines weighing 200 tons apiece.

The Wilfley Concentrating Table.

The Wilfley Concentrating Table, a cut of which may be found in the advertisement of the Mine and Smelter Supply Company of Denver, consists of a flat table, 7x16 feet, resting on rollers, and is operated by an eccentric, giving a jerking motion, which carries heavy material to bottom of bed, then forward to head end of table. The pulp is fed through a feed box extending from end to end. This box is divided in such a way as to feed pulp at one end and clean water at end where concentrates pass off, resulting in a clean heading, so that operator can see at a glance what table is doing. Another good feature of this mode of feeding is that all material is kept continually under water and never exposed to the air. A simple experiment may be made with ores to show result of exposure to air. Take some pulp and pan it down until you can string the concentrates out, then tip pan back until these are exposed to air a few seconds, then bring water up on them slowly; the result with most ores which carry any copper, and often with iron and galena ores, is that a quantity will come to surface of water, and this is usually very rich material. It is nearly always stated that these are slimes, but it is not the case, as a screen will readily show, and careful consideration will convince any mill man that with belt, bumping, or in fact any table but the Wilfley, the losses in a day must be very serious. Of the Wilfley it may be said that all this material is easily saved. The silica passes across table (it being slightly inclined) and off at the side, in doing which it passes over cleats which are about ½ inch at tail end of table and taper to a point toward head end, the result being that coarse silica passes off first; then as material is jerked forward and upward upper end fine silica rises to surface and is carried off next. In this way the table acts as a sizer to a certain extent. If ore is put on a table or into any receptacle and thoroughly shaken, the coarse and fine concentrates and fine silica will go to the bottom, and the difficulty experienced in concentrating is to remove fine silica without large losses, hence a large percentage of silica accompanying concentrates is usually fine.

THE OVERLAND LIMITED, VIA UNION PACIFIC.



Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Ogden and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner ..... 600, f. o. b.

Smuggler-Union Mine, Telluride, Colo.

Herewith is illustrated Pandora, Colo., the lower terminal of a tramway from the Smuggler-Union, claimed to be the biggest silver-gold mine in the State of Colorado, for which we are indebted to the courtesy of that enterprising paper, the Telluride, Colo., *Journal*. A remarkable feature of the Smuggler-Union is the continuity and regularity of its vein, which from Canyon Creek, Ouray Co., cuts southeasterly through a mountainous country a distance of four miles into San Miguel Co., and is reported to carry pay ore for 1½ miles, the vein being two to ten feet in width.

A remarkable feature, as noted by the Journal, is the constant increase in gold values toward the south from the summit of the divide, and the corresponding decrease in silver value in the same direction. Where the vein crosses the divide at the extreme north end of the property, the gold value is hardly one-quarter that of the silver. The transition from silver to gold is almost constant until a mile south the vein practically becomes a gold lode.

The surface and underground development of the property would, in a straight line, cover twenty-three miles. The levels, 100 feet apart, are timbered with stulls, upon which lagging to support the waste produced in stoping is placed. The stull timbers are set into foot and hanging wall at right angle to the dip, and are about 14 feet long and as many inches in diameter. The work of exploitation is carried on by stripping in country rock on the hanging wall to a height of 7 feet, and then shooting down the vein in mass to be broken up and passed into chutes with little or no sorting. The mill is located at Pandora, connected with the mine workings by a tramway and by sidetrack with the Rio Grande Southern R. R. There are 50 stamps, 800 pounds, that drop 9 inches, 95 drops per minute.

In 1896 60,075 tons of milling ore and 6,255 tons of shipping ore were carried, and there has been taken up to the mine 17,685 mill timbers, 3,852,150 pounds coal and 16,276,158 pounds merchandise of all kinds.

The gross output for 1895 was 46,654 tons; for 1896, 65,575 tons. Three hundred and ten men are carried on the company's pay roll.

A long article on page 461 of the MINING AND SCIENTIFIC PRESS of Dec. 5th, 1896, gives so extended an account of this mine, its geology, etc., as to render unnecessary any further reference to it.

PANDORA AND LOWER TERMINAL OF SMUGGLER-UNION TRAMWAY.

Why Mines Offered Are Not Sold.

A great many of those who have mines to sell in this country claim that it is not true that there is much capital seeking investment in that direction. Yet there is a demand for all the mines that are offered in proper shape and at reasonable prices. The great trouble with those who have mines to sell—both owners and promoters—is that they do not have their properties opened up to show whether they are of real value or not; or, if they do, do not have them properly examined and sampled so as to give prospective purchasers some guarantee that they are more than mere prospects. This is especially noticeable in California, where as much is often asked for a prospect as for a developed mine, simply because the prospect is well located. They do not appreciate the fact that mining is being conducted on a more business-like basis than it was a decade ago.

A very small amount of work in developing will often make a showing that will enable a mine owner to ask enough to repay him many times over. True, a little work will often spoil a very good prospect, but the owner must learn that he has to deal with business men who are not buying prospects.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Pandora and Lower Terminal of Smuggler-Union Tramway, 65. Officers, Crew and Passengers on Board the Mischief, in Coal Harbor, Quatsino Sound; Keeper's House—Coal Croppings at Water's Edge, West Vancouver Commercial Co.; 12-Foot Coal Seam, Three Miles West of Coal Harbor; Coal Seam 5 Feet Wide and Tunnel, Natzenauchtum Creek, 68. Cedar Trees Back of Coal Harbor, Quatsino Sound; 12-Foot Coal Seam, Three Miles West of Coal Harbor, 69. Whirlpool Centrifugal Pump, 71. Giant Steel Frame Hangers, 73.

EDITORIAL.—Smuggler-Union Mine, Telluride, Colo.; Why Mines Offered Are Not Sold, 65. The Debris Question Reopened; The Proposed Secretaryship of Mines and Mining; The Legislative Committee's Bill; The Yield of Precious Metals; Unnecessary Heavy Expense to Investors, 66.

SCIENTIFIC PROGRESS.—Measuring the Earth; Determining of Carbon in Iron; Changes in the Elasticity of Iron, 73.

MECHANICAL PROGRESS.—Steel Frame Hangers; Lubricating Oils; Japanese Secret Alloys, 73.

ELECTRICAL PROGRESS.—Electric Traction Under Steam Railway Conditions; Extracting Ore by Magnetism; Electricity in Surgery, 74.

PRACTICAL INFORMATION.—Metric Conversion Table; The Deepest Bore-Hole; The Chief Consumer of Iron; To Pay for All Stock Killed by Them; A Normal Heart Very Rare; Per Cent of Death from Old Age; The Steel Umbrella Frame; Paper Instead of Wood, 74.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 76-77.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 86.

MISCELLANEOUS.—Concentrates, 67. Vancouver Island, 68. A Wonderful Calendar; Annual Report Upon Mining of the United Kingdom and Ireland; Their Sphere in Society; The Pacific Coast Oil Co.; The Skiff Mining Expert of the Lower Colorado River, 69. The Copper Mines of Nevada; Nevada City, Cal., District Geology, 70. Pump and Engine; Gold Product '94, '95, '96; A Modern Surveying Instrument; The Loss to the Farmer Through Debris, 71. The Solution and Precipitation of the Cyanide of Gold, 72. Subscribers and Advertisers, 75. Mineral Output for 1896, 76. Coast Industrial Notes; A Handsome Catalogue; Recent California Mining Incorporations; Recently Declared Mining Dividends; Personal, 79. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Farmers and Miners Uniting, 82. Commercial Paragraphs; Temperature and Rainfall, 87.

The Debris Question Reopened.

In this issue of the MINING AND SCIENTIFIC PRESS is published the third of a series of articles on the debris question, written by an engineer with a desire to simply give the data as to damage done and where the responsibility lies. Most of this data—in fact, nearly all—is taken from reports made on behalf of the farming interests or by the Federal or State Government engineers. The showing made is, therefore, about what would be made by any honest-minded man on the side of the farmers. To sum up briefly, they show:

First—Of the debris sent down into the Sacramento drainage system while hydraulic mining was carried on unrestrictedly, not over one-fifth could have come from the mines.

Second—Owing to the increased population in the foothills and mountains since that time, and consequent greater erosion, the amount of debris now coming down is about as great as it was while the mines were in operation, and consequently the evils then complained of are as great as ever.

Third—That had hydraulic mining not been discontinued some $75,000,000 would have been produced from the mines, and the loss in value of capital and income to the State has amounted to over $200,000,000.

Fourth—The direct damage caused by the debris making lands valueless, loss of product and loss to sympathetic industries has not amounted to over $50,000,000, and of this certainly not over one-fifth could be charged to the hydraulic miners.

Sixth—The maximum damage possible if all lands that lie low enough to be covered with debris should be destroyed would not exceed $40,000,000.

The Legislature will doubtless reappropriate $250,000 to be expended by the Debris Commissioner in conjunction with the U. S. Debris Commission in building restraining dams. This with the $250,000 appropriated by the Federal Government will give a total of $500,000. Besides this a bill providing for the appropriation of $300,000 under the direction of the Commissioner of Public Works and an auditing board for dredging the Sacramento river is in committee and is receiving the endorsement of both leading mining as well as farming members.

It would seem that without much trouble, now that good feeling has come between the two interests, something more could be done looking toward the reopening of hydraulic mines upon some basis that would not place such heavy burdens upon the miners.

The Proposed Secretaryship of Mines and Mining.

Senator Perkins has introduced in the United States Senate a concurrent resolution looking toward the establishment of a Secretaryship of Mines and Mining. The resolution, after reciting that the mining interests of the country have no clearly defined representation in the organization of the Government, and that it is desirable that there shall be gathered statistics and other information of value to the mining and related industries, and that it is desirable that all such work should be done by one organization, provides for the appointment of a commission, to consist of the Commissioner of the General Land Office, the Commissioner of Labor and the Director of the Geological Survey, "whose duty it shall be to determine the best method of ascertaining all the facts of general importance relating to mines and mining within the United States, whether by a mining bureau, a Secretary of Mines and Mining, a Commissioner of Mines, or a commission, and to report to the Secretary of the Interior for his examination and approval a bill providing means for securing all necessary information concerning mining and related industries within the United States."

This, it would seem, is a better method for a beginning than by the introduction of a bill at the present session which could not possibly be acted upon. As it is, if the commission receives assistance in its work from the miners themselves, the mining associations and other bodies interested as to the need of such a department, and makes an early report, there should be little trouble in bringing before Congress at the next session a statement of their needs in the case that should compel attention.

Those interested in the matter should now, as speedily as possible, take steps to urge upon the Senate and the House the passage of the resolution. Failure to pass it at this session will mean the loss of another year, at least, and as there is only little time left before the closing of this session there should be no delay.

It is to be hoped that something will be done to interest in this movement the great mining interests of the East. Should the coal, iron and other mining industries of the United States join with those engaged in producing the more precious minerals, it seems probable that whatever they would ask for, in reason, would be granted.

As to the personnel of the Commission proposed, while the present Commissioner of the Land Office would hardly be inclined to favor the proposed new department, if he is to be judged by his past attitude, much may be expected from the Director of the Geological Survey. The exceptionally good work that he has done while in that office, in making the survey of value, from an economic standpoint, to the mining industry, gives promise that his suggestions would be of value.

It would be well, now that the State Legislatures are in session in many of the States and Territories interested in mining, if they would pass resolutions urging upon Congress the passage of Senator Perkins' resolution.

The Legislative Committee's Bill.

The sub-committee of the Committee on Legislation of the California Miners' Association appointed to frame bills to be proposed to the Legislature as to mining laws has prepared a bill to supplement the Federal statutes in regard to the manner of locating mining claims and mill sites. This is to be submitted to the Executive Committee of the Miners' Association at a special meeting before it is sent to Sacramento.

The cause for a very general demand in this State for a bill on this subject has been the need for some legislation supplementing the Federal statutes, particularly as to what shall constitute a valid location as to marking, posting notices and recording them.

The most fruitful cause of litigation in this State has been the want of a State law on the subject. All other States and Territories have passed laws defining what marking shall be done in making locations, the recording of notices, etc. The Federal statute says simply that the location must be distinctly marked on the ground so that its boundaries may be readily traced.

The Supreme Court and other courts of this State have wrestled with this time and again, and have always complained that there is no State law for determining what shall constitute a proper marking.

Now comes the sub-committee of the California Miners' Association and propose that the State Legislature shall enact that the locator "must distinctly mark his location on the ground, so that its boundaries can be readily traced, and must file in the office of the County Recorder a certificate of location." Except as to the clause about recording notices, the enactment of this by the State would be a piece of supererogation. It might as well re-enact the Constitution of the United States. The rest of the proposed bill refers to details, some of which are of value, but it is altogether emasculated by the failure to provide for what is of first importance.

It cannot very well be claimed that the miner objects to having the State enact what marking shall be done, for in nearly every mining district formed in this State rules have been laid down as to how many stakes or other monuments should be erected. The number varies, of course, and so is the cause of confusion that it is desired should be remedied. Again, all the other States and Territories in which mining is conducted have adopted statutes in the case, and they have been found to work satisfactorily. There must be some sound reason as a basis when half a dozen States and Territories and a hundred mining districts will voluntarily do this. If there were any exceptions except the State of California, or even if the districts in California were exceptions, there might be good reason to claim that there are two sides to the question.

The Yield of Precious Metals.

On another page will be found the report of Wells, Fargo & Co. on the yield of precious metals, produced in the States and Territories west of the Missouri river, including British Columbia, in 1896. Without the valuable data gathered and supplied by this company annually, there would be much more difficulty in obtaining an approximate estimate of the product of these minerals than there is. Yet, until the other special sources of information have been heard from, these figures cannot be considered as at all final. One great advantage about them is that they are conservative. Larger outputs are claimed in nearly every district mentioned, but this is always the case. The total output of gold in the United States is placed at somewhat less than the last estimate of the Director of the Mint, which was $51,000,000, and that was less than others.

It is probable that the total will be considerably larger, for figures have come from reliable sources in South Dakota, Colorado, and California, for example, that go to show that Wells, Fargo & Co.'s returns are low. So it is with the yield of silver and other minerals in certain districts. Last year Wells, Fargo & Co. estimated the gold yield of California at considerably less than it was shown to be later by the mint and other returns, and so with Colorado. Considering that that report was published at the close of the year, however, and not after waiting months for returns, it was remarkable that it was so near correct.

The yield of British Columbia in gold and silver is put at $4,340,000. Last year it was less than $500,000. As there has gone into that province a large amount of machinery, and many large new mines are beginning to produce, while the big producers of last year promise to keep up their yield, it is likely that the output for 1897 will, as the newspapers of the Northwest claim, be double that of 1896.

INVESTORS will not go to the necessary heavy expense of having a mine examined without some proof that there is a strong probability that it is valuable. For this reason they refuse to examine many good properties that are not properly presented. Mine owners should learn that mines may be sold by samples of the ore bodies, to a certain extent, just as are wheat and other articles of commerce. Yet the average mine owner has a bad habit of taking samples that are of no value, and not only deceives himself, but others. He must learn that mines are not purchased nowadays without thorough examination and that he must present only such facts as may be substantiated.

Concentrates.

THE fee for an application for mineral entry or land for a mill site is $10.

THERE were forty-four mining locations recorded in Calaveras county, Cal., last week.

MINERS from Webb county, Mo., are being sent in considerable numbers to Leadville, Col.

THE output of British Columbia for 1896 is placed on rather conservative estimates at $5,000,000.

SI DROUILLARD AND N. T. BLAIR have located 3000 acres of placer ground in Esmeralda county, Nev.

THE Butte, Montana, Reduction Works have been rebuilt by W. A. Clark and now have a capacity of 500 tons daily.

ACCORDING to the Reno, Nev., *Gazette*, James Burke has discovered cinnabar in his lime mine at Steamboat.

ONE who located a mining claim on January 1, 1897, will have until Jan. 1, 1899, to do his assessment work.

IN Siskiyou county, Cal., last week, twenty locations of mining claims and four of water rights were recorded.

VICTOR, Colorado, is said to be the only town where business houses are torn down and moved off to make room for shaft houses.

AT a depth of 700 feet in the Park Regent mine in Colorado recently a piece of wood three feet long and three inches thick was found.

THERE is more activity in the Los Angeles oil wells than at any time last year, and the price has risen from 30 cents to 90 cents and $1.

THE properties of the Butte & Boston Company of Montana will be sold February 1st and will probably be bid in by the reorganization people.

THE Salt Lake *Tribune* states that a 4-foot vein of "soft clayish soil" has been struck near Grand Junction which assays $7 per ton in gold.

A MAN—not an old miner, but a politician—in Mojave county, Arizona, has discovered a copper mine, the ore from which he claims goes 140 per cent in copper.

THE Utica-Stickles mine, Calaveras county, and the Golden Cross mine, Hedges, San Diego county, Cal., have the same number of stamps in operation—140.

IT is claimed by the La Belle, New Mexico, *Crescent* that $500,000 will be spent in developing and fitting up placer mines in the neighborhood the coming year.

INSTEAD of building a branch from Mojave to Randsburg, Cal., the Southern Pacific has contented itself by putting on an opposition stage line and cutting rates.

JANUARY promises to be the banner month at Cripple Creek, Colo., as to the amount of production. It is claimed that it is apt to be double that of January of last year.

"MORE assessment work has been done in this district in '96 than ever before in one year," is the universal statement in every paper published in the mining districts.

A PETITION has been made to the Shasta county, Cal., board of supervisors for a franchise to construct and operate an electric railroad from Redding to Keswick, eight miles.

IT is reported that experts are again examining the De Lamar mines in Nevada for English capitalists. The owners last year refused an offer of $3,100,000 for the property.

BETWEEN Verde and Jerome, Arizona, there are over sixty men prospecting, most of them having gone there recently on account of the strike of a large ledge, assaying high in gold and silver.

MAJOR MYERS of Fort Jones, Cal., encourages a novel method of gold production by the statement that every native chicken killed in Siskiyou county has from 30 to 50 cents in gold in its crop.

A SEER, who claims to know, writes from Battle Creek, Mich., that he has positive assurance that the world will come to an end May 7, 1897. Very well. The most of us can get along just as well without it.

ARTICLES of incorporation have been filed in Denver of the Rocky Mountain Smelting Co., to be located at Florence, Col., with a capital of $750,000. Charles Foster, ex-Secretary of State, is one of the directors.

THE stockholders of the Cadmus Mining Company, most of whom are San Franciscans, have been invited to the mine at Grass Valley next Monday, when the new 10-stamp mill and other new machinery will be put in operation.

PREDICTIONS as to what will be the product of mining districts for 1897 are already the vogue in local papers. It would be interesting to sum them up and show that the product of the United States in gold will exceed $100,000,000 easily.

IN the California Legislature Assembly bill No. 30, regulating the mode of operating mines where blasting is being done, and providing for circulating copies of the act, has been recommended for passage by the Mines and Mining Committee.

IN the new Grand Encampment district, south of Rawlins, Wyoming, several local capitalists have located 4000 acres of placer ground and have secured all the unappropriated water in the north and south forks of the Grand Encampment creek.

MINING men everywhere should beware of proffered illustrated "write-ups" in "mining journals" for so much or so little per page. That questionable industry is more than usually active at present, and is being worked for all it is worth.

TESTS have been made of mineral that proved to be stream tin which came down from placers in Lemhi county, Idaho, where it was associated with gold, and is said to exist in paying quantities. Last fall some 500 pounds of it was saved for the purpose of testing.

WITHOUT detracting from the value of the defeat of the funding bill, it is to be said that a measure of more importance to the people of the State of California is the passage of the mineral land bill, which was marked for defeat last May, and is now up for passage in Congress.

AN examination of the Mercur mine in Utah is being made on behalf of Capt. J. B. De Lamar, who has an option on it for $1,500,000. It is understood that if the deal is closed the new owners will erect a mill with a capacity of 500 tons daily. At present 230 tons a day are being worked.

DURING the year 1895 about 1,250,000 barrels of oil were produced in California. Of this amount, very nearly 1,000,000 barrels were produced in Los Angeles county, and something less than 250,000 in Ventura county. It is probable that the yield for 1896 will not fall very far short of this amount.

NICKEL production in the United States in 1896, entirely from Canadian ores and matte, reached a total of 3,697,039 pounds—2,678,661 pounds in 1895. Of the production in 1896, metallic nickel amounted to 1,600,049 pounds, the remaining 2,096,890 pounds being in the form of oxide and sulphide.

SOME miners say that a mine named after a woman never proves to be a good one; that those which have the word "blue" or one of its compounds in their names are sure to be paying properties, and that those named for the stars are more likely to turn out rich than not. There are exceptions to this rule.

THE Salt Lake people who have taken hold of mines in the Meadow Lake district, in Sierra county, announced that work on a toll road from Truckee and Cisco will be commenced about May 1, and early in the spring a furnace will be erected in the old mining camp to reduce the ores to matte to be shipped to the smelters.

THE discovery of coal in a number of districts in Nevada give promise of a new industry for that State. The Nevada Central Railway Company has put eight men at work on a coal mine near Crum canyon, near Battle mountain, and it is said that the prospects are favorable for the development of extensive coal beds.

STATE MINE INSPECTOR SHOEMAKER, of Montana, recommends that the Legislature pass a law providing that all mines worked below a certain depth must have two means of exit. He also believes that the powers of the mine inspector should be so extended that he could order any needed improvement made at the expense of the mine owner or operator.

A CRISIS in the great strike in Leadville has at last been reached that brings a calamity that will affect both the strikers and the mine owners. The pumps that drain the mines on Carbonate hill have been pulled out and within a short time most of them will be flooded. Even if the strike should be settled now, it would be a long time before work could be resumed.

THE monthly output of the Baker City, Oregon, camp is placed by the *Spokesman-Review* at from $160,000 to $170,000, and it says that the principal producing mines are the Virtue, producing $30,000 a month; Bonanza, $18,000; E. & E., $25,000; North Pole, $15,000; White Grouse, $10,000; Baisley & Elkhorn, $10,000; Red Boy, $10,000. The shaft of the Virtue is now down 700 feet.

A BILL has been introduced in the Legislature by Senator Mahoney dealing with corporations. It provides that no assessment shall be levied by the trustees of a corporation without the concurrence of a majority of the shareholders and after a sworn statement of the officers as to the condition of the corporation and further that the owners of stock sold for assessment shall have the right to redeem within six months.

WALL STREET is reported to give credence to the statement that the Rothschilds have in the last four months bought up 127 silver mining claims in one district of New Mexico, ranging in price all the way from $1000 to $180,000, and asks: "Do these mighty European bankers intend to rehabilitate silver after they have depressed the price low enough to scoop in all the desirable mining properties?" Such a "scoop" is beyond even the financial resources of that great firm.

IT is claimed that the first application of electricity to mining was at Aspen, Colorado, July, 1888, when the first electric hoist in that region was started in the Veteran tunnel. It consisted of a 7½ H. P. street car motor of one of the earliest types which were then just coming into use. There are now in use at Aspen thirty motors varying from 1 H. P. to 120 and aggregating 622 H. P., which are used for hoisting, ventilating, drilling, mining mills, samplers and miscellaneous machinery.

PAPERS have been prepared for application to the Provincial Legislature of British Columbia for a charter to construct an electric railway from the international boundary line to Grand Forks, Anaconda and Greenwood, and thence to Rossland. An application will also be made to the Washington Legislature for a charter from Spokane to the international boundary line, and, if granted, work is to begin early in the spring. The power it is proposed to obtain from the falls of the Kettle river.

A MINERS' CONVENTION will be held at an early date at Perris, Cal., to which all people interested in mining in southern California are to be invited. There are two main objects stated—the first to get the Legislature to take action recognizing the mining district recorders as officials, empowering them to administer oaths, and dispensing with the recording of mining claims with the county recorders; and the second, to get the Interior Department to take steps to secure the passage of the mineral land bill now before Congress.

THE mine owners of British Columbia are not giving much encouragement to promoters of devious practices and wildcats. At a meeting of the Anaconda Club lately the secretary was instructed to give, gratis, full information to intending purchasers of stock of that district as to amount of work done, number of persons employed, and such other facts as may be in his power to give. Similar good work is being done by the newspapers of British Columbia and of Toronto and Montreal. Nothing could do so much to inspire the confidence of foreign capitalists.

THE Canadian tariff commission has been considering a plea from people from British Columbia for the free admission of mining tools and machinery. They assert that the mining industry is severely handicapped with an excessive and crushing tariff. Nearly every article entering into the operation of a mine, together with every article of consumption by the miner, is tariff-stricken. As a result of this, it is claimed, vast areas of low grade ores in nearly every section of Canada remain untouched. They claimed that by reducing the cost of production one hundred thousand men would be given employment between Cape Breton and Vancouver. Expectation that the coming year will bring the desired reduction has a tendency to limit the camp's present output. A number of developed mines could ship in large quantities, and derive a profit at existing charges, but their owners prefer to hold their ore bodies in reserve and wait for lower freight rates and smelting charges.

PROF. W. LINDGREN, of the United States Geological Survey, writes that the Nevada City folio, descriptive of the mines of Grass Valley and Nevada, published lately, and from which some description of the geology of the district has been published in the MINING AND SCIENTIFIC PRESS, is merely a condensed statement from the more extended report on the district, and which will be ready for distribution in about two months. A great many important questions are there treated in detail, which could only be briefly touched upon in the folio. The report will comprise 250 pages, with 24 plates.

SPOKANE papers are advocating the building of a smelter at that place. Vancouver is doing all it can to have a smelter built there. It is thought that one may be built at Northport, Wash., near the international line, on the road from Spokane to the Kootenay mines. Tacoma people are advocating a smelter at that point. Three smelters have been built in the Kootenays. The great advantage of the mining districts of the Northwest is railroad competition, which gives every encouragement to the opening up of new districts by giving facilities for shipping and incidentally of working the ores at low rates.

FROM the Slocan district alone in British Columbia it is claimed that forty-seven mines will ship ore during the year, and that the amount will aggregate nearly 50,000 tons. There is very little machinery in the district. The Noble Five is equipped with a 120-ton concentrator. The Slocan Star has a concentrator and a compressor plant. The Three Forks concentrator has a capacity of sixty tons, as has the Washington concentrator. This includes all of the machinery in the district except a few hoists. There is not a steam hoist in the Slocan. An estimate of the product of the Trail Creek district for 1897 places it at 350 tons a day.

IN New York Judges Lacombe and Wallace of the United States Circuit Court of Appeals, in a decision last week, classified natural gas as a mineral for all the purposes of the statutes and customs laws. This affirms the finding of the Circuit court of the district, which upheld the Board of General Appraisers' declaration "that the natural gas piped from Shirkstown, Canada, to Buffalo, N. Y., is not subject to duty because it is within the definition of 'crude minerals.'" Under section 4 of the McKinley tariff the collector of customs, however, assessed the imported gas at 10 per cent, holding that the gas is "a raw or manufactured article not enumerated or provided for."

THE syndicate operating the Corral Hollow coal mines, in Contra Costa county, and the Alameda and San Joaquin railroad, built to give them an outlet to Stockton, state that both properties will be in operation by February 1. The syndicate has invested in the railroad and mines $1,750,000. Over $750,000 was spent in buying the land at Corral Hollow and in partially developing the seven veins of coal found there. The remainder went into the railroad, which is thirty-six miles long; into mining machinery and additional development work. A shaft 1500 feet deep has been sunk and the machinery now placed at the mines will have a capacity of handling 1500 tons of coal a day.

REPRESENTATIVE ALLEN of Utah, has secured the passage through the House of Representatives of his bill to amend the Revised Statutes as to procedure in acquiring mineral land titles. The first object of the bill is to allow affidavits required under the land laws of the United States to be sworn to before an officer of the Government having a legal seal, thus saving loss and expense caused by requiring persons to go before the register and receiver of the land office for such a purpose. The second object of the bill is to establish rules of procedure in contest cases between claimants of mineral and agricultural lands. It provides that in case of contests as to the mineral or agricultural character of the land, testimony and proof may be taken under such notice and regulations as the Commissioner of the General Land Office may prescribe, concluding, "that wherever the land is proven to be within a well defined mineral belt, it shall be deemed prima facie evidence of the mineral character of said land."

IN the U. S. Senate last Wednesday Senator Perkins of this State introduced a concurrent resolution which sets forth that the mining interests have not a clearly defined representation in the Government, and for the collection of statistics and other information that will be of value to mining and related industries better plans are necessary. To accomplish this a plan is set forth in this form: *Resolved*, That a commission be and is hereby formed, consisting of the Commissioner of the General Land Office, the Commissioner of Labor and the Director of the Geological Surveys, whose duties shall be to determine the best method of ascertaining all the facts of general importance relating to mines and mining within the United States, whether by the Mining Bureau, the Secretary of Mines and Mining, the Commissioner of Mines or a commission, and to report to the Secretary of the Interior for his examination and approval a bill providing means for securing all the necessary information concerning mining and its related industries within the United States.

ACCORDING to a dispatch from Washington, Director Walcott of the United States Geological Survey has published a report upon the gold fields along the Alaskan coast. An expedition sent out last summer traversed the valley of the Yukon from the British boundary on the east to the mouth of the river on the west. All of the well-known placer deposits were examined, and the origin of the gold in them was traced to the quartz veins along the headwaters of the various streams entering the Yukon. Sufficient data were secured to establish the presence of a gold belt 300 miles in length in Alaska, which enters Alaska near the branch of Forty Mile creek and extends westward across the Yukon valley at the ramparts. Its further extent is unknown. It is the opinion of the geologist in charge of the expedition that it is entirely practicable to prosecute quartz mining throughout the year in this region. He also discovered along the river acres of rocks containing hard and bituminous coal. The director thinks in view of these facts that a reconnoissance report should be made of the gold and coal areas in order to secure an intelligent conception of the resources of the interior of Alaska, and for this purpose asks an immediate appropriation of $25,000.

Vancouver Island.

Written for the MINING AND SCIENTIFIC PRESS.

A good deal of interest has been directed to Vancouver island recently on account of its great mineral wealth, the island being rich in gold, copper and coal, particularly the latter. A large percentage of the coal used by the steamers running north, by the cities and towns in British Columbia and by the city of San Francisco comes from the coal mines at Nanaimo and Comox, the former having been worked for many years and having produced an enormous amount of very fine coal. The Comox coal fields are of more recent origin, but of excellent quality and great extent.

Vancouver island lies between north latitude 48.15° and 50.53°, and longitude 123.12° and 128.28° west from Greenwich. It is 260 miles long and its greatest width is 79 miles, but both on the north and on the south long canals or sounds run easterly far inland from the Pacific ocean, Alberni canal, for instance, running inland for 15 miles, with a depth of water ranging from 66 to 624 feet, and connected at its upper end by Stamps river to two lakes, the Klecoot and the Great Central lake, the latter being 18 miles long, 3 miles wide and having a depth of water ranging from 300 to 600 feet.

Pretty near the north end of the island is another of these great canals, called Quatsino sound, which, running a little north of east for 23 miles, makes a turn of nearly a semicircle and runs north of west for 25 miles farther. There are two arms; one, 17 miles from the entrance, runs south by east for 17 miles, and another, 22 miles from the mouth, runs 7 miles east. The depth of water is from 100 to 400 feet throughout. Twenty-two miles up the sound from the Pacific ocean is a beautiful harbor called Coal Harbor. It is 2000 feet wide at its mouth, widening out to a diameter of 4000 feet, with fine anchorage in water from 40 to 90 feet deep close to shore.

The waters here abound in salmon, halibut, herring, and the woods in bear, elk, deer and smaller game, while duck and geese are abundant in season.

The climate, under the influence of the warm current flowing from the west, is mild and agreeable. Snow sometimes falls to the depth of 1 foot, but melts off rapidly. The rainfall is seasonable and not excessive. Great forests of spruce, hemlock, fir and cedar cover this part of the island, the cedars reaching a large size.

The hills in the vicinity of Coal Harbor are not very high, generally not exceeding 100 feet, although on Vancouver island there are numerous mountains over 6000 feet in elevation, but the presence of such an abundance of timber and the undulating character of the ground has made the country difficult of exploration. While the south end of the island, as far as Alberni, is pretty well known, but little is known of the region in the vicinity of Quatsino sound.

Within the past year quite a number of Scandinavians have been attracted to this locality and are well pleased with it, believing in the future developments of its mineral wealth, the presence of plenty of fish, game and wood assuring them of a living. But until their arrival a few months ago this part of Vancouver island was inhabited only by Indian tribes, and at the time of the visit of Mr. A. S. Hallidie, in October, 1895, there were neither horses, cows, pigs, sheep nor chickens there.

The island at Quatsino sound is not very wide and deep water runs up into Coal Harbor, which is only 9 miles west of Hardy Bay, on the east coast, and where there is an excellent harbor, with good anchorage and plenty of water, Hardy Bay being situated on the inland passage from Puget sound to Alaska.

Across this narrow neck the Government is building a wagon road, which will connect Coal Harbor and Hardy Bay, and will give Coal Harbor splendid shipping facilities on both sides of the island, and when the great coal measures of this district are developed, will enable coal to be delivered directly on board the largest ocean ships at Coal Harbor on the west and Hardy Bay on the east of Vancouver island.

As early as 1872 Mr. John J. Landale, an English mining engineer, made an extensive examination of the coal and other minerals in the vicinity of Coal Harbor, and reported the coal field as covering 5000 acres and the amount of coal computed to exist, based upon his actual exploration, to be 33,000,000 tons, or 600,000 tons yearly for a period of fifty-five years. There are five seams, the thickness being 2 feet 8 inches, 3 feet 6 inches, 1 foot 10 inches, 2 feet 6 inches and 4 feet 6 inches, respectively.

Since then Mr. M. B. Silver has made further exploration and discovered fresh seams, one of which is 12 feet wide.

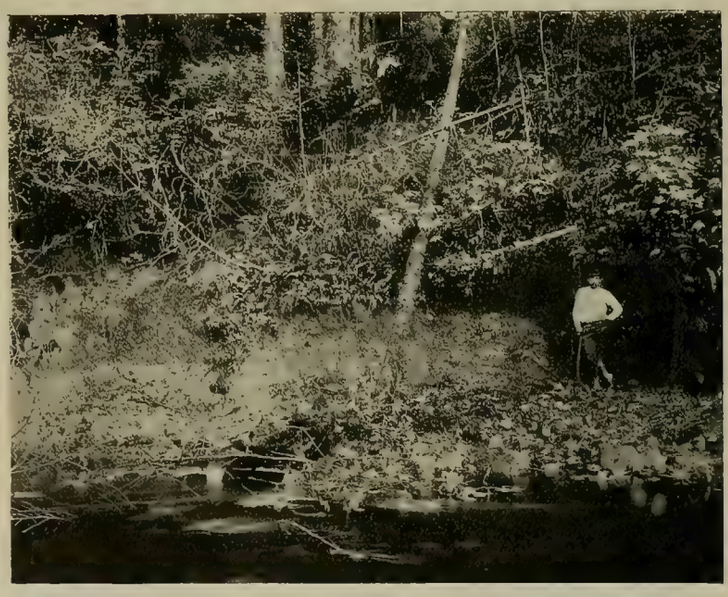
Mr. Landale reports analysis of these seams as containing:

Carbon	60 to 71
Hydrogen	5 to 8
Nitrogen	1.10 to 1.75
Oxygen	4.55 to 13
Sulphur	0.3 to 0.9
Ash	12.39 to 25

Mr. Robert Brown, in his paper on "Coal Fields of the North Pacific Coast," translation of Edinburgh Geological Society, 1868-9, gives an analysis of the coal of one of the above veins by Mr. G. C. Hoffman, as follows:

Hygroscopic Water	1.05
Volatile Combustible Matter	34.38
Fixed Carbon	54.01
Ash	10.56
Total	100.00

Mr. Landale reports also the presence of rich cop-



OFFICERS, CREW AND PASSENGERS ON BOARD THE MISCHIEF, IN COAL HARBOR, QUATSINO SOUND.

KEEPER'S HOUSE — COAL CROPPINGS AT WATER'S EDGE, WEST VANCOUVER COMMERCIAL CO.

12-FOOT COAL SEAM, THREE MILES WEST OF COAL HARBOR.

COAL SEAM 5 FEET WIDE AND TUNNEL, NATZENAUCHTUM CREEK.

per veins and numerous indications and outcroppings on this part of the island.

Very little attempt has been made to further develop this coal area, except that made by the West Vancouver Commercial Company with a small drill, but as the cores obtained were only ½ inch diameter they did not bring up sections intact.

All the streams carry float coal, and coal veins outcrop in a number of places on the shore near Coal Harbor, and the coal is and has been used by steamers visiting that locality since the British steamer Hecate got her coal there in 1870.

The waters and shore line of Quatsino sound are beautiful and romantic. With a good steamer it can be reached in 36 hours from Victoria, and will be a revelation to the tourist and hunter, as it surpasses in beauty Puget sound and has a water area of about 200 square miles.

Mr. Hallidie circumnavigated Vancouver island in the fall of 1895 on the sixty-ton steam schooner Mischief, going north from Victoria on the Pacific ocean side, passing around Cape Scott, the northern extremity of the island, and returning by the inland passage on the east side of Vancouver island, stopping at places en route, particularly at Quatsino sound, where he spent some days.

There are a great many points of interest to the geologist, botanist and general tourist, and innumerable inlets on the rugged west shore that cannot fail to interest those visiting that comparatively inaccessible and virgin country.

We give six views: Fig. 1, deck of steam schooner Mischief, with Mr. Hallidie sitting on a stool, with field-glasses in his hand, and the captain of the Mischief, Captain Foot, sitting on a box filling his pipe. Fig. 2, keeper's house West Vancouver Commercial Co., coal cropping of vein, 2½ feet wide, at water line. Fig. 3, coal croppings (12-foot vein) on the shore three miles west of Coal Harbor. Fig. 4, coal seam, 5 feet thick, and tunnel on Natzenauchtum creek, Coal Harbor. Fig. 5, cedar timber back of Coal Harbor. The dimension of this timber can be realized by comparing with the size of the man standing alongside. Fig. 6, same as Fig. 3.

CEDAR TREES BACK OF COAL HARBOR, QUATSINO SOUND.

A Wonderful Calendar.

There is nothing more wonderful in the chronological and time-keeping line than the "Theosophical Calendar According to the Secret Doctrine." From the theosophical point of view the four ages are as follows: Sata Yuga (golden age), 1,718,000 years; Tresta Uga (silver age), 1,296,000 years; Dwapara (copper age), 864,000 years; Kali Yuga (iron age), 432,000 years. The total of these four ages makes one Maha Yuga, or great age, of 4,320,000 years. One thousand Maha Yugas make one Kalpa, or Day of Brahma, equal to 1000 times 4,320,000 years. After the expiration of that unthinkable period of time the Night of Brahma (equal in duration to the length of the day) comes on, and the earth vanishes from the plane of existence. Three hundred and sixty days and nights of Brahma make one year Brahma, and 100 years of Brahma make the Great Kalpa, a period of 311,040,000,000,000 years, after which the sun and the entire solar system plunge into impenetrable night, and everything on the "objective plane" is destroyed. Then comes the period known as the Great Night, and which is equal in length to the Great Kalpa. After the Great Night has lifted its sable mantle a new solar system is formed and evolution begins anew.

12-FOOT COAL SEAM, THREE MILES WEST OF COAL HARBOR.

According to the doctrine of the theosophists, we are now living in the Kali Yuga, the last of the four ages, and it began nearly 5000 years ago, with the death of Krishna, who died 3102 years before our era began. The first minor cycle of Kali Yuga will end in the years 1897-98, but will still have something like 427,000 years before we arrive at the end of the present age.

Kali Yuga is also known to the theosophists as the Black Age. It is an age of spiritual darkness in which the human race prays for the misdeeds which are recorded against it in the previous ages.

THE second annual general report upon the mining industry of the United Kingdom and Ireland was issued by the Home Office on Friday December 4th. The total number of persons employed at all the mines and quarries in 1895 was 838,282, of whom 733,657 were employed in or about mines, and 104,625 in or about quarries. Of the 733,657 persons employed at mines 584,298 worked below ground, and 149,359 above ground, of whom 5636 were females. The total value of all the minerals produced was £69,129,667 or £8,769,274 less than the corresponding figure for 1894. This great diminution in the total value is partly accounted for by a decrease of five and a half millions in the value of the coal, and a decrease of more than £300,000 in the value of the iron ore, although, in both cases, the quantity raised was greater. In fact, compared with 1894, there is an increase of 1,383,837 tons of coal, or .73 per cent., and an increase of 248,106 tons of iron ore, or 2 per cent.

MEN AND WOMEN have each their sphere in society. Woman may be fitted to fill man's place, but man can not fill woman's. So if woman enters man's sphere there must remain in society a place unfilled, a work undone.

THE Pacific Coast Oil Company, of which Charles N. Felton is president, has leased the Schubert ranch near Half Moon Bay and the Bell ranch at San Gregorio for ten years with the object of sinking oil wells.

The Skiff Mining Expert of the Lower Colorado River.

Written for the MINING AND SCIENTIFIC PRESS.

"Their cause I plead,—plead it in heart and mind;
A fellow feeling makes one wondrous kind."

Premising the gentlemen who, during the delightful winter season peculiar to this desert region, meander adown the Rio Colorado of the West by skiff, the initial point The Needles and the journey terminating at Yuma, have a knowledge, practical or otherwise, of mines, the writer, for their better understanding as a minor factor, and that the investigating public who employ them to expert the territory bordering the Colorado river more particularly, would mildly suggest that mineral deposits do not occur hereabouts radically different from those that are found in less uncongenial physical surroundings. A similarity of diverse geological conditions prevail, as they do in sections more kindly favored by nature. The mineralized lodes exist in the granites, porphyries, slates, etc., as veins of true fissure, contact, segregation, blanket, gash, and their modifications, and in the mountain ranges generally bordering the Colorado river, as a rule somewhat away from the river's brink, in fact, often some miles distant. Now, this is certainly unfortunate—not to say criminal—in that it conduces to the discomfort of some of these gentlemanly experts and renders inoperative their efforts to "Help the blasted country out, don't you know."

There is reason in all things, but who would expect a gentleman to tramp it, or, perchance, to ride an undignified burro anywhere from 5 to 25 miles in such a beastly, inartistic country! Certainly it would have been nicer had these several remote (?) mining districts moved their lode veins to the river's brink, stood them on end, and labeled their several virtues (they seldom have faults), for the edification of these meandering critics.

When the Roentgen rays shall have attained perfection, doubtless, one may mine expert the desert region bordering the Colorado of the West while floating down its yellow waters.

There are many conscientious mining men, who, having "reported" certain properties on the Colorado river, have advices to continue on by skiff and look into any other "prospect" they may hear of.

Receiving no accurate information whereby he may to a certainty find some of the many mining prospects that are being exploited in a small way by the original locators, and with nothing to mark the steamer's landings save, probably, a small flag, this vast virgin field is but touched. To this class of "mining men" this letter has no application, as they *never* condemn wholesale an unknown territory. But the gentleman who, "girding up his loins," with advice and condolence from admiring friends and employers, more or less firmly seats himself in the stern sheets of a staunch skiff, with an old riverman and expert camper for motive power, braves the perils of the turbid Colorado—likewise the canned and bottled goods, with bedding galore—launches forth as a modern Columbus, in the interests of —— and shekels, having returned to the fleshpots of Egypt, he invariably, and with a jauntiness that would be amusing were it not harmful, either "damns with faint praise," or literally damns and condemns a region of which he personally has absolutely no knowledge whatever.

The writer knows of several meritorious mining "prospects" bordering the Colorado river where the owners have been and are slowly doing legitimate exploratory work; they are earnest, industrious men, and, having faith in their claims, prove it by putting in their time and money as best they may, working under disadvantages residents of more congenial climatic surroundings have no conception of. These men generally do not wish to sell out entire, but would like development money for interests in their holdings. When working to that end—as an instance—the miner was met by the assertion: "Why, I have been told that there are no good mines along the Colorado." When cited to the Gold Rock, with its 150 stamps dropping on pay rock; the La Fortuna, turning out $80,000 in gold each month with 20 stamps; the Senator, to be heard from, holding 12 feet of rich pay rock at the 200 level, and, from all evidence, a rival to the La Fortuna in the early future; the developments in the old Picacho district, on wholly new ground, with mills now in and those on road approximating 130 head of stamps—as some of the *going* mines on the Colorado river, near to Yuma, the reply was: "Yes; but the region *you* are in is a new territory; I have not heard of it." The wholesale condemnation of a vast, practically unknown territory by the gentleman *in* the skiff may have choked off this deal, for we know how ill news travels, however slight and trivial the foundation.

I sometimes wonder if it occurs to some people that there is an inception process in a mine—a *beginning*—just as there is in every other condition, from the founding of a world to the infant puling in its mother's arms, who may in the course of events deliver harmful mouthings to cover up his personal shortcomings.

TAYLOR D. MACLEOD.

Yuma, A. T., January 18, 1897.

The Copper Mines of Nevada.

Written for the MINING AND SCIENTIFIC PRESS.

Nevada is wonderfully rich in copper, yet is not known in any market as a copper-producing State. In the scramble for mines of the more precious metals not much attention has ever been given to the copper-bearing veins of the country. Indeed, for fifteen to twenty years, while the silver harvest was in profitable progress in all the leading camps, miners and prospectors cared for nothing but silver lodes; even gold-bearing lodes of good promise were given the second place, if taken hold of at all. Thus it happened that no one ever thought of Nevada as a gold-producing State until recently, when men turned their attention to searching for the yellow metal. It has been much the same as regards copper. Nevada is not thought of as a copper region, yet the State is full of copper lodes, many of which, properly developed, would prove very profitable and desirable properties because of a large per cent of the values they contain being in the precious metals. In places in Nevada copper is not only found in veins, but also in mountain masses.

Now that there is a greatly increased consumption of copper with a promise of a continuance of the present prices, if not of an advance in them, it would seem that the copper mines of Nevada should be worthy of the attention of capitalists. The development and working of the copper deposits would as much contribute to the prosperity of the State as would the opening up and working of the same number of mines of gold and silver. All the benefit derived by Nevada from the working of any of her mines comes to her in the shape of money paid to miners and other workmen as wages. However rich a gold or silver mine may be, the State is only benefited to the extent of the amount of money paid out as wages. The precious metals extracted and all the profits obtained go to the cities of the East and to Europe.

Some sporadic attempts at working the copper deposits of Nevada have been made from time to time, and with good results, the inefficiency of the apparatus and the methods employed being considered, but other enterprises constantly offered that proved more attractive, and when the price of copper went down the mines were shut down and the locations made on copper deposits by prospectors were nearly all abandoned. From 1875 to about 1882-3 the price of copper in New York ranged from 18 to as high as 25 cents a pound, when prospectors and mining men began to locate and open copper properties, but when copper went down to less than half the rates mentioned most of the locations were abandoned, their owners returning to the more profitable occupation of mining the precious metals.

However, considerable holding and development work had been done in different sections on copper deposits, and in a few places small furnaces were erected for smelting the ores. Some of the copper mines paid a fair profit, while copper commanded a high price, though the furnaces were poorly constructed and were mostly managed by persons of little experience in copper smelting. Some copper smelting was done as late as 1888 and 1890, also some small shipments of ore were still occasionally made to the East and England, particularly ores containing the precious metals.

Although copper veins are found in all parts of the State, from the Colorado river to the south line of Oregon, still there are in places regular belts of copper deposits, just as there are silver belts and gold belts. In some sections these belts are more or less mixed, when a lode running high in copper will be found to carry in addition paying amounts of gold and silver. Occasionally there are very large copper belts, as at Walker's lake and at places in Humboldt and Elko counties. By the early prospectors these were known as "copper regions" and generally shunned.

Most of the copper ore mined in Nevada in times past was sold to the acid works at Dayton, Lyon county, where it was used in the manufacture of bluestone (sulphate of copper). The Jackson mine, at Walker river, furnished much ore to the acid works. It is a mountain mass of copper ore. In working it neither machinery nor timbers were used. Pillars of copper ore from 10 to 15 feet in diameter were left as supports to the roof. The ore yielded from 25 to 80 per cent copper and from $5 to $15 a ton in silver. The Ludwig mine, near the Jackson, is equally rich. The owners of the Ludwig sold to the acid works ore to the value of $200,000 or $300,000. The ore was principally quarried from an open cut.

The Wheeler mine, west of Mason valley, sold ore to the acid works for a time. The ore runs about 25 per cent in copper. In this Walker river region are many copper mines on which no work was ever done. In all these mines are streaks of nickel and cobalt. In 1882 the Esmeralda Smelting Company, at Soda Springs, on the Carson and Colorado railroad, produced 350,000 pounds of copper. The ore was obtained from a mountain of copper near the works. When copper fell in price the smelter was shut down and nothing has since been done at copper smelting in any part of the State.

There are many good copper mines in White Pine county. In 1880 a mine in Robinson district produced 357 tons of ore that yielded 134,730 pounds of copper ingots. At Bald Mountain are also rich copper veins, the ore of some of which go as high as 60 per cent.

In Lander county, near Battle Mountain, is a small copper belt, four miles long and two miles wide, on the veins in which some work was done in early times. These mines all yielded more or less gold and silver. The Trenton went 15 per cent copper and carried $150 a ton in silver; the Bluebird, 28 per cent copper, $9 in gold and $21 in silver per ton; the Washington, 28 per cent copper and $50 to $60 in gold and silver; the Columbia, 50 to 75 per cent copper and $5 a ton gold; the Battle Mountain Company (four mines), one, 30 per cent copper and $9 a ton silver. They shipped to Liverpool extensively in 1870. The Josephine was rich in copper and paid $130 a ton in silver. The veins are from 4 to 6 feet wide and all carry gold and silver in addition to a good per cent of copper.

In Humboldt county are many copper deposits. Work was done on some of these in the early days. At one time the Lake Superior Company shipped from their mine, near Galena, 100 tons of ore a month. The ore went from 15 to 75 per cent copper and carried some silver and gold. It was sent to Liverpool at a cost of $35 a ton. The Virgin and other mines in the belt are of the same character, and all carry gold and silver. In Winnemucca district there are copper mines that carry from $15 to $25 a ton in gold and silver in all their ores. In Columbia district, Puebla mountains, Quin river, is a big copper belt, the ores of which carry gold and silver in addition to 40 per cent of copper. In this district is found much native copper. In Portis district, near the Little Salmon river, is a fine copper belt. The ores carry $9 in gold and 15 ounces of silver a ton and run about 40 per cent in copper. On the Little Salmon, some Montana men last summer put up a small prospecting smelter. It made such a good showing that other Montana parties will erect a large plant in the district.

The Adelaide copper mine is in Gold Run district, Humboldt county, twelve miles south of Golconda. Some smelting was done about 1889; but, for some reason, operations were discontinued. In the mine is a width of over 100 feet of solid ore. The ore carries both gold and silver. This mine is now being prospected by an English syndicate with a force of eighty miners. In the opinion of some experts, the mine will prove to be a second Anaconda.

There are many copper mines in Elko county, in Granite Mountain district, Sooner district, Kit Carson, and on the Salmon river. The veins carry from $40 to $60 in silver in addition to a paying per cent of copper. Nye county contains some large copper belts. In the southwestern part of the county is a remarkable belt of veins of copper and iron. In Volcano district are no fewer than thirty distinct copper lodes, all of great size, and all carrying gold and silver. Here are also found deposits of petrified trees of large size. It is a very peculiar and interesting region. On the slopes of some of the mountains are strewn great quantities of geodes of all sizes. When these are broken open they are found to contain beautiful crystals of a variety of colors. These geodes are not only strewn on the surface, but also in the ground beneath; they may be dug out like potatoes. About Palmetto, Esmeralda county, are many good copper mines, some of which carry over $50 a ton in gold and silver. In the placers at Tule canyon, in the same county, the gold is alloyed with copper.

At Peavine, Washoe county, are copper lodes that carry both gold and silver, and veins of the same character are found at Pyramid lake. In fact, copper is to be found in every county in the State, but, of course, not everywhere in paying quantities.

There are doubtless a sufficient number of copper lodes in the State, that would pay well if opened up and properly worked, to give employment to thousands of miners. It is to be hoped that such a success will be made by the parties now opening the Adelaide that capitalists will flock in and take hold of other properties of the kind. Since the days when the people of Nevada were experimenting with furnaces of various kinds and all manner of fluxes copper smelting has been reduced to a science in many places; therefore, were men of capital to bring to the State and put in operation up-to-date plants they would make a good thing out of our ores, as in most cases the gold and silver contained in them would add very materially to the value of the product.

Copper properties are now in brisk demand and the demand is likely to grow into a boom in the near future. The consumption of copper is increasing at a remarkably rapid rate in Europe, and the indications are that the demand for the metal will steadily grow, as there are now new uses for it in several directions, and particularly in the manufacture of electrical apparatus. The time is at hand when copper mines will no longer "go begging."

DAN DE QUILLE.

Virginia City, Nev., Jan. 17, '97.

Nevada City, Cal., District Geology.

NUMBER VII—CONCLUDED.

With the exception of the North Star group, nearly all in the veins in the larger, southern part of the district have a general north-and-south direction and a medium to flat dip either east or west. They are usually rather narrow, and carry a high-grade ore, with occasional bunches of coarse, free gold. The sulphurets, which consist chiefly of iron pyrites and some galena, are not abundant, and are usually only of medium grade. In places a strong sheeting of country rock parallel to the vein may be noted, as, for instance, in the granodiorite of the western part of Mill street, Grass Valley, or in the diabase in the vicinity of the Larimer mine on Wolf creek. Intersecting the vein is a system of "crossings," or barren seams, with a steep dip and general northeasterly trend. These crossings sometimes fault the veins slightly and usually carry a great deal of water.

The Rocky Bar vein extends for 3500 feet on the west side of Wolf creek and lies in diabase, the dip being flat to the east. It has been worked only to a depth of a few hundred feet, but is known to have produced several million dollars. During late years it has not been worked to any great extent. The vein is very irregular in its tenor, sometimes being extremely rich in coarse gold, sometimes not paying milling expenses. On the east side of Wolf creek lies the Dromedary vein, in granodiorite and with a westerly dip. It has not been worked to the extent of the former vein but is known to have produced some rich ore. At Granite Hill mine the vein is about one foot thick and carries coarse gold in rich but irregular shoots. The vein cuts the diabase contact without change.

In the continuation of this vein southward lies the Omaha vein system, all veins dipping west. The Omaha vein, which has long been an important producer, lies, like all others of this system, in very hard granodiorite, and has been opened up through the Omaha and Lone Jack shafts to a depth of 1500 feet on the incline. The ore is high-grade, with 2½ per cent of rich sulphurets, principally iron pyrites, with a little galena, zinc-blende, and copper pyrites, the vein averaging one foot in thickness. South of the Omaha and on the same vein are the Hartley and Homeward Bound, which have been opened up to a less extent. The Wisconsin is a parallel vein to the west. The system is continued southward by many veins, the most prominent of which is the Allison Ranch. It was worked between 1855 and 1866, but was opened only to a depth of 500 feet. It produced in that time $2,300,000. The vein is about 1½ feet wide and shows no extensive croppings on the surface.

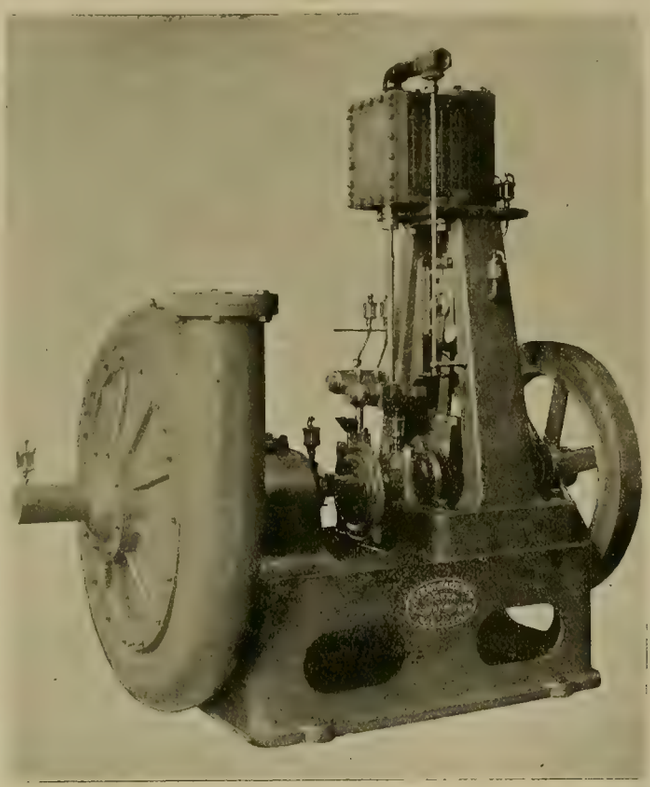
The great Osborne Hill vein system contains a large number of parallel and linked veins, nearly all with a moderate westerly dip. The W. Y. O. D. vein has been an important producer during the last few years. It is partly in granodiorite, party in diabase, and has been sunk upon to a depth of 1100 feet on the incline. The Pennsylvania mine lies to the west of the W. Y. O. D., in granodiorite. It is a narrow vein, averaging 1 foot, and has been worked to a depth of about 500 feet on the incline. The celebrated Empire mine contains two veins, Rich Hill and Ophir Hill, the principal work having been done on the latter, on which a shaft has been sunk to a depth of 2400 feet on the incline. The vein is from 1 to 1½ feet thick and frequently contains coarse gold. The sulphurets amount to 2½ per cent. The ore is high-grade and for many years averaged $25 per ton.

The veins in the continuation of the Ophir Hill were worked to a depth of a few hundred feet prior to 1870. From then till recent years but little was done. The developments in this vicinity during the last few years, however, are, on the whole, encouraging. The Osborne Hill mine has lately been opened to a depth of 500 feet on the incline, exposing good bodies of high-grade ore. The Osborne Hill vein is from a few inches up to 2½ feet wide, and is characterized by a large amount of arsenical pyrites in the sulphurets, as are also several adjoining veins. Good ore shoots have also been found recently in the Electric and Centennial mines. To the south of the Osborne Hill mine there are several strong and well-defined veins, as shown on the map, but the developments on them are not extensive. The country rock in all these mines is diabase-porphyrite or porphyrite-breccia.

Along the granodiorite contact west of Osborne Hill and about in the continuation of the W. Y. O. D. vein, there are several veins, mostly in granodiorite and dipping east or west. The principal are the Bullion, Alaska and Ben Franklin, from all of which good ore has been extracted, but they have not been worked extensively for many years.

The North Star group of veins has a westerly or northwesterly strike and a flat northerly or southerly dip. The North Star vein, which dips to the north, has long been one of the principal producers of Grass Valley, and is opened by a shaft 2400 feet deep on the incline. The vein is narrow, averaging 1 foot and sometimes closing down entirely. The ore

is of high grade, running from $15 to $50 per ton, and carries 4 per cent of sulphurets (pyrites and galena) with an average value of $53 per ton. The country rock is a porphyritic diabase. The production for 1893 was about $356,000; considerably less, however, was produced in 1894. Roughly parallel to the North Star vein is the New York Hill vein, opened to a depth of 500 or 600 feet by the New York Hill and Chevanne shafts. This vein, also in diabase-porphyrite, averages 15 inches in width. The ore averages $40 per ton, carrying coarse gold and 2 per cent sulphurets of a tenor of $80 per ton. The vein has not been worked during recent years.



The workings on the New Rocky Bar mine have exposed an interesting, flat vein belonging to the same system, not cropping at all, but forming a flat arch, or "hog's back," as shown in the structure-section sheet.

Outside the limits of the area of the map, but usually considered as belonging to the Grass Valley district, are the veins of Forest Springs. They are located near Wolf creek, four miles south of Grass Valley, the two principal ones being Norambagua and the Slate Ledge. The former is in granodiorite and dips 15° east. The vein averages 9 inches, carrying ore going about $50 per ton, and containing 1½ per cent of sulphurets, chiefly arsenical, worth about $50 per ton. The shaft is 500 feet on the incline and has not been worked much since 1868. It is said to have produced $1,000,000. The Slate Ledge, close by, is in slate and porphyrite, with strike east and west, dip 30° south, and an average width of one foot. The ore contains much arsenical pyrite and is in part very rich.

About four miles west-southwest of Grass Valley, on Deadman's Flat, there are several veins with dips ranging from 30° to 70° west. None of them are opened below 300 feet. The country rock is diorite and amphibolite. The California (Pittsburg Consolidated) shows a narrow vein of high-grade ore with 5 per cent sulphurets. The Seven-Thirty is a little farther south and shows a wider vein of good ore, while the Normandie, to the east of the veins before mentioned, contains two 6-inch veins of high-grade ore.

Pump and Engine.

The pump and engine herewith illustrated was especially designed for the United States Navy Yard dry dock at Mare Island, and is known as Jackson's Whirlpool Centrifugal Pump No. 8, with eight-inch suction and discharge pipe. It is directly connected to the plain slide-valve steam engine cylinder, 9x9 inches; revolutions, 250 to 300 per minute; maximum lift, 30 feet; minimum lift, 10 feet. It is designed to occupy small space, to be convenient to take apart and get inside of the pump without removing any of the working parts. Lubricating cups are arranged for oiling while engine is running, permitting the engine to run an indefinite time without stopping. The makers have recently completed a duplicate compound engine and pump for the Edison Light and Power Company of this city, which pumps all the water for condensing from San Francisco bay to the three power stations, A, B and C, aggregating about 10,000 H. P. The engine and pump are guaranteed to run thirty days and nights, continuously, without showing any signs of distress; the pump to give 600 per cent efficiency, and the engine to consume not more than fourteen pounds of water per indicated horse-power per hour.

WHIRLPOOL CENTRIFUGAL PUMP.

Gold Product '94, '95, '96.

The gold production of the United States for 1896, by States and Territories, according to figures of Director of the Mint Preston, compares with 1895 and 1894 as follows:

	1896.	*1895.*	*1894.*
Alaska	$3,249,000	$2,796,000	$1,113,550
Arizona	2,418,000	1,333,000	1,784,435
California	16,500,000	14,880,000	13,570,397
Colorado	13,000,000	13,120,000	9,491,514
Idaho	2,474,000	1,779,000	2,081,281
Montana	4,440,000	3,888,000	3,651,410
Nevada	2,955,000	1,552,000	1,137,819
New Mexico	525,000	480,000	567,751
Oregon	1,300,000	890,000	1,422,054
South Dakota	4,650,000	3,870,000	3,290,100
Utah	1,920,000	1,370,000	868,031
Washington	382,000	352,000	195,100
Appalachian	306,000	.....	273,072
Totals	$54,119,000	$46,610,000	$39,500,000

Mr. Preston believes 1896 world's gold production will be $215,000,000, an increase of $12,000,000 over 1895. The world's gold production has more than doubled during the last ten years, as production in 1886 was but $106,163,000.

A Modern Surveying Instrument.

Written for the MINING AND SCIENTIFIC PRESS.

For general mining purposes it is essential that the transit should have the following features:

The tripod must by all means be adjustable and light—in fact, the entire instrument should be made with a view to lightness as well as rigidity.

The telescope should be reversible on its horizontal axis.

There should be a complete vertical circle. Do not be content with only an arc. A complete circle is necessary to *properly* run a straight line, because one should reverse the telescope and backsight as well as to revolve the alidade about the vertical axis and backsight. By this method, if properly executed, all instrumental errors are eliminated and observation errors checked.

Stadia wires should be inserted in the telescope for doing topographical work and for measuring distances where chaining is difficult, as over bluffs, across canyons and along steep (sidling) places. But the stadia wires should be adjusted to read from the center of the instrument instead of from the apex of the visual angle. This is practically correct for all distances over 100 feet and is as near right as the average surveyor will chain. If the wires are thus adjusted it is evident that computations involving "c" and "f" are obviated. Some prefer the disappearing stadia wires, i. e., stadia wires that are out of focus when the vertical and horizontal wires are seen and vice versa. It may be as well to add for the benefit of those who do not have much faith in stadia measurements, that measurements quite as accurate as can ordinarily be made with a chain can be made by the following method: Use a rod with two targets, one secure at the top of the rod and one movable lower down. Bring the upper stadia wire upon the top target and place the lower one by the lower wire. The rodman reads the distance from the vernier of the lower target. In ordinary work, however, the transitman reads the distances from an ordinary stadia board.

The next statement will likely be disputed by old surveyors, viz., that the graduations on the horizontal limb should read from 0° to 360° and in direction S. W. N. E. instead of from 0° to 180° each way. This will obviate errors in reading the verniers and give the bearing of the line without the use of letters. Once used, the old way will never be reverted to. Both styles of graduations may be placed on the limb, however, but is *never* necessary and often leads to error by reading the vernier the wrong way. In traverse surveying, on the surface or underground, this style of graduation is especially advantageous, the azimuth being always reckoned from 0° to 360° and read to the minute or to 30 sec., as the case may be, instead of the old way of reading the compass needle to the nearest 15 minutes. Then, instead of using the now almost obsolete traverse table, use tables of logarithmic sines and cosines arranged for the purpose. The work will be infinitely more accurate, especially if long shots be taken.

The level on the telescope should be long and well made, so that the transit may be used instead of a level in many cases.

There should be four leveling screws and a shifting center. Tangent screws are necessary for the vertical circle and horizontal limb.

If a solar attachment is desired, the "Sægmuller" attachment should be purchased, as it can be used with a complete vertical circle, has a telescope sight and in every way answers the purposes of a solar compass. A moderate-priced instrument, kept in fine adjustment, will do better work than a high-priced one that has been abused.

Junction, Nevada. O. H. PACKER, M. E.

The Loss to the Farmer Through Debris.

While estimating the losses to the miner from closing the hydraulic mines it is but fair to estimate the loss to the farmer from the debris. The losses have been in three directions.

First—The direct damage to property by debris.

Second—The loss of the product from this property.

Third—The loss to the industries contingent upon this property.

First—*The direct damage to the property by the debris.* The State Engineer* determined that 43,546 acres had suffered depreciation to the amount of $2,597,-634. The United States Engineers† estimate that 53,149 acres have suffered depreciation to the amount of $3,304,035.

Aside from this damage to agricultural lands there has been some damage to the towns of Sacramento and Marysville and damage to navigation. No estimates have been made as to the damage to Sacramento but it has probably been very light.

The following record of assessed value of property at Marysville has been published:

Year.	*Assessed Value.*
1855	$3,354,091
1860	3,823,518
1865	2,350,679
1870	1,844,340
1875	2,106,825
1880	1,703,900‡

Supposing the assessed value to be 50 per cent of the real value the decrease has been about $2,500,-000. Marysville was at one time the gateway to the Yuba mines but the railroad to Grass Valley robbed her of her prestige so that property values would probably have decreased had never a pound of debris filled the river.

Second—*The loss of product from ruined lands.* The lands covered by debris have not been entirely ruined nor their product entirely ceased. Estimating the annual product from such lands not covered by debris at $40 per acre, and that the damage began in 1865 and gradually increased until 1880, the total possible product from lands destroyed up to 1896 could not exceed $35,000,000.

Third—*Loss to sympathetic industries.* The capital contingent to handling a product of $1,750,000 annually of farm produce would not exceed twice the amount of production, or $3,500,000. Supposing this capital to be entirely lost, although the industries contingent to agricultural products are probably less dependent upon any one locality or industry than those dependent upon mining, we therefore have a total loss of about $45,000,000 in round numbers.

In addition to these losses, there has been the extra expense imposed upon residents of the Sacramento valley from the extra diking due to debris and the extra cost of reclaiming lands. But some lands have been benefited by the slickens and others benefited by the higher moisture level due to a higher river and flood surface. A question often considered is: What is the maximum amount of damage possible from the mines? State Engineer Hall estimated the area of the Sacramento valley as follows:

	Square Miles.
High hill lands (Marysville Buttes)	55.50
Low hill or rolling lands	650.00
Dry plains above overflow	2,331.45
Dry plains subject to occasional overflow	450.00
Swamp lands subject to overflow, lands covered by debris, etc	1,254.00
River and slough surface	38.05
Total	4,769.00 §

The lands subject to occasional overflow cannot but be benefited by a higher river level and a consequent higher level of moisture. The lands are so far back from the river as to receive no sands, and the clayey slickens do more good than harm. The area subject to yearly overflow is, therefore, the area through which damage will result. This area is estimated at 1254 square miles, or 802,560 acres; if valued at $40 per acre, would amount to $40,128,000.

Supposing the annual washings from the hydraulic mines were to continue at the rate of 1880, and that 10% of excavated material found lodgment in this flood plain, it would require over 300 years to cover this plain one foot deep.

It will be seen from the table of estimated debris resting in California drainage channels that but 8% of the total debris lies in the Sacramento and in the Feather river below Marysville. But it was shown that but one-fourth of this debris comes from the mines; in other words, one-fiftieth of the debris excavated from the mines finds lodgment in this channel. At the rate of annual washing in 1880, the channel would be raised one foot in 38 years.

The Solution and Precipitation of the Cyanide of Gold.*

NUMBER VI.

By S. B. CHRISTY, Professor of Mining and Metallurgy, University of California, Berkeley, Cal.

7. *The Precipitation of Gold from Cyanide Solutions by Means of Metallic Zinc.*

The precipitation of gold from cyanide solutions by means of zinc-shavings has been more generally used on the large scale than any other. It appears on the face of it the simplest method that could be devised, and in proper hands and under intelligent supervision it has given, on the whole, better results than any other method in general use. Nevertheless, those who have used it most are the most anxious to find some other method.

Some of the principal objections urged against it are the following:

1. The great consumption of zinc compared with the amount of gold precipitated.
2. The great destruction of potassium cyanide to no useful purpose.
3. The great difficulty of removing zinc and cyanogen residues from the gold, thus causing loss in melting and the production of an unclean bullion.
4. The failure, in certain cases, to precipitate the gold.

I do not need to dwell on the first three of these difficulties. They have been sufficiently emphasized by every one who has described the practical application of the cyanide process; but the incomplete precipitation of the gold has not been sufficiently recognized.

One reason for this appears to be that the reaction which takes place when gold is precipitated from the potassium-aurocyanide is not as simple as it is generally supposed to be. Thus Dr. Scheidell, in the *Bulletin* of the California State Mining Bureau, on the "Cyanide Process," 1894, p. 34, states the usually accepted view. He says:

"The action of zinc on gold solution is theoretically very simple, a simple substitution of the gold by the zinc according to the equation:

$$2AuKCy_2+Zn=K_2ZnCy_4+2Au."$$

This reaction had also been given in almost the same words by Butters and Clennell (*Eng. and Min. Journal*, Oct. 29, 1892). Wilson ("Cyanide Process," p. 34) and Rose ("Metallurgy of Gold," p. 323) adopt the same reaction.

My attention was first called to this subject by a remark of Mr. W. R. Feldtmann (*Eng. and Min. Journal*, August 11, 1894), who, speaking of the precipitation of gold by zinc, says:

"Its completeness appears to depend, in a measure, on a slight excess of cyanide of potassium being present in the solution."

The same fact was recognized by one of my students, Mr. B. E. James, when acting as assayer at the Mercur mine, Utah (MINING AND SCIENTIFIC PRESS, May 23, 1896).

This led me to investigate the reaction which occurs. I had prepared a solution of potassium aurocyanide with about 1.3 per cent metallic gold and no free cyanide. A solution made from this by dilution, so as to contain 0.1 per cent, or $603 per ton, gold, was then treated with strips of sheet zinc for twenty-four hours. The strips were carefully burnished with emery paper, or with a sharp knife, to avoid any film being left on the surface of the zinc. Commercial sheet zinc was used, as is done in practice. The solution was contained in glass tubes, sometimes at rest, sometimes rotated mechanically for the whole period of twenty-four hours.

In no case was more than a trace of gold precipitated. In many cases, where the zinc was brightly burnished, not a trace of gold came down, and the strips weighed exactly the same to a hundredth of a milligramme before and after the test, and when dissolved in sulphuric acid left no trace of gold.

These experiments throw light on the statements often made that it has been possible to extract the gold from the ore but not from the solution. A person trusting to the above-described reaction might easily throw away such a solution after twenty-four hours' contact with bright metallic zinc, even though it contained $603 per ton.

The next experiments were made with lathe turnings from the same sheet zinc which, in the polished state, had failed to precipitate gold. With potassium aurocyanide containing 0.1 per cent, or $603 gold, per ton, which had failed to precipitate at all on the bright sheet zinc, the gold was entirely precipitated from the solution in twenty-four hours by filtering it through a very large excess of zinc shavings (over four hundred times the weight of the gold present). The filtrations were repeated through the same shavings four times.

When the solution contained only $10 worth of gold per ton, the precipitation was only 82 per cent of the gold in solution in a single filtration which lasted twenty-four hours. In each case the solution was allowed to remain in contact with zinc shavings, four hundred times the weight of the gold in solution, until a color of gold appeared on the shavings; then the solution was allowed to flow from the filter drop by drop, the shavings being continuously submerged. The conditions were, therefore, much more favorable for complete precipitation than could be maintained in practice.

These differing results are very difficult to explain on the simple substitution reaction usually accepted. If the gold precipitates on the shavings, why should it not do so on the same sheet of burnished zinc from which the shavings were made? There is a larger surface of contact, it may be suggested. But even the smallest fragment of a zinc shaving will precipitate gold on itself, while, in the same solution the freshly scraped surface of sheet zinc, many times its area, is entirely or practically without action. It may be thought that the turnings had a cleaner surface than the scraped zinc, but this cause was carefully eliminated.

All the indications point to the phenomena of "polarization," so well known in electrolytic work, where the formation of invisible traces of films on the surface puts a stop to further action, either by preventing contact, or by setting up an opposite electromotive force.

I have not had time to establish firmly the following explanation of the phenomena which I have observed, but there seems some evidence in its favor.

There is no doubt that, besides the tendency of the potassium-aurocyanide to split up into KCy and Au and Cy, which is assumed in the reaction by substitution, there is also a tendency for it to split along another line, viz., into K and $AuCy_2$, the latter playing the part of an acid-radical. Now, if this takes place in the presence of zinc and water, the water will be attacked by the potassium, forming caustic potash and hydrogen, and the $AuCy_2$ will be attacked by the zinc, forming zinc-cyanide and metallic gold, according to the following reaction:

$$2KAuCy_2+2Zn+2H_2O=2ZnCy_2+2KHO+2H=2Au.$$

There is no doubt that a certain tendency to form this reaction exists, for electrolysis proves it. It can only take place here by setting up a condition of polarization on the surface of the zinc, owing to the film of occluded hydrogen set free on its surface. If this be so, it is now very clear why the zinc turnings act, while the smooth zinc does not. The turnings have an infinite number of ragged edges, which favor the escape of the hydrogen gas, and the relief of the condition of polarization, and thus allow the reaction to proceed. The hard, smooth surface of the rolled sheet zinc is very unfavorable to the formation of gas bubbles from its surface, and hence to the continuation of the reaction.

Of course, when the reaction once sets in as above, there is a further reaction between the caustic potash and the zinc cyanide, by which a part of the latter is dissolved, and potassium zinc cyanide and potassium zincate formed. Thus:

$$2ZnCy_2+4KHO=ZnCy_2,2KCy+ZnK_2O_2+2H_2O,$$

as already pointed out by Mr. J. S. C. Wells in a valuable paper (*Eng. and Min. Journal*, December 21, 1895). The complete reaction would then be:

$$4KAuCy_2+4Zn+2H_2O=2ZnCy_2+ZnCy_2,2KCy+ZnK_2O_2+4H+4Au.$$

The turning point would seem to be: Is hydrogen formed as these reactions require, or is it absent, as called for by the substitution reaction? Numerous experiments have always shown that by the action of a solution of potassium aurocyanide containing only 50 mgs. of gold and zinc turnings, hydrogen gas is set free in sufficient quantity to give a well defined flame (4 or 5 c.c.). The hydrogen does not form in noticeable quantity at first; but, as the gold begins to come down, on shaking the zinc turnings, fine bubbles of gas escape, and may be easily collected in quantity. It may be objected that the replacement reaction took place, and that the hydrogen was evolved by the subsequent reaction of the $2KCy,ZnCy_2$ on the zinc. Experiment shows that the double cyanide of zinc and potassium acts very slightly on zinc shavings, but that when the latter have been partly plated with gold, hydrogen is then set free. So that the presence of hydrogen at the end of the reaction may be due to this cause, at least in part. It is also probable that the nascent hydrogen is, in part, absorbed by the solution with the formation of methylamine:

$$HCN+2H_2=CH_3NH_2,$$

the HCN being formed by the partial dissociation of the dilute cyanide solution by "hydrolysis."

$$KCN+H_2O=KHO+HCN.$$

Another curious fact remains to be recorded. When zinc turnings are placed in distilled water containing a drop of phenolpthalein no coloration takes place. When phenolpthalein is added to pure potassium aurocyanide, no coloration takes place. This shows the aurocyanide to be but little dissociated. When the latter solution is poured upon the former, at first no change occurs; but, as the gold begins to separate upon the zinc, a deep purple stain surrounds the zinc turnings where the gold has separated out, showing that the reaction has become alkaline. Whether this is due to the formation of caustic potash, methylamine, or the double cyanide of zinc and potassium, I have not demonstrated with certainty. The fact, however, that zinc cyanide seems to separate out early in the reaction, indicates the reaction I have suggested.

Yet another point remains to be mentioned. When to a solution of potassium-aurocyanide which has been left for twenty-four hours in contact with zinc strips, without action, a little free cyanide of potassium is added, the gold comes down at once and the precipitation is soon complete. This fact seems an additional confirmation of the reaction that I have suggested. It will be remembered that the formation of the insoluble cyanide of zinc is a feature of this reaction. If this occurs it is certain that a film of this substance, perhaps infinitely thin, must cover the surface of the zinc, and, in addition to the film of hydrogen, prevents the contact necessary to continue the reaction. The presence of free cyanide of potassium, of course, readily dissolves this film, and the reaction is free to continue.

The reaction which actually takes place in precipitating gold from solutions containing free cyanide of potassium will then be something like this:

$$2KAuCy_2+3Zn+4KCy+2H_2O=2Au+2(ZnCy_2 2KCy)+ZnK_2O_2+4H.$$

It will be remembered that according to the substitution reaction one atom of zinc replaces two atoms of gold, or 1 ounce of zinc should precipitate 6.2 ounces of gold; whereas, as every one knows in practice, 1 ounce of zinc will precipitate only from $\frac{1}{5}$ to $\frac{1}{15}$ of an ounce of gold, or thirty to ninety times less than the amount called for by the reaction by substitution. According to the reactions I have suggested, in the absence of free cyanide of potassium and caustic potash 1 ounce of zinc should precipitate 3.1 ounces of gold. In the presence of a moderate excess of cyanide of potassium it should precipitate 2.06 ounces. The apparent discrepancy that seems still to remain between theory and practice is in reality due to the facts: first, that the free alkali (potash in particular, formed in the solution of the gold, or added to neutralize the free acid in the ore) also dissolves the zinc as potassium zincate; second, that an excess of potassium cyanide dissolves the zinc on its own account, both as the double cyanide and as the zincate of potassium; third, it should also be remembered that water containing dissolved oxygen attacks metallic zinc quite vigorously, forming hydrate of zinc.

I do not consider the reactions which I have suggested as demonstrated. I have considerable work outlined on this subject which is not yet finished, and the opinions here expressed are provisional. It is not improbable that the reaction by replacement and the more complicated one that I have suggested may both take place under certain conditions of concentration and temperature which are not yet understood. It is also possible that the nature of the reaction changes after the first deposit of gold.*

However the theory of this subject may finally turn out, and even granting that, given indefinite time and zinc-shavings, it may be possible to remove all the gold from an aurocyanide solution in the absence of free cyanide of potassium, it is still practically true that it is impossible to remove all the gold from a cyanide solution in a reasonable time, say twenty-four hours, unless there is an excess of about $\frac{1}{10}$ or $\frac{2}{10}$ of 1 per cent of free cyanide of potassium. This is all the more necessary in large scale work, as fine ore-silt and the oxidizing effect of dissolved oxygen nearly always leave the shavings in the zinc boxes more or less coated with films, which increases the difficulty of an intimate contact of the solution with metallic zinc.

*Mr. Alfred James in a valuable paper on "Cyanide Practice" read before the Institution of Mining and Metallurgy, London, May 25th, 1895, calls attention to the inadequacy of the substitution reaction in explaining the precipitation of gold in the zinc boxes. He doubts the action of KCy on the zinc, to any appreciable extent, and calls attention to the fact (as per Ellsner's reaction:

$$2Au+4KCy+H_2O+O=2KAuCy_2+2KHO)$$

that KHO is always present in the cyanide solution. He then suggests the following reaction in explanation of the precipitation of gold in the zinc boxes:

$$(a)\quad Zn+2KHO=K_2ZnO_2+2H;$$

"then as Feldtman has pointed out, the nascent hydrogen reduces the gold,"

$$(b)\quad 2KAuCy_2+2H=2KCy+2HCy+2Au;$$

then he adds that a subsequent reaction takes place as follows:

$$(c)\quad 2KCy+2HCy+K_2ZnO_2=ZnK_2Cy_4+2KHO.$$

When we come to study these reactions, however, it must be evident that we may combine reactions (*a*), (*b*), (*c*), into one reaction, for they really occur simultaneously. We have then:

$$(d)\ 2KAuCy_2+2KHO+Zn=2Au+ZnK_2Cy_4+2KHO.$$

It must be further plain that if we subtract the 2KHO (which appears unchanged in this reaction) from both members of equation we have (*d*):

$$(e)\quad 2KAuCy_2+Zn=2Au+ZnK_2Cy_4.$$

In short, it appears that the explanation of Mr. James brings us back to the old substitution reaction which he started out to avoid. His reactions also fail to explain the increase of free alkali which everyone recognizes as taking place in the zinc boxes.

(To be Continued.)

*Colorado meeting American Institute of Mining Engineers, Sept., 1896. (Revised Proofs Dec. '96.)

Scientific Progress.

Measuring the Earth.

An arc 3000 miles in length, which has been in process of measurement by triangulation for a period of over thirty years, showing the curvature of the earth's surface on this hemisphere, was completed by the United States Coast and Geodetic Survey last month.

The enterprise was inaugurated by President Jefferson in 1807, but no active progress in pushing it was recorded for many years later. Since 1874, several parties of civil engineers have been at work almost steadily between the Atlantic and Pacific coasts, making the triangulations for the big arc, under the direct supervision of the different coast and geodetic survey superintendents. These earth measures worked in general line toward one another from both sides of the continent. About the middle of the month the two base lines from which the closing calculations have been made were verified. One was drawn in the State of Kansas, and the other in Salt Lake valley, Utah.

P. A. Welcker, of the Survey, speaking of the work says that the general purpose in measuring an arc across the American continent is primarily to get the true curvature of the earth on this hemisphere. An accurate survey, something that was never before reached, is also desired. Surveys are generally made on the basis that the surface of the earth is flat.

This country is co-operating with all the other civilized countries for the common purpose of getting a new figure of the earth established to supersede the figure now in use. Bessel's ellipsoid, the first figure of the earth used by scientists, was established from data collected by the Germans. The next ellipsoid—the one now accepted—was established by Clarke, an Englishman.

In 1874 an international agreement was reached among the civilized nations to take measurements for another ellipsoid—one that will be practically true. Every Government of consequence in the world has since been engaged in measuring out an arc on the surface of the globe. The arc in this country is the longest measured by any one nation.

All surveys in this country are to be corrected by the arc measured out from the Atlantic to the Pacific. The ordinary surveys are inaccurate, as the surveying engineers do not allow for the curvature of the earth. In surveying a State, they measure from county to county, and the consequence is that the surveys thus made overlap each other.

Two years ago the connections between the Eastern and Western parties of engineers were made at Mount Ebert and Ouray.

A longer arc than ours is the one measured conjointly by England, Germany and Russia. These countries combined on one arc and France and Spain on another. The English have also done a good deal of triangulation measuring in India.

It will probably be a year before the calculations are all completed and a true figure of the earth is established. The arc in this country will be combined with all the others established over the globe and the mean curvature of the earth's surface thus obtained. It is expected that the triangulation calculations, combined with the use of the pendulum, will give us the length of the earth's diameter to a degree of accuracy within a possible difference of 50 feet from the exact diameter.

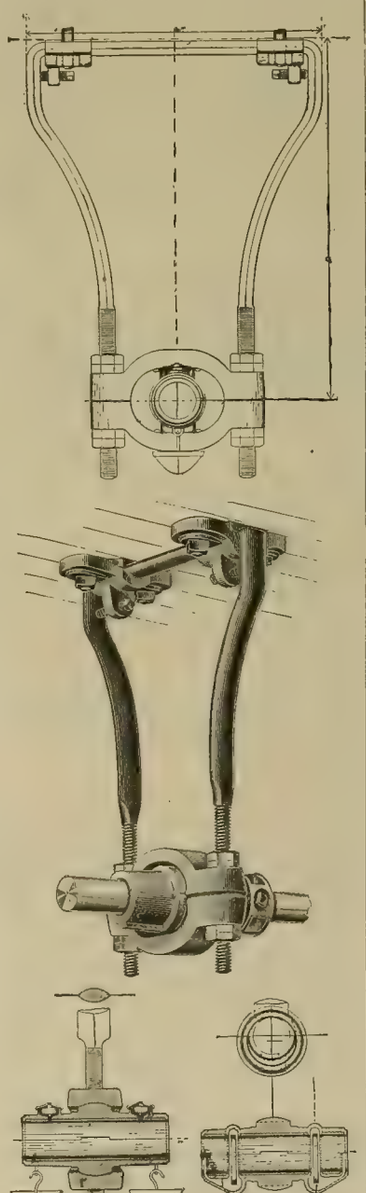
In taking measurements here the engineers first strike a straight line from five to seven miles in length. This is their base line. From this base the engineers then spread out with triangles and quadrilaterals, so as to reach lines of twenty-five miles. From figures they spread out into lines running from 100 to 190 miles in length.

In connection with the work of triangulation just finished, another party of Coast and Geodetic Survey engineers have been engaged in running a line of levels across the American continent. This latter is being done for the purpose of accurately establishing altitudes. These had heretofore been fixed chiefly by the railroad companies. The line of levels will run from Sandy Hook, N. Y., to San Francisco. It took over thirty years' work in making tide observations on the Atlantic and Pacific to get true sea levels as a preliminary to the altitude survey. The line of levels has reached Kansas from the New York end, where operations on it were suspended about two months ago.

Determining of Carbon in Iron.

Engineer Peipers of Remscheid has introduced a method of determining carbon in steel similar in principle to the assay by touch in use for gold. A series of test bars of known carbon contents, and varying from each other by about 0.2 per cent, between the limits 0.2 per cent and 1.2 per cent, form the touch needles, while touch stone is represented by a slab of hard biscuit porcelain. The bar is hammered and filed to a blunt conical point, which leaves a black mark when rubbed on the porcelain slab. The sample to be examined is rubbed upon the center of the plate, to form a patch of about the breadth and length of the finger, a similar one being made on either side of it with two of the bars whose composition is known. The chief point to be attended to is to make the patches uniform in depth of tint, which can be readily done with a little practice. The marked slab is then immersed to about half its depth in a breaker containing 12½ per cent solution of copper-ammonium chloride in water, which dissolves away the iron, leaving the carbon behind as a gray stain, whose intensity increases with the percentage proportion. Steel with about 1½ per cent of carbon is nearly as dark after as before immersion, while that with 0.25 gives only a very pale shade when the iron is removed. If the metal were perfectly free from carbon, the mark would be completely dissolved.

Numerous substances have been tried for streak-plates, including agate, hard glass and feldspar, but none of them has been found equal to unglazed porcelain. In its ordinary state, however, the latter is too rough to abrade the metal equally. It must be rubbed down with coarse emery cloth to render the surface sufficiently uniform. The markings may be nearly completely removed by washing in water, but a more satisfactory method is to clean the slab by immersion for fifteen minutes in nitric or hydrochloric acid, which removes rust spots and stains and restores the original white surface. The method is capable of indicating differences of 0.05 per cent or 0.025 per cent of carbon under favorable conditions.



Changes in the Elasticity of Iron.

Wrought iron and steel are more apt to tear and to break than was supposed generally in former times. It has to suffer from exterior influences, as wear and tear, shock, tension and rust. A piano string of 1-10 inch thickness can stand a burden of up to 500 pounds without breaking, but bent several times in different directions it would lose one-half of its carrying power. By the sharp bending the small crystals of the original structure of the iron have changed position, and thus lost their hold in each other. Iron and steel remain crystalline substances, which fact cannot be altered by any chemical process. As another example we could take the axle of a locomotive, which is manufactured to stand eight to ten times as much wear as is ordinarily demanded of it. Yet after a shorter or longer time of use it will break suddenly by reason of the continual shocks and jolts to which it is subjected, for iron has the property to return to its original state when exposed to shocks; it loses in elasticity, and, finally, it breaks. As wrought iron suffers greatly from changes of temperature, expanding in heat and contracting in cold, defects in bridges and other structures arise. All these structures are exposed to wind and weather; while in the day time the iron parts are heated by the rays of the sun, at night they cool off quickly. As iron is very sensitive, a continual difference of length is caused in the traverses and diagonals, riveted and bolted together as solidly as possible; the original length is never accurately recovered, but the crystalline structure of the iron parts is loosened gradually; the shocks caused by the traffic over a bridge are yet to be added. Iron bridges, therefore, should be carefully examined from time to time, and worn-out parts replaced immediately by new ones. Finally, a fourth example may be cited. The chain of a crane in a covered room, which is not exposed to rust-creating humidity and is warranted to carry a burden of 500 pounds, may, after years of use, break suddenly while carrying only one-half that burden. In carrying a load the links of the chain have the tendency to contract in the middle, and a certain tension is caused, by which the crystalline and apparently fibrous structure of the links is destroyed, which may easily be the cause of serious accidents if the chain is not examined at certain intervals.—American Manufacturer.

Mechanical Progress.

Steel Frame Hangers.

Herewith are illustrated Giant steel frame hangers, as manufactured by

Cup-Oiling Bearing. Self-Oiling Bearing.

the J. B. Johnson Co., Gouverneur, N. Y., constructed upon lines calculated to insure maximum strength of material employed, and of a character possessing high resistance to the strains subjected to in use, avoiding unnecessary weight upon the timbers to which the shafting is attached.

Lubricating Oils.

In an address to the Association of Mechanical Engineers at their recent meeting in Providence Mr. George R. Babbitt said that previous to the discovery of petroleum, fish oils were more generally used for lubricating than any other. About thirty-three years ago petroleum began to be produced in large quantities, but the world was slow to realize its value. There are few places where one cannot get better results with mineral oil than sperm oil. At the time sperm was generally used in cotton mills the spindles ran about 3000 or 4000 turns a minute, while now the speed is from 8000 to 10,000. The lubricant should be adapted to the nature of work to be done. A very heavy, slow running bearing requires an oil of density and high in viscosity, and a high fire test. Heavy quick running bearings are best lubricated by oils of lighter gravity and high in viscosity. Light and quick running bearings are best lubricated by oils of light gravity and low viscosity. The lighter gravity of oils are subject to evaporation, which may result in making them worthless. The animal oils are produced by being pressed from lard, tallow and cattle hoofs. Winter pressed oil means that the material from which the oils are to be pressed is first chilled with ice or mechanical refrigeration, making it clear of stearine matter. This process reduces the quantity of oil that can be pressed from the animal material, and consequently the oil costs more than that known as weather made oils. Animal oils range from 23 to 24 gravity Baume at 60° F., and are very low in viscosity as compared to mineral oils of the same gravity. When crude oil is taken from the ground it is of a dark red color, but in a mass it looks black or green. The oils from Pennsylvania and West Virginia are the best for lubrication. The best spindle oils are prepared by filtering through bone charcoal. The cheaper lubricating oils are made clear by the parafe or acid process. Paraffine oils, on account of the acids used, stain fabrics. Bone filtered oils are first distilled to the desired gravity, and then percolated through the bone charcoal, placed in a series of pans contained in an upright cylinder. The first oil passing through is white, but as the charcoal absorbs the coloring matter in the oil, the oil begins to show color, light at first and darker afterwards. To make clear oils the charcoal must be changed each time, and they are, therefore, more expensive. They are used when the fabric manufactured on the machinery is to be bleached or dyed in delicate shades. Petroleum lubricating oils range from 22 to 40 gravity Baume at 60° F., the flash being from 300 to 400° F., and their cold test from zero to 35. Cylinder oils are made from the crude after the lighter or more volatile products have been taken out. The gravity of cylinder oils ranges from 25 to 28° Baume, the flash point from 450 to 580° F., and the cold test from 30 to 60° F. Experience has taught that a combination of mineral and animal oils makes the best cylinder lubricant.

Japanese Secret Alloys.

The following is the composition, according to the *Iron Industry Gazette*, of a number of Japanese alloys, hitherto kept a close secret, and now revealed by workmen engaged in making them: The "shadko" is an alloy of copper and from 1 to 10 per cent of gold. The objects are placed in a mordant of sulphate of copper alum and verdigris until they have assumed the coppered or blue-black hue of swordsheaths and decorative articles. "Gni-shi-bu-ichi" is a copper alloy with 30 or 50 per cent of silver of the well-known gray color. "Mokume" is a compound of several alloys. About thirty plates or foils of gold, "shadko," copper, silver and the

last-mentioned alloy are soldered together, holes are made, the plate hammered out and put in the mordant.

The finest Japanese brass, "sinchu," consists of 10 parts copper and 5 of zinc. Bell metals, "karakane," are made of 10 parts of copper, 4 tin, ½ iron, 1½ zinc, the copper being melted first, and the other metals added in the above order.

Electrical Progress.

Electric Traction Under Steam Railway Conditions.

In a general way it may be stated that the only methods of electric traction that have so far demonstrated their ability to perform such work as would be required on surface steam railroads are some modification of the much-abused trolley system, said H. M. Brinkerhoff before the American Institute of Electrical Engineers at Chicago. This may take the form of an overhead contact or of a third rail; but the principle of a continous conductor fed from a central station with a direct current of from 500 to 700 volts is common to all.

We have an example of the overhead arrangement on a large scale in the Baltimore & Ohio tunnel equipment at Baltimore. There they are hauling probably the heaviest train units ever successfully handled electrically, and are in fact doing the work of the largest steam locomotives under strictly steam railway conditions. This, of course, does not allow of the best economy being obtained, but it demonstrates the ability of electric motors to do even this extremely heavy class of work.

In order to supply the large amount of current required on this system the overhead contact arrangement used is necessarily heavy and hence expensive. The cost of this particular form must be so high as to make it unavailable for lines of any great length.

The N. Y., N. H. & H. R. R., on their Nantasket Beach line have successfully operated an overhead system. The difficulty experienced here was, I believe, in keeping the trolley on at high speeds, and that this, with other considerations, has proved a drawback is emphasized by the fact that this road is now experimenting with a third rail system.

Other companies might be mentioned who are running lines with a few cars as they say, "experimentally." These, however, are sufficient to show that a genuine effort is being made by steam railway managers to get at the facts as to whether there is any economy to be gained by the substitution of electricity for steam on some of their lines.

In a general way I do not see that there are any insurmountable obstacles in the way of installing an electric system on surface steam railroads following either the line of an overhead or third rail system.

With such experience as we now have, by giving proper consideration to details and the requirements of the service, we should be able to design a system that would give very satisfactory results.

The question whether it should be a third rail, overhead or storage battery, is simply a matter to be decided by the conditions on the particular system considered, and a careful estimate of first cost and maintenance.

Extracting Ore by Magnetism.

Daily press accounts of the Edison process of extracting iron ore by magnetism, as in operation at the plant in New Jersey, give the following:

There are three sets of the magnets—74 in the first set, 320 in the second, and 320 more in the third set. The magnets are about 4 feet long, and the ore, on its journeyings, has to pass a mile of faces of magnets. Right here is presented what to the layman is a most remarkable feature of the process. The magnets are arranged in tiers of five in a tier. The top one is weak, but they increase in strength as they go down, until the bottom one is very powerful.

The ground rock passes through the screen and starts downward in front of the magnets. The magnets jerk the particles of iron oxide from the mass as they descend, but the iron does not adhere to the magnets. And right here is a most surprising sight. The ore, in passing the first magnet, inclines toward it. As it rushes down, the ore swings in more toward the magnets, until, as it reaches the last one, it curves inward and under it in a half-circle, without any particle of ore adhering to the magnet.

In the first passage past the magnets, small quantities of stone stick to the ore. The ore is carried upward and started down before the second lot of magnets, after passing through a mill, which grinds off the particles of stone. The first set of magnets extract 62 per cent of oxide of iron. When the mass has passed the second set of magnets, there is in it 75 per cent of oxide of iron. Then it is ground again and passes the third and most powerful set of magnets, which takes the phosphates out and makes Bessemer of it.

Electricity in Surgery.

A Cincinnati surgeon has constructed and tested what is known as a cataphoresis outfit, by which anesthesia is produced by an electric current and a surface application of some one of the well-known anesthetics. By means of it a loss of feeling in the member operated on is produced without the loss of consciousness or the danger attendant upon the use of ether or chloroform. One may witness the surgical or dental operation and be entirely free from pain during it. The invention is founded on what is stated as a well-known fact, viz: That an electric current will tend to carry a substance from the positive to the negative pole. This is the principle made use of in electro-plating, and it is the same that is made use of in his new apparatus. All that is necessary to accomplish the desired results, says a description of the apparatus, is that the subject that is to undergo an operation shall be charged with electricity from the negative electrode of a battery. An application to the affected part, a tooth, for example, is then made of cocaine or other drug, and the positive electrode, consisting, in the case of the treatment of a tooth, of a needle, is then brought in contact with that part to which the drug is applied. The current then finishes the work by carrying the anesthetic into the tissue or into the nerve of the tooth, rendering the nerve completely insensible. As long as the electricity is applied, the current will flow from the positive to the negative electrode, and with it will be carried the drug to whatever extent is required. The effect will last according to the strength of the current, the time of application, the amount of the drug, and many other conditions, it being entirely dependent upon such known qualities that, with the successful regulation of the current, the exact result of the application can be foreknown.

ACCORDING to the London *Electrical Review* an interesting process is now being conducted at Charlottenberg, Germany, by M. Mehner, by means of which ammonia and nitrides are produced. Oxygen compounds of such elements as boron, silicon, magnesium, titanium and vanadium, capable of combining with nitrogen at high temperature, are exposed to the heat of an electric farnace in the presence of free nitrogen and carbon. A high tension current must be employed and a jet of sand blown in whilst generator gas is introduced; on entering the hot zone of the electric furnace the sand is said to evaporate and then acts as desired. Nitrides thus manufactured may be treated with steam to obtain the ammonia and an oxide from which a nitride may be re-formed as before.

THE use of electricity has called 13,117 patents into existence in the way of generation; 2019 in electrical railways, and 141 in electric brakes.

Practical Information.

Metric Conversion Table.

The following metric conversion table, which has been compiled by C. W. Hunt, could be with advantage pasted by engineers in their note books:

Millimeters multiplied by .03937 equals inches.
Millimeters divided by 25.4 equals inches.
Centimeters multiplied by .3937 equals inches.
Centimeters divided by 2.54 equals inches.
Meters equals 39.37 inches. (Act of Congress.)
Meters multiplied by 3.281 equals feet.
Meters multiplied by 1.094 equals yards.
Kilometers multiplied by .621 equals miles.
Kilometers divided by 1.0093 equals miles.
Kilometers multiplied by 3280.7 equals feet.
Square millimeters multiplied by .0155 equals square inches.
Square millimeters divided by 645.1 equals square inches.
Square centimeters multiplied by .155 equals square inches.
Square centimeters divided by 6.451 equals square inches.
Square meters multiplied by 10.764 equals square feet.
Square kilometers multiplied by 247.1 equals acres.
Hectares multiplied by 2.471 equals acres.
Cubic centimeters divided by 16 383 equals cubic inches.
Cubic centimeters divided by 3.69 equals fluid drachms (U. S. P.).
Cubic centimeters divided by 29.57 equals fluid ounces (U. S. P.).
Cubic meters multiplied by 35.315 equals cubic feet.
Cubic meters multiplied by 1.308 equals cubic yards.
Cubic meters multiplied by 264.2 equals gallons (231 cubic inches).
Liters multiplied by 61.022 equals cubic inches. (Act of Congress.)
Liters multiplied by 33.84 equals fluid ounces (U. S. P.).
Liters multiplied by .2642 equals gallons (231 cubic inches).
Liters divided by 3.78 equals gallons (231 cubic inches).
Liters divided by 28.316 equals cubic feet.
Hectoliters multiplied by 3.531 equals cubic feet.
Hetoliters multiplied by 2.84 equals bushels (2150.42 cubic inches).
Hectoliters multiplied by .131 equals cubic yards.
Hectoliters divided by 20.42 equals gallons (231 cubic inches).
Grammes multiplied by 15.432 equals grains. (Act of Congress.)
Grammes multiplied by 981 equals dynes.
Grammes (water) divided by 29.57 equals fluid ounces.
Grammes divided by 28.35 equals ounces avoirdupois.
Grammes per cubic cent. divided by 27.7 equals pounds per cubic inch.
Joule multiplied by .7373 equals foot pounds.
Kilograms multiplied by 2.2046 equals pounds.
Kilograms multiplied by 35.3 equals ounces avoirdupois.
Kilograms divided by 1102.3 equals tons (2000 pounds).
Kilograms per square cent. multiplied by 14.223 equals pounds per square inch.
Kilogrammeters multiplied by 7.233 equals foot pounds.
Kilograms per meter multiplied by .672 equals pounds per square foot.
Kilograms per cubic meter multiplied by .026 equals per cubic foot.
Kilograms per cheval vapeur multiplied by 2.235 equals pounds per horse power.
Kili-watts multiplied by 1.34 equals horse power.
Watts divided by 746 equals horse power.
Watts divided by .7373 equals foot pounds per second.
Calorie multiplied by 3.968 equals B. T. U.
Cheval vapeur multiplied by .9863 equals horse hower.
(Centigrade multiplied by 1.8) plus 32 equals degrees Fahrenheit.
Francs multiplied by .193 equals dollars.
Gravity, Paris, equals 980.94 cent. per second.

The Deepest Bore-Hole.

The deepest bore-hole in the world, says Mr. C. Zundel, in a late communication to the Industrial Society of Mulhouse, is one of 6571 feet below the surface of the soil, made at Paruschowitz, near Rybrick, Upper Silesia. The previous record for depth was the hole drilled some years ago at Schladebach, near Leipsig. The latter bore-hole was made in a search for coal measures, and 83 separate seams, some of considsiderable thickness, were penetrated. The hole was 12 inches in diameter at the beginning, and this was lined with a tube about 0.4 inch thick; at a depth of 230 feet the bore was reduced to 8¼ inches in diameter, and thus continued for 351 feet. At this point the blue marl encountered became so compact that the diamond drill had to be used, and, under the action of the water, the marl swelled to such a degree that the diameter of the pipe had to be again reduced. The greatest difficulty encountered was the great weight of the boring rods, as the depth increased. Though steel was used, at a depth of 6560 feet the total weight of the tools reached 30,155 pounds. Under this weight, ruptures of the rods were frequent, and an accident of this nature finally stopped the work; about 4500 feet of rods fell to the bottom, and, being jammed under a part of the tubing, it was impossible to withdraw it. The diameter of the well at the bottom was 2¾ inches. Temperature observations made showed 12° C., or 15° F., at the surface, and at the depth of 6571 feet the temperature reached 69.3° C., or 157° F. This is equivalent to an average augmentation of heat of 1° C. for every 34.14 metres of depth, or 1° F. for every 63 feet.

The boring at Paruschowitz was commenced on March 26, 1892, and it reached its maximum depth on May 17, 1893, or in 399 working days. The total cost was $18,800, or about $2.86 per lineal foot.

THOSE who are engaged in foundry practice are apt to consider the cupola and molding room as the chief consumer of iron. Just to show an example of what becomes of some of the millions of tons of iron ore brought to the surface yearly, it may be mentioned that a building now being erected in New York will consume in its construction no less than nine thousand (9000) tons of steel work to form its framework. This is as much as would be required to lay 100 miles of track with 50-pound rails, and shows that if the foundries are not doing much, and railroad is building almost at a standstill, there is still to be found a market for an enormous amount of iron.—The Foundry.

FOUR months ago there was a rule placed in effect on the Galveston, La Porte & Houston railway that hereafter engineers would be compelled to pay for all stock killed by them on that line, and since then the amount paid for dead cattle has not exceeded $20 per month, while heretofore it had amounted to nearly $1200 per month. The officers of the company say that the killing of the stock, in a great measure, is due to the negligence of engineers, and the method adopted by them has proven successful. The same order was placed in effect on a small road in Alabama several years ago.

DR. BOLLINGER, director of the Anatomico-Pathological Institution in Munich asserts that it is very rare to find a normal heart and normal kidneys in an adult resident of that city. The reason for the kidney disease is the tax put upon these organs by the drinking of excessive amounts of beer, and the cardiac hypertrophy and degeneration are secondry lesions for the most part. Formerly, the population of the city was recruited by accessions from the country, but the abuse of beer has spread now to the rural communities, so that this source of healthy new blood is cut off.

A SCIENTIST says that only 900 persons in 1,000,000, according to medical authority, die from old age, while 1200 succumb to gout, 18,400 to measles, 2700 to apoplexy, 7000 to erysipelas, 7500 to consumption, 48,000 to scarlet fever, 25,000 to whooping cough, 30,000 to typhoid and typhus, and 7000 to rheumatism. The averages vary according to locality, but these are considered accurate as regards the population of the globe as a whole.

THE steel umbrella frame has almost superseded the old wooden one, but it has one drawback. If the owner of such an umbrella should be carrying his steel frame in the vicinity of the electric light or trolley wire and should happen to touch the wire with the steel point of the umbrella, he would receive the full force of whatever charge the wire carried in his arm.

WHILE paper is being used for dozens of purposes formerly monopolized by wood, or even a harder material, such as car wheels, boxes, barrels, tubs, pails, etc., wood is rapidly driving other ingredients to the wall in the manufacture of nearly all the cheaper grades of paper.

Subscribers and Advertisers.

Many years ago the writer, in conversation with the proprietor of a trade journal in this city, suggested that new subscribers should be secured. "Damn the subscribers," was the answer; "the advertisers are the fellows I'm after." That trade journal is dead. No man will advertise unless he gets satisfactory answer thereto, and a paper that is valueless to advertisers is equally worthless to readers.

In assuming business management of the MINING AND SCIENTIFIC PRESS it was believed that the best business policy would be to let the advertisers alone, assuming that they best understood their own business, and to direct the greatest effort to increase the circulation of the paper. An advertisement is of value only when seen by men most likely to be customers. A trade announcement as sometimes printed in a paper published apparently only for private distribution among a few competitors is of no value. On the other hand, to make a paper of value to advertisers by securing subscribers by the thousand, it must be made of sufficient interest and value to induce those thousands to subscribe for it for the news and information it contains. Hence with the one idea in view to increase the subscription of the paper solely on its merits, and without resorting to any meretricious schemes or inducements, a systematic effort for the last two years has resulted in an enormous increase in the circulation of the MINING AND SCIENTIFIC PRESS. Of course this has cost considerable money which was not spent in soliciting subscriptions, but in making a paper that men want for its value to them, and not for the sake of any proffered "premium" or because the paper was forced on them. How well this idea has succeeded is illustrated by the increase noted above.

Following is a list of new subscribers received in twenty-one days—from Dec. 5, '96 to Dec. 26, '96:

CALIFORNIA.

It will be noted that the above list contains 213 new subscriptions received at this office during the three weeks from Dec. 5 '96 to Dec. 26, '96, inclusive. It is cited as being a part of the reports of this office handed to the writer for inspection during the current week. It is to be understood that the above are *new* subscribers during twenty-one days, the usual weekly lists of renewals not being included. These 213 new subscriptions constitute only a very small segment of a very large circle, but show the vigor and vitality of the paper.

This fact illustrates the growth of the number of this paper's readers perhaps better than any other statement could. It also makes evident the fact that the MINING AND SCIENTIFIC PRESS is not purely a local publication; it covers its chosen field in this west half of America. It further shows that, by this paper, the attention of miners everywhere is directed to San Francisco as the great mining center, and is thus believed to be of direct benefit to this city; and, finally, is suggestive of the great increase in the mining activity in this country. Of course, were there no such interest in mining, there would be no such demand for this journal, for no amount of effort could so greatly increase the number of readers unless the industry that it represented was a lively one.

The force of all this is manifest to the advertiser. While no special effort is made to induce merchants and manufacturers to make business announcements herein, yet as a rule live business men realize that a paper read by so many thousand probable customers everywhere is necessarily the best medium in which to advertise what they have to sell. An advertisement, after all, is only a bid for prominence, and those who get the most prominence get the most for their money. A good deal of good money is fooled away in advertising in journals that have no circulation and are therefore of no value.

The thousands of names on the subscription lists of this paper and the weekly sales of the news agents throughout the country furnish no fair idea of the number of our readers. Frequently one copy of the paper is passed around through six or eight different hands, and then mailed elsewhere. A case in point came last October from a little mining town in Arizona. A mine superintendent wrote ordering his paper changed to a post-office address in Mexico, where he would be for the next year. In three weeks after the change was made five new subscribers had sent in a year's subscription from that camp. Evidently five men in that one place had each individually decided to take the paper himself after this. It may also be stated that, in accordance with its usual experience, during the twenty-one days in which, as shown above, 213 new subscriptions were received, there were but 17 discontinuances—from the usual variety of natural causes. This paper holds its subscribers, old and new, and the discontinuance of a subscription, except from the ordinary fluctuations of life, is so rare an occurrence as to be remarkable.

To speak of these business matters at such length may appear to be in bad taste, but a fact that has been so often kindly and widely commented upon by so many of our contemporaries, and a condition of affairs so manifestly satisfactory to thousands of readers and well-wishers all over the country, is deemed worthy of such public and extended notice as it herein receives.

Do You Know THAT THE . . .

MINING AND SCIENTIFIC PRESS

HAS THE LARGEST CIRCULATION OF ANY PAPER OF THE KIND IN THE COUNTRY? : : :

. . THAT IT IS THE ONLY PAPER OF ITS CLASS . .

THAT GIVES THE EXACT FIGURES OF ITS CIRCULATION?

It is Weekly Read by More Than 20,000 Men in Every Department of Mining and Mechanical Industry.

IF you want your business advertisement seen by the *MEN TO WHOM YOU NATURALLY LOOK FOR BUSINESS* put it in the

MINING AND SCIENTIFIC PRESS.

ESTABLISHED MAY, 1860.

A paper that has led in its line for thirty-six years must have the qualifications that entitle it to the patronage of intelligent men who realize that, while advertising pays, money is thrown away that is given for advertising in papers with no circulation and which give no results.

It is not what advertising costs, but what it produces, that determines its value.

The MINING AND SCIENTIFIC PRESS produces satisfactory results to those who use it. : : : : : :

Economy is the judicious expenditure of money. It is sometimes economy to save ten cents; it is sometimes economy to spend a thousand dollars. Economy in advertising means to put your advertisement where it will do you good.

Success or failure depends upon profitable advertising. Our patrons find an investment in our columns a profitable one.

J. F. Halloran.

The Mineral Output for 1896.

The following letter from John J. Valentine, President of Wells, Fargo & Co., gives their estimates for 1896 of the yield of precious metals:

The following is our annual report of precious metals produced in the States and Territories west of the Missouri river (including British Columbia) during 1896, which shows in the aggregate: Gold, $54,399,242; silver, $35,784,963; copper, $28,869,305; lead, $7,236,026. Total gross result, $126,289,536. The "commercial" value at which the several metals named herein have been estimated is: Silver, 67 cts. per oz.; copper, 11 cts. per lb.; and lead, $3 per cwt.

Allowance must always be made for probable variations from reported figures, by reason of constantly increasing facilities for transporting bullion, ores and base metals from the mines outside of the express and the difficulty of getting entirely reliable data from private sources. Estimates obtained in this way are liable to be exaggerated and are, to a considerable degree, guesswork; but with some modification on this account, made herein, the general results reached, while only approximately correct, may be accepted as the closest approximation possible under the circumstances.

States and Territories.	Gold Dust and Bullion by Express.	Gold Dust and Bullion by Other Conveyances.	Silver Bullion by Express.	Ores and Base Bullion by Freight.	Total.
California	$11,553,928	$7,973,376	$ 83,839	$ 20,248	$15,631,391
Nevada	1,081,656	950,000	478,814	248,894	2,759,364
Oregon	1,746,752	203,452	96,784	25,000	2,071,988

Independence—from 1822 to 1873	809,655,251
Republic—from 1875 to 1896	569,346,066
Total	$3,530,583,277

San Francisco, Dec. 31, '96. JOHN J. VALENTINE, President.

Mining Summary.

CALIFORNIA.

Amador.

Republican: At the Anita in drifting north from the shaft at the depth of 500 feet a well defined ledge has been struck. There is a rich streak about 18 inches wide, the whole ledge being about 8 feet thick. All of it will pay to mill.

At Pine Grove the Dane mill has been started on good rock.

At the Lombard the company is preparing to put up a 40-stamp mill.

Record: A body of rich milling ore has been encountered in the 900 and 1250 levels at the South Eureka mine and the mill has resumed operations.

On the 700-level at the Central Eureka mine a drift has been run south 200 feet on the vein and it is still going ahead.

Dispatch: A good body of ore has been struck in the Amador Queen No. 2, 1280 feet from the mouth of the tunnel. Mr. Gould has twenty men employed in the mine and will start up the mill in about ten days. It is intended to sink a shaft on the Badaracco ranch 2000 feet deep, and Mr. Gould goes to London soon to complete the preliminary arrangements.

Charles Mitterbauer recently made a strike in the Wild Bill mine, near West Point, which shows a ledge of rock that will average $35 per ton.

The shaft at the Bellwether mine is now down 300 feet and a drift has been started eastward. They have struck a good body of ore in the drift, which assays well.

The work of repairing the shaft at the Zeila is progressing favorably, but it will be a couple of months yet before the work of taking out ore will be resumed. The mill is still on rock from the Argonaut mine.

Ledger: The Kennedy mine has produced during the last ten years $3,580,000, of which $2,000,000 has been dividends. The output for the year just closed was $371,000. This is a low yield for this mine, owing to the low grade of ore, but it is now working in better rock. The ore body has grown wider from the 800-foot level and reached 30 feet at the 2100 level. The vein seems to be wedge-shaped, with the edge upward. Orders have been given to sink another 200 feet. This mine is now the second deepest gold mine in the world. The shaft from top to bottom, allowing for the incline, measures 2450 feet.

Haskins and Chase, who are working the Burse mine in Pioneer creek, have bought the Baker mine, near West Point, and are sinking a shaft and driving a tunnel. They have placed a contract for a 10-stamp mill.

Cuneo & Harmon, who own the Missouri mine, have four men at work taking out ore preparatory to making a test crushing.

A rich shoot of ore has been struck in the Union Consolidated.

Butte.

Register: At Enterprise Fred Bachman is down 260 feet on the ledge and the rock shows three feet of excellent ore. He runs four stamps by water power and gets good returns.

At the Golden Fissure, or Shaw & Watson mine, they have a 5-stamp mill run by water. Their ledge is about 3 feet wide and prospects well. They are down 100 feet on the ledge, and will start a lower tunnel shortly.

At the Crystal Peak mine, owned by Alm Bros., they have three ledges. One is undeveloped, on the second they have run a tunnel 180 feet and struck the ledge fully 100 feet down. The vein is from 4 to 6 feet wide.

From thirty-five to forty men were at work in the Magalia, from twelve to fifteen men at the Princess and sixteen men at the Peter Woods mine, of which E. C. Paxton is superintendent.

Mercury: The Burlington Consolidated Mining Company of San Francisco, which own three claims west of Forbestown, are pushing development work. They have made several short crosscuts from the old tunnel ahead on the ledge. The ledge is about 7 feet wide and is of very good-looking rock, heavy with sulphurets.

On the Costize mine, on McCall creek, they have a ledge which ranges in width from 18 inches to 12 feet and can be traced the full 1500 feet of the claim. They have started a tunnel which will tap the ledge 250 feet below the cropping.

At the Missouri mine, Wilkie and Fennimore have encountered some stringers of quartz and believe they will strike the ledge within a few feet.

Democrat: At Enterprise, on the Oregon quartz mine, owned by Josiah Champion, he has men at work in a tunnel which now is in over 400 feet. The lode promises well and he will erect a mill as soon as the tunnel is finished.

J. O. Carlisle has a quartz claim near Enterprise with a 5-stamp mill crushing the rock.

Shaw, Mearch & Watson have a well-defined lode claim and are working the rock in a 4-stamp mill.

The Alm brothers have a 2-stamp mill working quartz from a claim near the middle fork of Feather river, and they say the working tests are such as to warrant erecting a larger mill.

Calaveras.

The Boston mine people are enlarging the shaft to three compartments. They have about 100 feet to go to reach the bottom.

El Dorado.

(Special Correspondence).—The shaft on the Blanchard mine has reached 157 feet. The company is sinking a winze from the 57-foot level. The new 5-stamp mill is running steadily on good ore.

Gravel properties about Newtown, ten miles south of here, are receiving merited attention. The Rio di Oro hydraulic plant is running day and night. This property comprises over 600 acres.

Activity on the Pine Hill Gold Mining Company's properties, nine miles west, continues. The main shaft is 200 feet, with a 217-foot drift from this level. On the 150-foot level a drift runs south 280 feet, and another to the west 284 feet. The company owns 206 acres. They have crosscut, to date, three large ledges of good grade ore.

The transfer of the Griffith Consolidated, four miles southwest of Placerville, from C. F. Bryant to E. A. Stent is of record. The sale of this property by Mr. Stent to J. D. Gow has been noted by the San Francisco dailies.

The Big Sandy at Kelsey has reached 240 feet in the shaft. Considerable drifting has been done north and south and crosscut several ledges, but the foot wall has not yet been reached. Mill tests of the ore have yielded $35 per ton in free gold. There is a system of ledges and they widen as depth is attained.

The Amazon, two miles north of Kelsey, is drifting on the 200-foot level. W. R. Chadbourne of Leadville is operating the property and working three shifts.

Alderson & Brown began development work this week on a property of magnitude four miles southwest of town. They have grouped into one property the patented claims known as the Essex, Edna, Cincinnati, Rattler, Champion, Keystone and Concordia, now known in the United States patent as the Eden Consolidated. The reopening of these properties, with the determination of going to great depth, will aid partially to demonstrate to a certainty the golden future of El Dorado county.

Placerville, Jan. 19, '97.

Kern.

Californian: W. C. Campbell, a placer miner, has become interested in several claims near Kernville and has invested $40,000 and is now buying up adjacent claims and is having considerable freight shipped in.

Several parties of prospectors are settled at Piute and are systematically at work.

W. C. Wilson of Mojave has sold out his mine in the Slate Range district for $16,000 cash.

The Good Hope is now bonded for $125,000 by the Kenyons to Smith and Centre of Pasadena. The bond runs until February 1.

J. J. Brown of Leadville and James A. Shinn, his expert, have been investigating Randsburg. Mr. Brown has put in between $20,000 and $30,000 and has bought nine claims.

Nevada.

Transcript: Rich gravel has been struck in the Odin drift gravel mine. Work at this mine was resumed only a short time ago, under new management, and the strike was made in a new drift that is being run for the channel.

Union: The owners of the Bellfontaine in Willow valley are desirous of developing the property and erecting a mill, and have decided to sell 25,000 of the 100,000 shares for a working capital.

Cline, Burton and Sleeper have a bond on the Lord mine, adjoining the Red Hill, west of Grass Valley.

Herald: The Gold Point mine, Grass Valley, is turning out $15 ore.

Transcript: In the Washington district Hayes Bros. are finding big nuggets and coarse gold in their gravel mine.

The Washington mine has been examined by experts, with a view to purchasing and reopening the property.

At the California mine Supt. Harmon is pushing the tunnel ahead rapidly, and expects soon to cut into the ore shoots that paid so well in the upper workings.

Work is soon to begin on the Giant King mine and on Worthley & Co.'s claim.

Telegraph: On the Omaha group of mines work is being actively prosecuted southward in the development of the Homeward Bound property, lately purchased. No. 8 drift encountered the shoot of ore a few days ago, the vein averaging from 1 to 3 feet in thickness, and stoping and underhand work are also being actively prosecuted. The Omaha has a 28-stamp mill, which is going to its full capacity. There are now employed sixty men, besides about thirty tributers.

At the Bullion mine, which is opened by a three-compartment shaft, one pumping and two hoisting compartments, work is progressing steadily. The shaft, which is now down 760 feet, is being run to cut the 800-foot level, from where it is the present intention to turn a drift south to cut the old "Ione" shoot of ore. There are at present about twenty-five men employed. It is the intention of the company to put up a 20-stamp mill in the near future.

Placer.

The Grand Victory Mining Company has been incorporated with a capital of $120,000 to work property located on Fall creek, about nine miles from Emigrant Gap. The mine is a gravel one, and will be worked by the drifting process. They have a shaft about 80 feet in depth. Further progress was stopped by encountering a large quantity of water.

Sentinel: A prospect stamp mill has been erected at the Blackhawk gravel mine, near Forest Hill.

The mill at the Redstone quartz mine, near Blue Canyon, has been started up. The company is working quice a force of men.

San Bernardino.

Independent: The report that work at the old Gold Mountain mine, at Bear valley, had been entirely suspended, was erroneous. Work will continue along the line laid down by Superintendent Church for those who have bonded the property from E. J. Baldwin.

Siskiyou.

News: Dannenbrink Brothers, on Know Nothing creek, are working on the 1300-foot

level, where the vein is 4 feet wide, the ore averaging about $50 per ton.

The Salmon River Hydraulic and Ditch Company keeps three giants running and is opening up some rich gravel in the old channel.

Deistlehorst & Barton dredger, at Oak bar, is taking out good pay $40 to $60 each shift. The company intend to build another dredger on the river above the Freshour ferry.

Neil & Wentzel are taking out good ore in the upper level of the Nebraska mine, on Cherry creek.

G. H. Goss has another pay chute in the Drummer Boy, on Cherry creek.

Mann & Bogard have found good pay in Poverty Point, near Oak Bar, a claim they leased from H. J. Barton.

Trinity.

Journal: At Coleridge there are twenty stamps running on the creek—five at the Yellowstone, five at the Enterprise and ten at the Star.

At the Star mine they are running the south drift ahead on the ledge, which is now 6 feet wide in the face of the drift and looks well. The mill is running day shift on good ore.

The winze in the Lone Jack mine has opened up a large body of good ore.

Tuolumne.

Union-Democrat: The Mammoth mill is being prepared for treating the high-grade ore. The stamps are in and the concentrators will be ready by the first of February.

The Gerrymander mine is being worked by its new owners, with J. L. Joseph as superintendent. A 5-stamp mill is on the property, and this will be overhauled and in working order inside of a month.

At the Confidence ore is being extracted from the 800 level and crushed by the 30-stamp mill. Good milling ore is found on the various levels.

At the Star a chlorination plant of three tons capacity has been put in.

Citizens of Jamestown have organized a company to work the old New York drift gravel mine on Table mountain, which yie ded half a million dollars in 1854-56. Litigation stopped operations and the claim has lain idle ever since. At present nine men are employed.

Chronicle: At the Belleview mine, taken hold of under bond by the California Exploration Company, the 5-stamp mill has been closed down and two shafts will be sunk to a depth of 760 feet. If the ore body shows up as expected, it is the intention to erect a 60 stamp mill.

Independent: The Santa Ysabel Mining Company is erecting a 20-stamp mill, the grading for which is almost completed. Sinking still goes on in the three shafts and crosscutting. Shafts No. 1 and No. 2 have recently been connected and connection with No. 3 will shortly be made.

Work on the Last Chance placer mine at Montezuma has been resumed.

The Golden Gate mine is running full force night and day and the quality of the sulphurets is richer than ever.

The Jumper mine will shortly use electricity for power.

The Golden Rule mine is sinking and crosscutting and the quality of the ore proving very satisfactory.

The Isabella & Gem mine, owned by J. Faxon, is liable to be opened up again shortly.

Yuba.

At New York Flat, in Yuba county, south of Forbestown, T. H. Steel is working his claim by hydraulic process under a permit from the Debris Commission. He has seven men employed. He is working in low ground and uses a hydraulic elevator, which, with a 4½-inch nozzle, 16-inch truck and 325-foot pressure, raises the water and gravel to a flume 23 feet above bedrock.

Near New York Flat, A. F. Roberts is working an extension of the old Deadwood ledge. He has a tunnel in over 500 feet.

NEVADA.

White Pine *News*: In the Granite district, east of Egan range, the Ben Hur, a new discovery, was recently sold by W. D. Campbell to Salt Lake people, who will operate it with a large force of men. This sale has attracted the attention of prospectors, and they have located a number of claims, which show large ledges carrying gold and silver.

De Lamar *Lode*: At State Line a new strike of very rich gold ore has been made by Hicks Brothers and Mesher on the Nevada side of the line.

F. N. Millett has incorporated the Gold Hill Milling and Mining Campany, Provo capitalists furnishing the money to drive a 400-foot tunnel on the property.

Mr. Christie is soon to close a deal with the Eagle Valley district claim owners.

The strike at the Magnolia has drawn attention to that locality. In the main body is a seam of ore which at times shows free gold. Much of it shows valuation of over $200 in gold and as much as 60 ounces in silver.

The Austin Mining Company's new mill will be in operation in ninety days.

The Keystone mill has been started up.

Elko *Free Press*: Bald Mountain, Ruby Mountain district, White Pine county, has taken on a lively appearance within the past six weeks, consequent upon the arrival of a number of Elko and Eastern mining men. Denver and New York capitalists are getting hold of a large amount of mining property with W. B. Duvall as their superintendent.

In the Salmon River district, in the northeastern part of Elko county, about 100 men are mining. Last summer some Montana men began the erection of a 30-ton smelter, which was started up last week. Coke will come from San Francisco. The ores of the district run high in copper with some silver and gold. Among the mines working are the Brooklyn, owned by English & Co. This company has about 250 tons of ore now ready for the smelter and teams are hauling it for reduction.

A number of promising mines have been opened within five or six miles of the smelter. Good ore, containing copper and silver, is being taken out.

OREGON.

BAKER COUNTY.

The Alturas Mining Company is spending $1000 a month in development.

The Virtue mine has a new hoist, with capacity to sink to a depth of 2000 feet, the first step toward really deep mining in Oregon.

The North Pole mine and mill are in full activity. As soon as the raise to the surface is completed there will be room for 100 miners to work. It is proposed to enlarge the mill.

Grants Pass *Observer*: J. E. Brown has a 30-foot tunnel on Mt. Reuben, adjoining the Ajax, which shows a ledge of 7 to 8 feet of solid ore.

C. A. Wilcox of Wimer, on Evans creek, will put a pipe and giant on his placer this season.

George Darwin, superintendent of the Jewett mine, has put a force of men at work driving a lower crosscut tunnel to cut the lead at a depth of 160 feet below the present workings.

Nearly all the bars along Rogue river between Woodville and the mouth of Galice creek have been located and many pumping plants will be worked next season.

Medford *Monitor-Miner*: The Bonanza mine recently turned out in twenty-six days' run $20,000 in gold.

The newly discovered mine, the Jumbo, owned by James & Myers, on Catherine creek, east of Union, was bonded recently for $65,000 to St. Louis capitalists.

The Black Channel gold mine, on Foots creek, is being worked by about sixty men, under the management of Superintendent Shotwell.

A deal has been closed by some Eastern parties for the ranches belonging to McDougal, Mardon, Hall and Mrs. Birdsey, on Kane's creek, near Gold Hill. The purpose is to use the land for gravel mining. The consideration is about $30,000. It is the intention to run a large ditch from upper Bear creek.

WASHINGTON.

Spokesman-Review: The Bridgeport Mining and Development Company at Conconully have a group of fourteen claims on which a development tunnel has been started and will be continued until it is in 1500 feet, at which point a vertical depth of 800 feet will be attained. In the process of this work at least a dozen veins which appear on the surface will be cut.

Within a few miles of Loomiston, Okanogan county, prospectors have discovered a 14-foot ledge of rich ore, traceable on the surface for 4500 feet. Crosscuts were made at a depth of 40 feet, assays running from $11 to $35 a ton. Samples of the ore are not distinguishable from the ore of the Le Roi mine, and it was the similarity of the iron capping to that found in the Trail district that led to the discovery of the mines.

Spokane *Chronicle*: The owners of the Old Dominion, at Colville, have spent about $600,000 in developing it until now there is over 15,000 feet of work completed. The main tunnel is in 3000 feet, which gives a vertical depth of 800 feet and on the dip of the vein 1200 feet. During the last three years they have purchased fifty-two additional properties. As soon as the new machinery arrives, seventy-five men will be put to work and the tunnel will be pushed on 3000 feet more.

BRITISH COLUMBIA.

Spokesman-Review: Preparations are being made to start the Volcanic property, near Grand Forks, on or about March 1st. Enough capital has already been guaranteed to fully equip the mine for extensive development. This and other work contemplated will mean the building of a large smelter near Volcanic mountain and the encouragement of a railroad into Grand Forks before the 1st of next September.

The Seattle Company will also start work on its property about that time. A shaft is to be sunk 200 feet.

There are twelve mines up the North Fork and around Grand Forks being worked at present with good results, and most of the money furnished comes from Spokane.

The Pathfinder property, now under bond to Rossland and Toronto parties, has been announced to start work soon after March 1st.

The following is the output of the Slocan district for the first week of 1897:

Mine.	*Tons.*
Payne, Slocan	306
Slocan Star, Sandon	200
Surprise, Slocan	17
Idaho, Slocan	80
Enterprise, Slocan	40
Jackson, Slocan	61
Ruth	15
Rambler, Slocan	16
Wonderful	30
Blue Bird, Slocan	12
Antoine, Slocan	17
Whitewater, Slocan	90
Last Chance, Slocan	51
Washington	32
Reco, Slocan	88
Consolation, Slocan	12
Total for week	1,179
Approximate value	$140,670

At Rossland a syndicate from Toronto has closed a deal for the Silent Friend, a claim adjoining the Commander, and work will commence in a few days under the new company.

One of the most important strikes of ore ever made in a Trail Creek mine has been uncovered in the O. K. It was in the stopes upward from the eleventh tunnel, and was a streak of perfectly free-milling ore.

A three-fifths interest in the Edith, Arm and Hammer, Hidden Treasure and City of Spokane mineral claims, near Nelson, Galleger, Blaine and Stoll, has been bonded to English parties for $10,000. The first payment has been made.

UTAH.

Salt Lake *Tribune*: At Mercur the management of La Cigale will not undertake the erection of a mill on that ground until more ore has been blocked out.

The management of the Rover has been directed to proceed with the development of the property.

The property of the Rover has already been quite extensively explored, the workings at present covering 1600 feet.

At Lion Hill the mill at the Northern Light is nearing completion and will start up on sixty tons a day. Forty-five men are now constructing the pipe line, which will cover a distance of 15,000 feet. With reference to developments on the mine, Superintendent Hines reports the vein now opened up for 2½ miles, beginning at the Monarch No. 3 and connecting with what is known as the Winter Quarters claim. Concerning the ores, he says the whole will average about $19 in gold and $12.62 in silver.

On the McKinley mine they are drifting on the vein and have already uncovered ore running from 10 to 6600 ounces in silver.

At Park City the winze being sunk from the 1500-foot level in Ontario shaft No. 2 is down 130 feet, all in good ore. Twenty-five cars of ore are being taken out every twenty-four hours, and, as soon as stoping will be begun on the 1700-foot level, the output can be made to exceed 100 cars.

At Fish Springs the Utah and Galena mines make regular shipments and are steadily improving with development.

The Emma property, now under bond and lease to the Bradshaw brothers of Lehi, has improved greatly in the last two months.

At Bingham the owners of the Highland Boy will in a few days let a contract for erecting one of the largest mills in Utah. Meanwhile the blocking out of ore is progressing steadily and already there is enough in sight to run the mill for a long period.

The Bingham Copper Company is now below the water level in its search for copper, and important results are expected.

The Yosemite No. 2 has been purchased by the Sampson Mining Company. It is understood that the consideration was a large block—about one-half of the 500,000 shares of the Sampson Company—so that the transaction was in effect a consolidation.

Mammoth *Record*: Water in the Undine has been increasing so rapidly that it was found impossible to run more than one shift a day profitably. A tank has been erected, and teams are now hauling water to the various other properties in the vicinity. A mine of water in this district is somewhat of a bonanza itself.

The Sunbeam shaft is going down at the rate of 3 feet a day. The formation at the bottom of the shaft is changing rapidly, and the indications are that ore is not far away.

Excavations have been completed for a new hoist at the Southern Eureka.

Tintic *Miner*: Work has commenced on the old Park mine, recently purchased by Riter and Loose. A new incline shaft will be sunk on the vein.

Kirby and Cobb, with their Salt Lake associates, have closed a deal for the Pride of the Hills group.

A strike is reported this week in the Ajax on the north drift from the 400-foot level.

Eureka *Democrat*: A steam hoist is to be put in at the Homestake, and will be in operation within thirty days. The shaft is now down 265 feet.

Work has begun on the May Day, and a tunnel is being run to tap the bottom of the shaft, which is down 63 feet, where the indications are such that, with a small amount of drifting, the Humbug vein will be reached.

IDAHO.

Spokesman-Review: The Standard mine, in the Cœur d'Alene district, distributed $400,000 in dividends among its stockholders last year.

Miners from the Pierce district report snow falling. Placer miners are pleased over the prospects. The heaviest snow storms usually prevail in January and February in the mountains.

The tunnel in the Bimetallic group will be driven 200 feet more, which will tap the main ledge.

The progress in the gold fields of Florence during the past year has been devoted principally to preparatory work for the present year. Altogether, there has been about 3500 feet of tunnel driven and nearly 1500 feet of shaft sunk on claims in the various parts of the camp. Ore from many of the claims has been worked in the new custom mill, giving average results of $40 a ton.

A scheme is on foot to tap by a tunnel the ore bodies of the Florence district. Florence is 4110 feet above Salmon river; at the wire bridge the altitude is 2165 feet above sea level. The depth thus obtained by the proposed tunnel exceeds 4000 feet, and in this distance there are ledges carrying gold every 100 feet from Florence to the Salmon river, a distance of eight miles.

From the Pierce district in 1895 about $30,000 worth of gold dust was shipped, while the figures of shipment for 1896 sum up a little over $100,000.

MONTANA.

Butte *Miner*: The Boston and Montana Company's concentrator, at Great Falls, which has been closed down for several months, started up last week and forty new men were put to work. Several matte furnaces have started up, and from this time on the whole plant will be kept in continuous operation.

The Vulcan silver mine will start up about February 1, and nearly 100 men will be given employment. This mine has been closed down since the great decline in the price of silver bullion, and has filled up with water.

In the Colusa Parrot the 1200 level has been reached, and a station is being made. Another 100 feet will be sunk before exploring will commence by cross-cutting. In the meantime ore is being shipped from the upper levels.

Butte *Mining and Railway Review*: A rich body of ore, 3 feet wide, which carries a large percentage of copper, has been discovered in the tunnel in the rear of a livery stable at Wickes.

A 20-stamp mill is to be built at the Mammoth mine, near Shoup, Lemhi county. The property was recently sold by A. Torpence to an Eastern syndicate, and extensive development will be pushed during the winter.

SOUTH DAKOTA.

Black Hills *Times*: The following figures, which have been obtained from officials and annual reports of the companies mentioned, can be verified at any time. They show plainly the rapid increase of production made by the richest 100 miles square on earth, known as the Black Hills district:

Mine.	*Tons Treated.*	*Value.*
Homestake	285,000	$1,572,000
Highland	192,300	737,000
Deadwood-Terra	204,000	400,000
Apex Consol	8,120	24,000
J. R	1,600	15,000
Keystone	18,600	85,000
Holy Terror	10,000	72,000
Deadbroke	7,500	50,000
St. Elmo	1,200	15,000
Grizzly Bear	1,850	12,050
Hawkeye	8,300	22,000
Columbus	1,000	5,000
D. and D. Smelter	132,000	1,960,000
Union Hill Smelter	4,300	55,000
Golden Reward	48,117	998,000
Cyanide Mill	25,033	398,000
Kildonan Mill	33,943	700,000
Ores shipped	43,000	1,075,000
Placer mines, estimated		25,000
Total for 1896	1,013,560	$8,235,000
Total for 1895	833,800	4,910,000
Increase	179,760	$3,325,000

It must also be remembered that these figures do not include the bi-product of silver and copper, neither do they include the product of several small quartz mines in the vicinity of Central City, nor those of Garden City and Carbonate Camp. The *Times* believes that if the actual gold product of the Black Hills for 1896 could be arrived at, the amount would be nearer $12,000,000 than the total expressed in the figures given above.

The Union Hill Company are pushing work in all directions on their large holdings and getting out enough ore from the present openings to supply a plant of 100 tons daily capacity.

A diamond drill capable of sinking 2500 feet will soon be in operation on the Gold Belt and Alaska group of claims in Ragged Top camp, owned by General Green B. Raum and associates.

The Swamp Eagle lode, on the Poorman divide, has resumed work and will open up the large body of free milling cement ore which is known to extend through the claim.

NEW MEXICO.

Santa Fe *New Mexican*: In the Carlisle gold district of Grant county, where for several years the Steeple Rock Mining Company has been successfully operating, the Exploration Company of London, backers of the company, have quietly secured control of 125 promising gold prospects in the district and have about completed arrangements for extensive development. The plans of the Steeple Rock Company contemplate the reduction of 1000 tons of ore per day in the course of a few months. Huntington mills will be operated in connection with the chlorination process.

The site for the smelter of the Mary Mining and Smelting Company at Cerrillos has been practically decided upon. It consists of about fifteen blocks in the original town of Cerrillos, north of the San Marcos arroyo. The property is owned by Senator Elkins of West Virginia.

Silver City *Enterprise*: At Pinos Altos the Treasure Mining Company, of Denver, Colo., is working about fifty men in the Atlantic mine and mill. This company is making preparations to start operations upon the old Deep Down property, which is also owned by the company. This will give employment to twenty or thirty more miners.

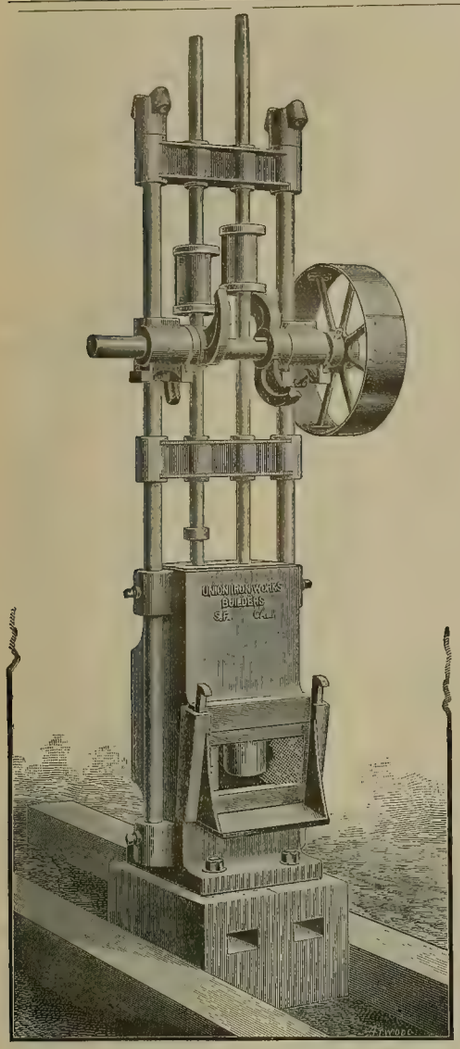
At Pinos Altos A. Hersberger is working ten men on the Western mine. He will have a mill-run made at the Stanley-Martin mill next week.

Spiller and McLean are again working the Pacific Gold Company's claim on the Pacific vein. They are running ten stamps of the company's mill, near Silver City, concentrating the ore.

At Gold Hill the Woods mill is running daily on ores from the Woods prospects.

The Western Belle has started up again, and, if satisfactory results are obtained, another mill will be built.

The Standard Company will start up soon.



ARIZONA.

Tombstone *Prospect*: The Old Glory mill has closed down. It has ore crushing capacity for only twenty stamps and is adding enough ore crushers to supply the thirty stamps at the mill. The capacity of the reservoir is also to be increased; during the meantime development work continues on the mine.

Phœnix *Republican*: Work on the new smelter belonging to the Empire Smelting Company at Rollin is progressing and it will soon be ready to blow in.

There is a promise of some business for Gila Bend, growing out of the development of mining properties in the neighborhood. Recent new discoveries are looking well, and parties are now on the way to inspect them.

At Goldfield many claims are being developed. About seventy-five men are kept employed constantly at the Mammoth mine, and the 20 stamp mill is kept busy.

PROSPECTING BATTERY.

UNION IRON WORKS,

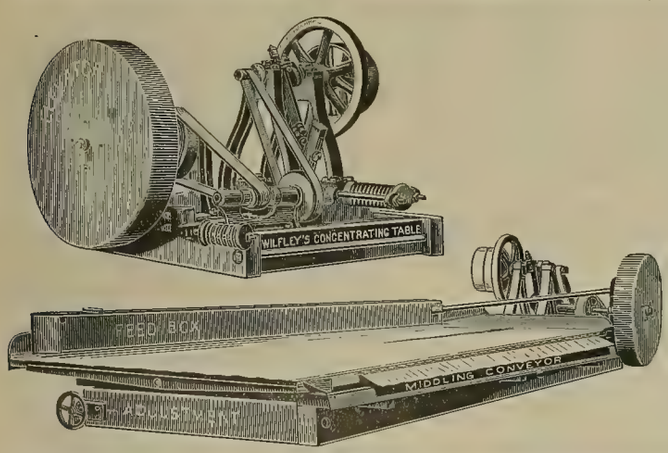
222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS



Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

The Mine and Smelter Supply Co.,

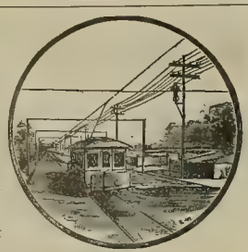
. . . DENVER, COLORADO, . . .

ARE SOLE AGENTS FOR THE

Wilfley Concentrating Table,

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Anyone can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; M. E. Smith Concentrator, Golden, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; W. H. Bellows, Boyd Mill, Boulder, Col.; H. E. Woods, Denver, Col.



These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

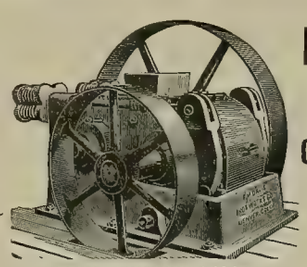
PRICE, $450.00.

It Is a Fact

THAT OUR ANNUAL PRODUCT OF . . . . . .

INSULATED WIRE

EXCEEDS that of any other manufacturer in the United States, and Includes Everything in the Electrical Line. . . . . .



WASHBURN & MOEN MANUFACTURING COMPANY,

8 and 10 PINE STREET, SAN FRANCISCO, CAL.

NOTICE TO ORE SHIPPERS.

By shipping your ores to us you can obtain the highest prices paid on competitive bids in the public market, together with a careful and accurate sample, as with our new mill and improved machinery we are able to give perfect satisfaction to all shippers. *Write for our Pocket Reference Book.* The highest cash price paid for gold bullion and old gold. Prompt returns.

STATE ORE SAMPLING COMPANY, Denver, Colo.

Sacramento, California

Coast Industrial Notes.

—San Diego, Cal., oranges sell in Boston, Mass., for $2.40 per box.

—It is thought in San Francisco that wheat will go to $2 per cental this year.

—Newburg, Or., proposes to spend $15,000 gold bonds for a gravity system of water works.

—Miller & Lux have bought all the sheep feeding in Big Meadows, Nevada, amounting to about 25,000 head. The prices paid range from $2.25 to $3.75 per head.

—Contracts have been let for construction of Gray's Harbor Government light station, to cost $30,000. The contract for supplying metal for the works was let for $7443.

—The W. J. Cox ranch of twenty acres at Azusa, Los Angeles county, was sold last week for $17,000, or at the rate of $850 an acre. It lies one mile east of Azusa and is planted almost exclusively to navel oranges.

—The Blue Canyon Water Company has been incorporated in Sacramento to furnish water for drinking purposes, bringing it to Sacramento from Blue Canyon Springs, in the Sierra Nevadas, in cars to be constructed for that purpose.

—It is thought that the $1,500,000 bonds recently issued by San Diego, Cal., will be withdrawn for a time at least. They were designed to pay for an extensive water system, but City Engineer Capps has refused to accept the dam.

—The House Committee on Public Buildings and Grounds has ordered favorable report on Senate bills authorizing public buildings at Tacoma, Wash., to cost $400,000, at Salem, Or., to cost $100,000, and at Aberdeen, S. D., to cost $100,000.

—Produce exports from San Francisco by sea in 1896 were $43,556,000, against $33,375,000 in 1895, a gain of $10,000,000 last year. Of the total, New York took $3,008,000, Great Britain $16,121,000, Australia $4,743,400, Hawaiian Islands $3,695,400, China $3,193,800, Japan $2,489,300, Mexico $1,441,000, Central America $3,410,500, and South Africa $1,048,300.

—Gen. Nelson A. Miles, chief of the Ordnance Board, says a dispatch from Washington, D. C., has decided to make a demand for appropriations for defense on four points on the Pacific coast as follows:

Location.	Guns.	Emplacements.	Barracks.
San Francisco.....	$363,000	$294,000	$251,050
San Diego.....	271,400	204,000	125,505

—The current freight rate by sailing vessel from New York to San Francisco, round Cape Horn, is about 37½ cents, and 5 per cent per 100 pounds, and this rate is hardly ever subject to a fluctuation of more than 5 cents either way. Rates from the other side rule considerably lower than this, averaging from Liverpool to San Francisco between $5 and $6 per ton of 2240 pounds. The main reason for the cheaper freight rates from England is that the sailing vessels arrive there with cargoes, while they frequently have to come in ballast.

A Handsome Catalogue.

A catalogue is issued by the American Blower Company, Detroit, Mich. The accompanying sketch is a miniature reproduction of the cover. The book, of over 200 pages, is divided into thirteen parts, each devoted to a different subject, and contains new matter of interest to engineers, contractors and architects; new fan and blower capacity tables, etc. Those interested in blowers and mine ventilation should write for the catalogue.

Recent California Mining Incorporations.

Templeton Milling Company, Templeton, Cal.; capital, $15,000; subscribed, $5460.

Sandusky and Oregon Creek Placer Mining Co., San Francisco; capital, $10,000,000; $2500 subscribed.

Selby Mining Co., San Francisco; capital stock, $1,000,000—$500 subscribed; E. J. McCutchen, H. R. Mann, W. H. Martin, W. W. Deamer, V. Neale.

Empress Josephine G. M. & M. Co., San Francisco; capital stock, $500,000—335,000 subscribed: W. O. Frost, R. P. Saxe, L. W. Wilbeck, S. C. Nash, B. G. Smith.

Trinity M. & M. Co., San Francisco; capital stock, $300,000—$500 subscribed; C. H. Fish, H. G. Blasdel, D. E. Hayes, W. S. Chapman, L. L. Bettys.

Webster G. M. Co., San Francisco; W. S. Weymouth, W. C. Lewis, A. T. Dunbar, J. A. Stephens, G. S. George; capital stock $500,000—$250 subscribed.

Recently Declared Mining Dividends.

Mercur, Utah, $25,000, payable Jan. 19th. The total to date is $300,000.

Alice Mining Co., Montana, $25,000, payable Jan. 12th. This is a total to date of $995,000.

Bullion-Beck, Utah, Jan. 20th, 20 cents per share.

Centennial-Eureka, Utah, Jan. 15th, $1 per share.

Galena, Utah, Jan. 11th, 5 cents per share.

Silver King, Utah, Jan. 11th, 25 cents per share.

The Calumet & Hecla Company of Michigan, $1,500,000, payable February 10. This is dividend No. 101, and makes a total of $48,350,000 declared to date.

Personal.

C. L. MORRILL, representing the Johannesburg, Kern Co., Cal., Mining & Milling Co., is in San Francisco to buy a stamp mill for that new camp.

J. J. BROWN and James A. Shinn of Leadville, who have been in the Randsburg district, where they made some investments, are now in San Francisco.

CHARLES BUTTERS has arrived from Salt Lake, where he stayed over on his way from South Africa, to look over the ground with a view to establishing cyanide plants. He will return to South Africa in a few weeks, but expects before many months to come back to California and remain.

AT the forty-fourth annual meeting of the American Society of Civil Engineers in New York City last Wednesday the following officers were elected for the ensuing year: President, B. M. Harrod of New Orleans; vice-presidents, Col. George H. Mendell of San Francisco and John F. Wallace of Chicago: treasurer, John Thomson of New York.

L. P. GOLDSTONE, of Grass Valley, who was formerly connected with the State Mining Bureau, for which he did some valuable work, leaves in a few days for London and will from there go to Coolgardie, Western Australia, to take charge of mines owned by an English syndicate. Mr. Goldstone has for some time been operating mines in Grass Valley.

COLORADO'S GOLD FIELDS.

Millions Upon Millions of Dollars in Gold Have Been Added to the World's Wealth.

It is a well-known fact that the richest and most famous gold mines in the known world are those of Colorado, many of which are paying to fortunate investors millions of dollars annually in dividends Some shrewd persons who invested only a few dollars are now receiving hundreds and thousands in profits, and, judging from present indications, there are more desirable chances to invest just now than ever before. New mines are discovered daily and old ones strike richer veins of gold.

In order to meet the great demand for reliable information about mines and mining camps, one of Denver's oldest and best known publishers has just issued a handsomely illustrated book accurately describing every mining camp in the entire State of Colorado, giving scores of truthful photo-engravings of famous mines, mountains, cities, etc. Cripple Creek, the world's wonder, is fully described; also a correct map of the district. Narratives of how many poor people have become wealthy by judicious investments in gold mines, and sketches of former prospectors who are now fixed for life. Tells how to avoid unscrupulous brokers and sharpers. The volume has been carefully compiled by a disinterested author and every statement made is guaranteed to be true. All terms and phrases of miners fully explained; tables showing the State's production of gold and silver for 35 years past. The publisher will send by return mail a copy of the above great book upon receipt of 25c. (currency or stamps), which also includes a 3-months trial subscription to his big 56-column weekly family paper, the *Illustrated Weekly Sentinel* of Denver, Colorado (established 1890). Clubs of 5 and 5 books, $1. The paper contains each week all the latest mining news and illustrations of Rocky mountain scenery, also true stories of love and adventure Cut this out. Address as above and mention The Press when you write. It is reliable.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from S. J. Holsinger, in the Drummondsville mine, near Forest Home, Amador county, to deposit tailings in Drummondsville creek; and from G. D. Duncan & Co., in the Pebble Bottom mine, near Yankee Jim's, Placer county, to deposit tailings in a ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on January 25, 1897, at 1:30 P. M.

WANTED.—Foreman to run a copper blast furnace, oxidized ores, in West Australia. Salary $175. Expenses out paid. One year engagement. Address ALFRED ROPP, Selby Smelting Works, Selby, Cal.

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Hydraulic and River Miners Handling Boulders Can Easily Remove Them By Using

The Knox Patent Hydraulic Grapple.

IT WILL DO GOOD WORK AND GIVE SATISFACTION.

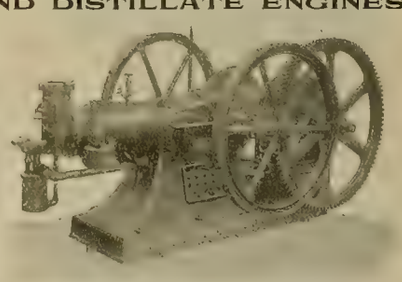
PRICE ACCORDING TO SIZE REQUIRED.

Address WM. KNOX, Jacksonville, Oregon, or JAS. ARMSTRONG, 10 Front Street, S. F., Cal.

HEADQUARTERS.

Genuine English Pump Leather

For Heavy Mining Pump Buckets. Will outwear any other material and give best satisfaction. Samples furnished on application. A. C. NICHOLS & CO., Leather Manufacturers and Dealers, 404 Battery St., S. F.



HERCULES GAS, GASOLINE AND DISTILLATE ENGINES.

HOISTING ENGINES, 2 h. p. to 200 h. p ✦ STATIONARY ENGINES, 1 h. p. to 200 h. p. ✦ MARINE ENGINES, 2 h. p. to 200 h. p.

Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running. Just ½ your expense SAVED BY USING A HERCULES in place of ANY other. We make no exception.

NEARLY 3000 HERCULES HOISTING, STATIONARY AND MARINE ENGINES IN ACTUAL USE. HIGH GRADE.

We claim full power, automatic and positive adjustment regulating speed and consumption of fuel in proportion to work being performed. No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
220 Market Street.....San Francisco, Cal

Assaying.—Part I—Gold and Silver Ores.
Third edition: Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit. Treatment of Ores. etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.
By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers. history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.
By T. E. Van Wagenan.....$1 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Assayer's Guide.
By Oscar M. Lieber.....$1 50

Assayer's Manual.
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

Metallurgy of Silver, Gold and Mercury in the United States.
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Farmers and Miners Uniting.

At a conference between the Senate and Assembly Committees on Mines and Mining and the Committee on Public Works, held at Sacramento last week, there was shown a desire on the part of the representatives both from the farming and the mining districts to do all they could to effect an amicable arrangement by which the different interests may work for the common good. The sentiments expressed went far to show that there has lately grown up a very good feeling between the miners and the farmers.

Senator Doty, speaking for the farmers, said that they should try to get help from the State and get immediate relief, and at least try the experiment of seeing if the river will not carry the debris off through the deepened channel. In the past he had fought the miners, but he felt that it was time for them to pull together, and he hoped to hit on something that would give both relief. He knew the condition, both in the mines and on the river, and would work with the miners to secure good results to both.

Senator Gleaves said that he understood that the proposition was to begin dredging at the lower parts of the river and work upward, and called upon Major Gillette of the United States Debris Commission to explain about the dredger.

Major Gillette said that he did not feel at liberty to speak on all subjects involved, especially for publication, as the commission of which he is a member is considering them and will in due time report on them. The big dredger has been used on the Mississippi for dredging and removing the bars. When the river is either at the high or low stage navigation is good, but when it is at medium height the bars impede navigation. The dredger pumps the sand out to one side and allows the river to deepen its channel by the force of the current. The dredger cost, he thought, $250,000, and will remove 8000 cubic yards of earth an hour, much more than any other machine has done. The river will not receive so much benefit from its taking the material out of its bed as it will from raising the banks, so that they can confine and carry a larger flow of water at flood height. They could not hope to take out enough of the detritus to hold down what is coming down from above. He had no figures to present on the cost of prosecuting the work. That is a subject on which the Debris Commission is working, and he was not at liberty to anticipate its report.

Engineer Price said that they should keep the river in its banks and let it help itself to deepen its channel. Do not expect the dredger to do all the work, but to help clear out the river and make it carry more water.

574,644.—FAUCET FILTER—W. H. Vance, S. F.
574,595.—AIR AND GAS MIXER—N. White, Pasadena, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAN.—James Gould, Jr., Berkeley, Cal. No. 574,730. Dated Jan. 5, 1897. This invention relates to that class of can heads which has flanges adapted to be fitted exteriorly to the can body, and especially those heads adapted by reason of a flange which may be torn open to be called "key-opening" cans. It consists essentially of a body and a head, the head having a deep flange to fit over the exterior of the body and having a portion between its lower edge and the angle formed with the top provided with an inwardly bent portion curved in cross section whereby its lower inner angle with the lower straight portion of the flange forms a positive stop to limit the projection of the head upon the body, a positive circumferential indentation of right angular form in cross section to produce a tearing line at the inner angles of the walls and at a point inside the outer periphery of the can head, whereby it is protected from accidental rupture.

DESIGN FOR PHOTOGRAPHIC CARD MOUNTS.—Paul J. Stuparich, San Francisco, Cal. No. 26,427. Dated Dec. 22, 1896. This invention relates to a design for card mounts and consists essentially of an embossed oval with a crown and branches imprinted upon a roughened surface in the angles of the card exterior to the central medallion.

RAILWAY RAIL JOINT.—Byron Jennings, San Jose, Cal. No. 573,980. Dated Dec. 29, 1896. This invention relates to a device for connecting the meeting ends of railway rails and making a bond and joint to prevent these ends being depressed by the constant passage of heavily loaded trains, and it serves to maintain the level and register of the rails. It consists of a base plate having a depressed section beneath the meeting ends of the rails, a curved spring equal to the depth of the depression, which fits therein, and when straightened out forms a continuous support in line with the higher portions of the plate, so that the rail practically rests upon those parts. In conjunction with these are side plates fitting and bolted to the webs of the rails with flanges bent with relation to the base plate so that the latter is retained in place and the spring maintained in its straightened condition in the chamber. If these rails are to be used to conduct electricity, as for electric roads, a copper surface plate may be extended across the joint so as to make a continuous electrical connection.

MULTIPLE SYRUPING MACHINE.—Frederick A. Robbins, San Francisco, Cal. No. 574,075. Dated Dec. 29, 1896. This invention relates to an apparatus for supplying syrup or other liquid simultaneously to a number of cans or vessels which are to be filled. It consists essentially of a plate, the upper surface of which is provided with horizontal passages, the outer ends of which passages connect with a series of discharge nozzles opening downwardly. The inner ends connect with circle holes or openings extending through a superposed plate and a spring-pressed valve turnable within a chamber upon said plate serves to close or open these passages by means of a lever fixed to the valve stem exterior to the case. Suitable stops in the line of travel of the lever indicate when the valve is opened or closed. This portion of the apparatus is supported above the table which is adapted to contain the cans, which are placed beneath the nozzles to be filled, and a tilting plate is so arranged that the cans resting thereon may be tilted to a certain angle so as to discharge a small portion of the syrup equally from all the cans. Below this tilting plate is a second table with converging grooves or passages, which receives the surplus syrup and returns it to a suitable receiver.

CONCENTRATOR BELT.—Wm. F. Bowers, San Francisco, Cal. No. 575,142. Dated Jan. 12, 1897. This invention relates to that class of endless concentrator belts which are made of rubber and are provided with rubber side flanges, being mounted so as to travel over terminal drums or rollers, and it is designed to overcome the difficulty and expense caused by the cracking and breaking down of these flanges when the belts are stretched in passing over the terminal drums. It consists particularly of a separate flexible reinforcing strip extending through the length of the flanges, this strip being substantially nonelastic. It is preferably made in the form of a cord of any suitable material.

BALANCED SLIDE VALVES.—Geo. R. Herricks, San Francisco, Cal. No. 575,155. Dated Jan. 12, 1897. This invention relates to a means for balancing slide valves of steam or other engines which operate under considerable pressure. It consists of a flanged valve adapted to slide upon the valve seat and open ports through which the steam or other medium is admitted to the engine cylinder. Around the channel formed by the flanges is a loosely fitting yoke which embraces the valve and which is connected with the actuating valve stem, this yoke taking up any irregular movements imparted by the valve stem and allowing the valve to work accurately at all times upon its face. Above the valve and upon the steam chest cover is a short open cylinder within which is fitted a piston. A rod connects this piston with a plate which fits above the valve and which prevents the direct pressure of steam upon the back of the valve, the connection between the piston rod and the plate being by means of a universal joint which allows the plate to always fit the valve with an even pressure. The area of the piston is just enough greater than that of the plate to counterbalance the weight of the piston and the plate and relieve the valve of pressure. In order to relieve the valve from the weight of the plate *E* and piston *B* when the engine is running down grade or without steam, a small cylindrical chamber is extended above the steam chest cover having a piston fitting within it and connected with the rod of the balance piston within the steam chest. A small opening admits steam beneath this small piston at the pleasure of the engineer to a sufficient amount to counterbalance the weight of the interior piston and the plate which ordinarily rests upon the back of the main valve. A central or adjusting screw passing through the steam chest cover is regulated so as to prevent an upward movement of the valve by any pressure liable to produce that result.

SOAP HOLDER AND BRUSH.—Geo. W. Johnson, San Francisco, Cal., assignor of one-third to Philip D. Raine, same place. No. 575,159. Dated Jan. 12, 1897. This invention relates to a device for holding and preserving soap so that it can be readily used at the washstand or point where it is needed, but cannot be carried away. It consists essentially of an indestructible open mesh netting, a hanger into which the mouth of the netting is gathered, and a means for locking it therein after the soap has been placed in the netting. The hanger to which the netting is attached has a swivel so that it may be turned about freely, and from this swivel a suspending cord extends upwardly, and is connected with a spring-actuated roller or with a weight, or by other means so arranged that it will be drawn up out of the way when not in use, but it can be drawn down with very little pressure so as to be used about the wash-bowl and bath-tub when desired. The netting may have a flexible backing fixed to one side with a brush which serves as a flesh or nail brush when desired, the whole forming a very convenient means for keeping the soap within convenient reach for use while preventing its being absolutely carried away from the place where it is to be used.

The New York Herald in its issue of January 3, 1897, devoted nearly a whole page to a notice of the under-mentioned work which it described as being "A Remarkable Scientific Memorial." It also stated that "Nothing more revolutionary than Dr. Emmens' memorial has been advanced in the name of science since the day when Sir Isaac Newton presented to the Royal Society his doctrine of universal gravitation."

The Argentaurum Papers,

No. 1.

Some Remarks Concerning Gravitation,

By STEPHEN H. EMMENS.

CONTENTS.—Foreword; The Newtonian Doctrine; The Defect of Newton's Proof respecting the Centre of Force of a Spherical Shell; The Newtonian Demonstration respecting the Attraction exerted by Spheres upon External Bodies; An Inquiry as to the Reason of the Defect in the Newtonian Doctrine of Attracting Spheres having remained undiscovered until now; The Newtonian Doctrine of Internal Attractions; The Doctrine of Gravitating Centres as distinguished from Centres of Gravity; The Calculus of Gravitating Centres; The Gravitating Centre of a solid, homogeneous Sphere with relation to external bodies; The case of a Spheroid; The Precession of the Equinoxes; The Density of the Earth; The Internal Attractive Force of a Spherical Shell; The Internal Attractive Force of a Solid Sphere; The status of a Solid Sphere with regard to Internal Pressure; The Centrifugal Theory of Cosmical Bodies; The Variation of Density as regards the Earth's Crust; The Significance of Earthquakes; The Temperature of the Earth; The Source of Terrestrial Heat; The Source of Solar Heat; Saturn and Jupiter; The Volcanic Character and Quiescent Status of the Moon; The Obliquity of the Ecliptic; Elevation, Subsidence and Glacial Epochs; The Cooling and Shrinking of the Earth's Crust; The Arch Theory of the Earth's Crust; The cause of Ocean-beds and Mountains; Terrestrial Magnetism and Electricity; The Presence of Gold in the Ocean; The Verification of the Centrifugal Theory; Universal Gravitation; E pur si muove; The Error of the Dyne; The Variation of Products; The Infinite Concomitant of Newtonian Particles; The self-lifting Power of the Newtonian Particles: How two equally-heavy Newtonian Particles, taken together, weigh less than the sum of their separate Weights; The self-contradictory character of the Newtonian Law; The Superior limits of Newtonian Gravitation; The Correlation of Space and Energy; The outline of a system of Universal Physics. Conclusion.—Envoy.

The above-mentioned work is published by the Plain Citizen Publishing Company, 1 Broadway, New York City, N. Y., U. S. A.

A Standard Work.
THIRD EDITION JUST OUT.
Assaying Gold
.....AND.....
Silver Ores.
By C. H. AARON.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

RUPTURE, Hydrocele, Varicocele, Piles, Fissure, Fistula, Ulceration, etc., cured without operation or detention from business. NO PAY UNTIL CURED. Consultation Free. Call or send for pamphlet.
DRS. MANSFIELD & PORTERFIELD,

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

WEBER Gasoline Engine For use in any place or for any purpose requiring power. Only a few minutes' attention required each day. Guaranteed cost of operation is 1 cent per horse power per hour. Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro-Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight, About 5000 Pounds.

It requires no belting, shafting, pulleys, or building.
Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.
Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

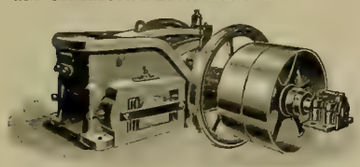
THE FINLAYSON PATENT WIRE ROPE TRAMWAY.

THIS TRAMWAY IS THE BEST THAT HAS EVER BEEN PLACED ON THE MARKET. IT HAS NO RIVAL. IT IS STRICTLY AUTOMATIC AND ITS CAPACITY RUNS UP TO 1000 LBS. PER BUCKET. ANY ONE CONTEMPLATING THE ERECTION OF A TRAMWAY SHOULD INVESTIGATE ITS MERITS BEFORE PURCHASING ELSEWHERE. . . . . .

Standard Silver-Lead Water Jacket Smelting Furnace.

Equipped with Arch-Bar System of Mantles, insuring rigid and strong walls. No Cracks.



THE COLORADO IRON WORKS COMPANY, Denver, Colo.

SOLE AGENTS AND MANUFACTURERS.

WE ARE MANUFACTURERS OF AND CONTRACTING ENGINEERS FOR Gold, Silver, Lead, Copper and Pyritic SMELTING FURNACES.

AMALGAMATION AND CONCENTRATION PLANTS.

Investigate Our Late Improvements in ORE CRUSHING MACHINERY.
We Guarantee Capacity Per Day to Any Degree of Fineness. . . . . .

Improved Black Hawk Ore Breaker.

OUR PATENT HOT BLAST APPARATUS for all Smelting Furnaces is a Success. A great economizer of fuel, and enlarges capacity of furnace.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 21, 1897.

Business is slowly reviving. The purchases so far indicate filling in so as to keep assortments up until personal visits are made to this city for the purpose of spring stocking. The buying of hardware, manufactured iron and similar lines promises to be larger this year than it was in 1896, owing to more building and railroad construction. The indications are at present there will not be any material changes in quotations. There will be also more machinery used for mining and agricultural purposes. So far the rainfalls and weather, not in this State alone, but throughout the Coast, have been all that could be desired, by even chronic pessimists, for the growing crop of cereals, fruits and vegetables. In the San Joaquin valley, southern part of the State and Arizona there has been a heavier precipitation and more generally distributed than for several years. The ground is wet to a considerable depth, which insures moisture for crops well into the spring months, even if there are no more rainfalls. The pasturage is reported better than for fully five years, which will benefit dairymen and stockmen. Prices for all kinds of farm products, unless we except dairy products, promises to average good figures the coming season.

The local money market continues to work on easy lines, with idle funds accumulating at banks. Owing to low rates of interest ruling at the East remitting is slow, but owing to light, comparatively, shipments of products to Eastern distributive points exchange is well maintained. The export value of clearances the past week to foreign and Atlantic domestic ports aggregates over $1,200,000, which is larger than in any one of last year. This is a gratifying showing, and is an important factor in providing more funds for investment purposes and also cancelling obligations. The East reports money still accumulating at New York. The rate of discount on call paper went down to a very low rate last week. Telegrams gave the rate as low as 1 per cent per annum. Short and long time loans were made at the rate of from 2 to 3½ per cent a year. Well informed parties at the East state that in New York fully $50,000,000 of sterling exchange have been borrowed against in that city. Never before in the financial history of the United States has so large a quantity been placed and held at any one time. This precludes any possibility of gold shipments for some time to come. Some authorities think there will not be any during the present calendar year. If it was not for tariff and money tinkering by Congress the very large surplus funds at the East would invite more general investment and speculation. In Europe money is easier but in good demand owing to continued improvement in business.

New York Silver Prices.

NEW YORK, Jan. 21.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 11-16	64¾
Saturday	29 11-16	64¾
Monday	29 11-16	64¾
Tuesday	29 11-16	64¾
Wednesday	29 11-16	64¾
Thursday	29 11-16	64¾

	Copper.	Lead.	Iron.	Tin.
Friday	11 75	3 02½	11 00@13 00	13 15
Saturday	11 80	3 05	11 00@13 00	13 20
Monday	12 00	3 07½	11 00@13 00	13 30
Tuesday	12 00	3 10	11 00@13 00	13 40
Wednesday	12 00	3 10	11 00@13 00	13 40

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	15c Prem
New York Telegraphic Transfer	17½c Prem
London Bankers' 60 days	$4.85¼
London Merchants	$4.84½
London Sight Bankers	$4.88¼
Refined Silver, per oz., 1000 fine	64¾
Mexican Dollars	51¾@52¼

SILVER.—Not within the past five years has the market value of the white metal held at steady prices for two consecutive weeks. The inquiry is fair. The East continues to report a free outward movement. The last steamer for the Orient took out for China $25,500 in bullion and $147,000 for Japan. Mail advices from London furnish the following review for 1896: The high point in silver for the year 1896 was 31 9-16 and the lowest 29¾; average, 30¾. India has been a steady buyer, except for a short time in October, when there was a check on account of the famine prospects. Japan has been a moderate buyer and the Continent has absorbed silver at intervals. The supply has been larger than heretofore, with the excess chiefly from the United States, which has shipped about £2,000,000 more than in the previous year. The imports and exports of silver for ten years follow:

	Imports Silver.	Exports Silver.
1887	£ 7,900,000	£ 7,830,000
1888	7,300,000	7,645,000
1889	10,500,000	10,668,000
1890	12,400,000	10,890,000
1891	11,800,000	13,300,000
1892	13,500,000	14,000,000
1893	14,900,000	15,500,0.0
1894	13,200,000	12,200,000
1895	12,500,000	10,400,000
1896, about	15,400,000	about 14,900,000

The movement of gold has been mainly against this country. Shipments to the United States have been about £10,500,000, while there has been a steady demand from Russia and Germany. Imports and exports for seven years follow:

	Imports.	Exports.
1890	22,568,000	16,000,000
1891	30,300,000	24,500,000
1892	21,470,000	18,060,000
1893	24,200,000	22,500,000
1894	27,600,000	17,200,000
1895	36,000,000	22,800,000
1896, about	24,700,000	about 32,000,000

MEXICAN DOLLARS.—The last steamer for China took out 186,199 dollars. Our market is fairly firm.

ANTIMONY.—Our market is quoted at 7½ @8c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6¼@6⅝c for Hallett's and 6¼c for Japanese.

QUICKSILVER.—The market is practically unchanged, so far as the demand is concerned.

The market is quoted as follows:

Domestic trade, per flask	36 40

For export, quotations are nominal but less than for home.

COPPER.—The market is very strong at an advance, with still higher prices looked for. The consumption abroad is simply enormous, while in this country it is expected to steadily increase. The production, although very heavy, does not keep up to consumption.

The local market is quoted as follows:

Ingot, jobbing	14½@—
Ingot, wholesale	13½@—
Sheet copper	17 @—
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

LEAD.—Not to be behind copper and tin, lead is strong and higher abroad and at the East.

Pig	— @ 3 75
Bar	— @ 4 00
Sheet	— @ 5 25
Pipe	— @ 4 50

SHOT.—There is a moderate demand.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

BORAX.—Shipments to the East are fair. The market is steady.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

TIN.—The markets of the world are higher and strong. It is stated that the advance is due to a strong speculative bull campaign in Europe. In our market consumers are beginning to take hold.

Pig, per lb	14¼c@ —
Plate, I C coke, heavy, per box	— @$4 05
" " " light, "	— @ 3 95

IRON.—The market is practically unchanged. Imports are fairly free with a fair demand ruling. Late Eastern advices report that conditions are extremely favorable for consumption of iron and steel. Prices are very low, machinery is cheap, all other kinds of material are cheap, and labor is abundant. Lastly, the financial outlook is favorable. Prices may be expected to harden before long and therefore the favorable time for undertaking new enterprises involving consumption of iron and steel is the present. Bessemer pig at Pittsburg is showing considerable activity. Prices have been low, but an improvement is likely before long. Prompt iron at Valley furnace has sold $9.75. Steel billets have been offered at makers' mill below $15.50. There is not much chance of the Bessemer Association getting together again. In Alabama the continued selling of iron for export is the only feature. This kind of inquiry continues good.

We quote as follows:

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The market maintains a firm tone for cargoes of foreign in all positions. The consumption of all kinds is large.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 50@ 6 00
Coos Bay	— —@ 5 00
Cannel	8 00@—
Egg, hard	12 00@13 00
Wallsend	— —@ 6 50

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	—
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	9 50	@	— —
" spot, in bulk	10 00	@	— —
" in sacks	11 00	@	12 00
Cumberland	— —	@	— —

LUMBER.—There is a continued free export movement. The home consumption promises to be large.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is unsettled and irregular at lower prices.

Wire, carloads, basis per keg			
" jobbing, " "			$2 40
Cut, carloads, " "			
" jobbing, " "			2 25

POWDER.—The demand is fair.

The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

Mining Share Market.

SAN FRANCISCO, Jan. 21, 1897.

The market which had been gaining strength since the commencement of the current month, strengthened very materially on Saturday under good buying. Monday morning there was a bulge, prices advancing 20 to 40 per cent over Saturday's closing. The advance was short lived for under active selling by shorts and realizing sales of holders Chollar broke from $1.30 to $1.00, Con. Virginia from $1.85 to $1.65. The rest of the list receded proportionately. The decline continued Tuesday morning, when Chollar sold down to 81 cents, Con. Virginia to $1.55 and the others fell off in about the same porportion. In the afternoon of that day a steadier feeling prevailed owing to a stronger tone in Con. Virginia. Yesterday there was free buying of the shares of that mine which advanced the price to $1.85 and $1.90. The balance of the list, outside of the Gold Hill shares, strengthened in sympathy. The latter were weak owing, it is said, to holders getting out so as to buy elsewhere. The bulge in the market on Monday and the rapid break came as a surprise to the large majority of dealers. The quick move up and then down was hailed by brokers as a harbinger of better times for it looked very much to them as if it was being worked by others than chippers and room traders assisted by one or more small pools. There is no person who wishes a bull campaign more earnestly than a stockbroker, for higher prices and active moves bring in outside traders which means commissions for buying and selling. While the market acts well yet it does not have the right ring to it. It does not look as if there are persons back of it who have the means to promote and sustain a bull campaign for a longer duration than a few days. The advance yesterday in Con. Virginia was due to reports of an improvement on the 1000-foot level which brought in outside buyers, all eager to take the shares off the hands of better informed and larger operators. At this writing it looks as if prices may possibly go slightly higher so as to encourage holding and also more outside buying, for assessments must be levied and collected. Experience has taught that no large body of ore has ever been allowed to be discovered, so far as made public, when prices were low, and it is not at all likely that this rule will be changed in the future.

Official letters from the Comstock mines continue to report work being pushed mostly to the west. For the very few miners at work there is a good deal of exploiting and deadwork done. A reduction in men, which has been made from time to time, has been done on the plea of economy, so as to cut down expenses, by which the levying of assessments would not come so often. While this is the reason stated for so few men at work, yet persons in position to judge what is going on in the market, and also what can be done in the mines, if desired, unhesitatingly state that it is for the purpose of killing time and disgusting outside holders so they will sell. In every mine on the Comstock fairly fast work is done when it is in the direction where they do not expect to strike ore, but, if it is in the direction of ore, then a snail's pace is fast in comparison.

In Utah they are running an east cross-drift, but on what level the letters do not say.

In Sierra Nevada they are running a west cross-drift on the Layton tunnel level, and on the 900-foot level they are extending an east cross-drift and a north lateral drift. In Mexican they are running a north drift and also west cross-drift on the 1000-foot level. In Ophir they are raising from the central tunnel level and running a west cross-drift on the 1000-foot level. In all the above they find nothing but porphyry and clay seams. In Con. Virginia they are running a cross-drift from an upraise from the 1000-foot level, near the Ophir line. It is in this cross-drift that reports say there is an improvement. On the 1650-foot level they are casing timbers. On the 1750-foot level active work is being done in several directions. Best & Belcher and Gould & Curry are still running a joint east cross-drift. In Hale & Norcross work is confined to the 900-foot and 975-foot levels. A few tons of ore were raised last week. From Savage no change is reported in the work being done. No work is reported in Chollar and Potosi. In Bullion work is being done on the north lateral drift, while in Alpha they are still fooling away time on the 500-foot level, so as to show others how not to find ore even when it is near at hand. The work in Con. Imperial and Confidence is unchanged. Work was resumed in Crown Point last Saturday. Discreet silence is maintained regarding the work in Belcher and Seg. Belcher. It is the opinion in well-informed mining circles that this silence is due to their having found considerable ore, which they are trying not to let others know about until outside shareholders are assessed out of their shares. Overman reports raising a few tons of ore. They have succeeded in getting away from the ore in Alta, which the superintendent is reported to have said he would strike.

News from the Brunswick lode is confirmatory of what the MINING AND SCIENTIFIC PRESS said about Chollar. We then stated that when they commenced extracting ore it would meet all expenses. This is proving to be the case now, and when they increase the output still more (112 tons were raised last week) then better results will follow. This very extracting of ore takes the shares of the mine out of the market as a gamble, for it is uncertainty and assessments that are the main factors in promoting better and active times, provided the bulk of shares are well in hand. In Chollar they are working on the 200-foot, 300-foot, 400-foot and 500-foot levels.

We furnish the machinery and erect at the mines all descriptions of **STAMP MILLS** for the economical treatment of gold and silver ores. **HOISTING A PUMPING MACHINERY**, operated by Steam, Water, or Electric Motors. **CYANIDE, CHLORINATION AND LEACHING WORKS. COMPLETE CONCENTRATING AND SMELTING PLANTS** for dressing lead ores and smelting for copper and silver. **IMPROVED AIR COMPRESSORS AND DRILLS. WIRE ROPE TRAMWAYS** for transporting ores; **ETC., ETC.**

✦✦✦ Practical Working Plans and Specifications Provided for All Machinery Furnished or Structures Built By Us. ✦✦✦

In the first four they are taking out ore. On the 400-foot level they are sinking to the 500 level so as to make connection for ventilation with the south drift that is being run on that level. In Occidental work is confined to the levels reported last week. Nothing of importance has been struck. In Savage the work is on the 400-foot level. The work in Best & Belcher and Gould & Curry is in the same direction and on the same levels reported last week. It is rather singular that in no mine, outside of Chollar, have they been able to find paying ore. Perhaps it is not desirable. The Chollar letters are explicit and all that can be desired, so far as we know, by shareholders. Some of the companies on the Comstock could follow them with advantage to shareholders and, at the same time, disarm criticism and promote confidence that the mines are honestly worked.

The following illustrates the changes of the week:

Yuma	2.16	4.62	.32	1.90	64	42

*Up to 5 P. M. January 19; furnished by J. A. Barwick.

Commercial Paragraphs.

THE Walker Company, of Cleveland, Ohio, has a contract to install an electric plant in the Waldorf hotel, New York city—the largest isolated plant in the world. It will be able to develop 50,000 lights.

THE Fort Wayne Electric Corporation has secured the services of Mr. Samuel H. Taylor, one of the pioneer electricians of the coast. As representative of the Thompson Houston Company, and later connection with the Edison Light and Power Co., Mr. Taylor has acquired a wide acquaintance and high standing among electricians and business men.

THE Rand Drill Company has shipped to the Le Roi Mining Company, Rossland, B. C., the largest air compressor ever built in Canada. The engines are Corliss compound condensing. The two steam cylinders are 22-inch and 40-inch diameter by 48-inch stroke, while the two air cylinders are 22-inch and 34-inch diameter; the crank shaft which drives the machine is 12 inches diameter; the fly wheel 10 feet in diameter by 40-inch face.

THE result of last year's operations by the F. M. Davis Iron Works Company, Denver, Col., is an indication of the advancement in the mining industry throughout the West. In the manufacture of mining machinery the value of its product for 1896 has nearly doubled that of the three preceding years respectively, requiring the addition of 4500 square feet to the machine shop, giving to the establishment now a ground floor space of 39,500 square feet. The various products of the company are sold mostly in Colorado, while a steady market is maintained in New Mexico, Arizona, Utah, Idaho, Nevada, Montana and old Mexico.

UNDER the pressure of a growing demand for rubber goods the San Francisco branch of the Goodyear Rubber Company has enlarged its warerooms and offices and now occupies the entire building, from roof to basement, on Market street, numbering 573, 575, 577, 579. The interior is fitted with the latest appliances for handling the business. Every imaginable thing manufactured from rubber is represented in the large stock which the company carries. Special mention may be made of the full line of firemen's supplies, hose, belting, packing, and the celebrated "Crack-Proof" pure rubber boot, designed especially for severe use in the mines or for hunting. Catalogues from any of the different departments will be sent on application.

Assessment Notices.

HARTMANN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Chili Gulch Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of December, 1896, an assessment (No. 1) of 5 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 46, No. 4 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of February, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the 23d day of February, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

G. W. PEER, Secretary.

Office—Room 46, No. 4 Montgomery street, San Francisco, California.

MINERAL HILL MINING AND SMELTING CO.—Location of principal place of business, San Francisco, California; location of works, Spenceville, Nevada County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of January, 1897, an assessment (No. 1) of five cents (5c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 210 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 25th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—210 Sansome street, San Francisco, California. Office hours from 1 to 3 o'clock P. M.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of January, 1897, an assessment (No. 5) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 8th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—237 12th street, San Francisco, California. Office hours from 4 to 6 o'clock P. M.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 13th day of January, 1897, an assessment (No. 5) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

Tintic Mining District, UTAH.

The Tintic Mining District lies eighty-five miles south of Salt Lake City on the Rio Grande Western Railway, and is, as shown by the records of 1895 and so far in the present year, the greatest mineral producing district in Utah.

The names of the great bonanzas of Tintic, the Mammoth, Centennial-Eureka, Bullion-Beck, Eureka Hill and Gemini are recognized everywhere that the mining industry is known. The four former have each a record exceeding $1,000,000 in dividends and the latter of over $600,000.

Until within the last two or three years no adequate means of reduction of Tintic ores was in operation in the district and the production of the mines was limited to those ores sufficiently rich to be shipped to the smelters for treatment, but this has been changed by the erection of immense combination and concentra ion milling plants which can work at a profit those immense deposits of low grade ores which fill all the producing mines of the district. Four of these mills are in active operation, and three others will undoubtedly be erected within the next year.

The ores of Tintic are greatly diversified in character. The principal metals produced are gold, silver, copper and lead. In silver production Tintic leads the State, while in the production of gold it stands second on the list. Beside the big bonanzas above mentioned there are some twenty-five or more properties that now and in the past have been producing mines, and to these may be added a score of others which have paid for their development by their products, and upon which the recent revival of the mining industry has had the effect of a recommencement of operations.

Tintic has four thriving towns—Eureka, the business center of the district, with a population of 2,500; Mammoth, population 1,000; Robinson and Silver City, 500 each, all of which offer great inducements for investments in a business way.

At the base of the foot hills only a few miles away, is a valley of 25,000 acres of choice fruit and garden lands, watered by the Mt. Nebo Land and Irrigation Company.

As to the future of Tintic, it is no exaggeration to say that it possesses the brightest prospects of any mining district in Utah, and offers to the prospective inventor opportunities which cannot be excelled.

The Rio Grande Western Railway has a double daily train service between Salt Lake City and the Tintic Mining District. For further particulars apply to F. A. WADLEIGH, General Passenger Agent, Salt Lake City.

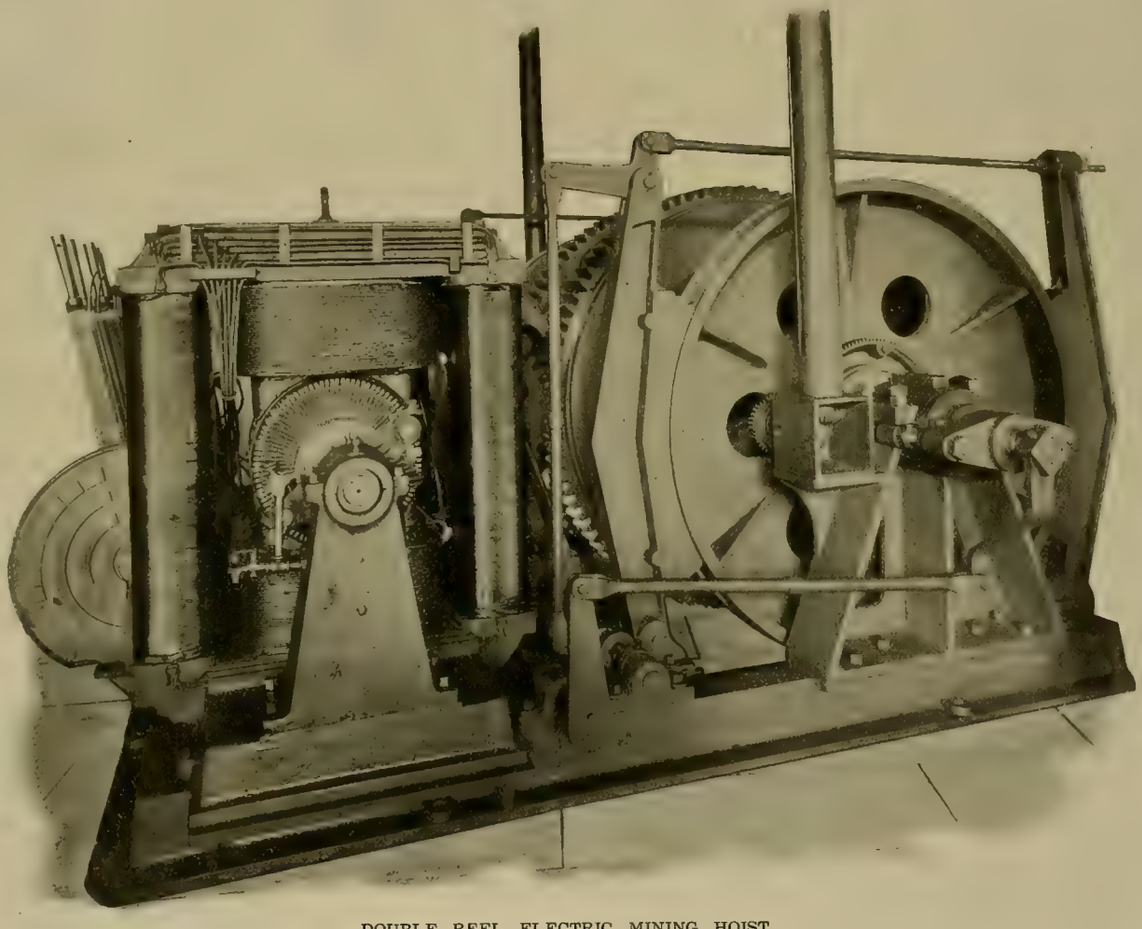
AND PACIFIC ELECTRICAL REVIEW.

No. 1908.—VOLUME LXXIV. Number 5. SAN FRANCISCO, SATURDAY, JANUARY 30, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Protect the Mine Laborer and Supply Men.

It is proposed to secure the enactment by the present California Legislature of a law requiring those who work bonded or leased mines to file with the county authorities bonds for the payment of the labor employed and supplies furnished. Owing to the inefficiency of the mechanics' lien law as it stands at present on the statute book and emasculated by the Supreme Court, the laboring miner has very little protection, and hardly a week passes in which there is not reported a case where laborers have been left without their pay and with no means of securing it from the property itself. Now a lien will not lie against a mine covered by an agricultural patent nor according to a recent decision of the Supreme Court, for work done in any mine in taking out ore even in prosecuting development work, but only in dead work. Nor will a lien lie against a mine held under a Mexican grant. A good lien law covering all work done by laborers in all mines would be satisfactory to the mine owners and give ample protection to the miners. The proposed law providing for a bond from others than owners who are working any mining property would then be of value only to those supplying material, provisions, etc. At present comparatively irresponsible people often bond mines, work them a short time, obtaining credit from supply men, and if the work does not develop values leave the laborers and other creditors unpaid. The worst of this to the supply men is that these laborers often run up bills at the local stores which they cannot pay. It is well known that, owing to losses through the almost universal system of credit throughout the mining districts, prices at local stores are out of proportion to the cost of the goods sold. This works a hardship on whole communities. It does not seem that requiring the proposed bonds would work a hardship upon any one and it should do much good. However, what is wanted most of all is a lien law for the working miner. This has been recommended by the Governor and by the Labor Commissioner.



Deep Shaft Sinking.

A suggestion has been made that some of the mine owners in the Trail Creek district, in British Columbia, combine for the purpose of sinking rapidly a deep shaft in one or more representative claims for the purpose of demonstrating whether the ore bodies hold out in size and value with depth. The suggestion is a good one. The sinking of the Kennedy shaft in Amador county, California, to a depth of 2200 feet, and the proof thereby that the ore body is as large and rich as in the upper levels, has done much to increase the values in the minds of the owners of properties on that belt for a long distance. Had this been done years ago there would now be many more deep shafts along the Sierras than there are now.

In South Africa the deep shafts are proving the value of the mines in depth, and as a result there is no hesitation about sinking on other mines at very great expense. There they had the advantage of large capital which is not as available in this country. A large majority of the mines are being worked by men of small means who can hope to make developments at great depth only out of the profits of the upper workings. Randsburg, in the Mojave desert, is a good example of this. With the most promising outlook on the surface, none of the mine owners have sunk deep enough to prove what they believe that the mines will hold out in depth.

Electric Mining Hoist.

The engraving on this page and the one on page 92 represent an improved type double-reel electric mining hoist, manufactured by the Electrical Engineering Co. of this city. The moving parts are all mounted on cast-iron bed plate and are self-contained. The drums are 40 inches in diameter, with 24-inch face, having deep flanges to contain from 1500 to 2000 feet of three-fourths inch rope. Each drum is independent of the other, and may be thrown in or out while the gears are in motion, and each is provided with bronze bushings, which may be replaced in case of wear and new ones substituted therefor. It will be noted that on the end of the intermediate shaft there is a gypsy, to be used in loading timbers, or other heavy bodies into the skip or cage. The motor is of the latest bipolar commutated field type, where rheostat resistances are entirely dispensed with, whereby the greatest possible torque in starting at slow speed is obtained. The center lever controls the car speed, operating it at from 50 to 500 feet per minute, having seven different speeds in all, and being reversible.

DOUBLE REEL ELECTRIC MINING HOIST.

The Mineral Land Bill.

So far Congress has taken no action in regard to the Mineral Land Bill, and nothing can be done unless the Speaker consents to allow time for its consideration at this session. The Secretary of the Mineral Lands Committee of the California Miners' Association wrote last month to each member of Congress from all the mining States and Territories, and to his letter replies have been received from nearly all of them, expressing their desire not only to vote for the measure but to do all in their power toward securing its passage. More than that, those most familiar with the state of affairs say that they believe that there can be little doubt of its passage, if it is allowed to come to a vote. A number of energetic members from this and other States are doing all they can to bring this about. All depends upon their influence with the Speaker.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Double Reel Electric Mining Hoist, 89-92. A New Stadia Protractor; "Birch" Improved Two-Stamp Mill, 93. Improved Double Tooth Dog; Large Generator in Course of Construction, 96. Rubber Belts and Conveyors, 97.

EDITORIAL.—Protect the Mine Laborer and Supply Men; Deep Shaft Sinking; Electric Mining Hoist; The Mineral Land Bill, 89. Proposed Corporation Bills; Laws Framed by Miners; Foreign Capital; The Mining Bureau, 90.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 94-95.

SCIENTIFIC PROGRESS.—Roberts-Austen's Discovery; A Property of Compressed Air; Aluminum Cannot Be Used in Men-of-War Construction; Account of a Meteorite; The Use of Sand Blast, 96.

MECHANICAL PROGRESS.—Improved Double Tooth "Reliance" Dog, Made Entirely of Steel; Largest Generators for Lighting; Acoustical Properties of Aluminum, 96.

ELECTRICAL PROGRESS.—Electric Energy from Coal; Electric Traction in the Sewers of Paris; A New Light, 97.

PRACTICAL INFORMATION.—Oldest Iron Bridge; Mining at Great Depths; Gas Consumption in Gas Engines; Charter of the Bank of France; Influence of Fatigue upon the Nervous System, 97.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 106.

MISCELLANEOUS.—Concentrates, 91. The Solution and Precipitation of the Cyanide of Gold; The Charcoal Thread; The Drainage of American Flat, 92. "Birch" Improved Two-Stamp Mill; Suggestions for Stadia Surveying, 93. Rubber Belt Conveyors, 97. Coast Industrial Notes; Recently Declared Mining Dividends; Recent California Mining Incorporations; Personal, 98. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 103. Commercial Paragraphs; Temperature and Rainfall, 107.

Proposed Corporation Bills.

There have been introduced in the State Senate three bills which contain some features that will be of value and others that seem iniquitous. One of these, Senate Bill No. 322, is to amend sections 307 and 312 of the Civil Code of California as to the use of proxies in meetings of stockholders of corporations. It provides that no proxy shall be voted unless it be that of the actual bona fide owner of the shares, whether they shall at the time stand on the books of the corporation in the name of the actual owner or not, and declares that brokers or persons holding stock as security are not actual bona fide owners in the sense of the bill.

There has been some litigation as to the right of the latter class—persons holding stock as security—voting such shares. It would seem that, in this respect, a statute defining the rights in the premises should be passed. But this bill goes too far and provides that those in whose names shares are placed as trustees may not vote them through proxy. It practically takes away from the shareholder the right to delegate his authority to others.

Another bill amending the present law provides that monthly instead of weekly statements shall be made by the secretaries of all corporations for the stockholders, and that any stockholder shall be entitled to visit the property of the company with his expert and make full examinations.

A third bill amends sections 332 and 342 of the Civil Code. The new provisions as to section 332 are that no assessments may be levied by the board of directors without the concurrence of a majority of the stockholders at a meeting called by the board of directors for that purpose, and that no assessment shall be levied unless the board of directors has first made a report to the stockholders, under oath of the president and secretary, of the actual financial condition of the property and containing itemized statements of the expenditures of money derived from the last assessment. Such a law would do much toward securing better and more honest management on the part of directors.

But that part of the same bill amending section 342 of the Civil Code does not seem to promise to serve any good purposes. It provides that the owner of any stock sold to another at a delinquent sale for assessment may redeem it, at any time within six months, upon paying all costs and ten per cent additional. In the nature of things, the value of mining stocks are more variable than most other property, and the passage of such a bill would give an unfair advantage to the delinquent in many cases.

Laws Framed by Miners.

At a miners' meeting in Randsburg last week a new set of rules and regulations were prepared for adoption by the mining district. These should be worth the consideration of those interested in legislating for the miner. There was adopted in the earlier days of the camp a set of rules and regulations which were found to be unsatisfactory. As the Randsburg *Miner* says:

"It has been found that the present customs are somewhat faulty, and it is the desire of those who come to this camp to mine and work in good faith to be protected. As hundreds of claims are staked and monumented without the least sign of ledge matter or 'mineral in place,' a law or custom is desired to compel a certain amount of work to be done before a claim can be recorded. By this means it is hoped to balk the 'claim grabbers,' some of whom have as high as thirty claims each located, and who at the end of each thirty days put a new certificate of location on the claims and hold them at high figures, keeping out the men who would develop."

Now, in Randsburg district this miners' meeting was composed of men of experience in other mining camps of this State and of other States and Territories. It is safe to say that the meeting had the advantage of the advice of men who knew the faults and good points of nearly all the mining laws and district rules and regulations on the Pacific coast. They were earnest men, interested in the welfare of their camp and their own better protection. The circumstances are so similar to those of all other mining camps of this State, that rules as to locations which would be suitable for them would be suitable for any other district in California. The principal sections of these rules and regulations are as follows:

Every location of a mining claim made in said district shall contain: First, the name of the claim; second, the name of the locator or locators; third, the date of the location; fourth, the number of feet in length of said claim, and the number of feet claimed on each side of the center of discovery shaft lengthwise of the claim, and the number of feet claimed on each side of the discovery shaft crosswise of the claim; fifth, the general course of the lode or premises, as near as may be; sixth, the locality of the claim with reference to some natural object or permanent monument as will identify the claim.

SEC. 3. Before filing the location certificate with recorder of the district the discoverer shall locate his claim: First, by sinking a discovery shaft upon the premises so claimed to a depth of at least 10 feet from the lowest part of the rim of such shaft at the surface, and deeper, if necessary, until there is shown by such work a lode or deposit of mineral in place; second, by posting a notice at the point of discovery, on the surface, said notice so posted substantially conforming to the location certificate; third, by marking such claim or premises on the ground, so that the boundaries shall be marked by not less than seven substantial posts projecting not less than 3 feet above the ground, or by substantial stone monuments at least 3 feet high, to-wit., the initial or discovery monument or post, one at each corner of the claim, and one at each end center thereof.

SEC. 4. Any open crosscut, cut, adit, or tunnel which shall be made as above provided for as a part of the location of a mining claim, and which shall be equal in amount of work to a shaft 10 feet deep from the lowest part of the rim of such shaft at the surface and 4 feet wide and 6 feet long, and which shall cut a lode or body of mineral in place at the depth of 10 feet from the surface, shall be equivalent, as discovery work, to a shaft sunk from the surface, as hereinbefore mentioned.

SEC. 7. Within three (3) months after the expiration of the period of time for the performance of annual labor, or the making of improvements upon any mining claim or premises, the person on whose behalf such work or improvements were made, or some person for him knowing the facts, may make and record, in the office of the district recorder, an affidavit.

Then follows the form of the affidavit to be made.

Section 8 deals with the relocation of forfeited and abandoned claims, and provides that they shall only be made by sinking a new discovery shaft and fixing new boundary lines, the same as in making a new location, or the relocator may sink the original discovery shaft 10 feet deeper and erect new monuments, and shall state in the location certificate if the whole or any part of the relocation has been made on abandoned property.

These rules and regulations, it may be seen, are almost identical in their meaning to the similar sections of the bill proposed by the MINING AND SCIENTIFIC PRESS, published Oct. 31, 1896, and submitted for the consideration of the miners and the Legislature. A district such as Randsburg, with good rules and regulations, will not have the need for a general law for the State, of course, that will many other parts of the State, where there are no district rules and regulations in force. In a recent decision of the Supreme Court, in the case of Howeth v. Sullenger, in which it is said that where a claim is *not* in a mining district, any marking of the boundaries so that they can be readily traced, is sufficient; and stakes and stone monuments set at each corner of the claim and in the center of each end line, with one or more notices of location sufficient for identification of the claim, is a compliance with the statute. And the Supreme Court of Nevada holds that such marking is sufficient under the strongest construction of the Act of Congress. But the miner does not want to go to the court decisions to learn what should be done.

Foreign Capital.

It would hardly seem necessary to present to foreign capitalists any further argument in favor of investing in mines in the United States and British Columbia in preference to South Africa and Australia than that, while millions have within a few years past been poured into the gold fields of these two continents and very little has come this way, the output of gold has increased some 25 per cent in America within a year and has fallen off in Australia and barely held its own in Africa. This, it seems, is beginning to be appreciated, for there is a livelier interest taken now in London as to the mines of British Columbia than any other field.

It is often asked why British capital does not more eagerly seek investments in mines in the United States. Of course, one reason is that there are closer relations in business and otherwise between the British and the other gold fields, which are in their own colonies, or, as in the case of Africa, in condition to be controlled by them. But here the Briton must take the conditions as he finds them. However, probably the fact that the best gold miners in the world are here, the values of properties placed upon them by their owners are nearer their real worth, and there is far less opportunity for speculation, has much to do with deterring foreigners from comming here for mines.

However, of late the tendency of English investors in foreign mines has been to secure properties, not for speculative purposes, but rather as pure investments. It is this class of purchasers that will turn rather to America than to Australia. They are learning that better opportunities for paying investments are to be found in the older mining districts than in the new. They learn that too often the prices on mines in new districts are "boom" prices, and it is to be observed that of the investments made by foreign capital in America during the past year a large proportion has gone into old districts, and in the purchase of well-developed mines. It is, on the other hand, American capital that is developing the new mining districts.

The Mining Bureau.

It is time that some active steps were taken by the California Miners' Association and other representatives of that industry toward securing proper appropriation for the future maintenance of the State Mining Bureau. The miners have never asked for much legislation expensive to the taxpayers of the State—be it said to their credit—but what they have asked for has been of value not only to the mining industry, but to the whole commonwealth. The California Miners' Association, since its organization, has done much in securing legislation of value, but few of their bills have carried appropriations. The importance to California of mining will justify the Legislature in passing the small appropriation required without much question. No other industry has done more for the State's progress nor asked less aid.

Concentrates.

A LOT in Randsburg, Cal., has been sold to a woman for $1250.

MOLYBDENITE has lately been discovered in Utah, not far from Salt Lake.

THE new mining exchange in Spokane, Wash., held its first public call on Jan. 18th.

A TEN-STAMP mill will shortly be erected at the Shawmut mine, Tuolumne county, Cal.

A 500-HORSE POWER engine is to be erected at the De Lamar mine, Pioche county, Nevada.

THE shaft of the Congress mine in Arizona is now down 1700 feet and has been in pay all the way.

A COMPANY has been formed to work gold dredging machines on the Saskatchawan river, in Canada.

THE gold output of Esmeralda county, Nevada, for 1896 was $300,000, according to the *Territorial Enterprise*.

THE Colfax, Cal., *Sentinel* prints a list of 134 gold mines that receive merchandise and machinery at that point.

THE first big sale of the year at Cripple Creek was that of last week for $85,000 of the Mollie Belle to Eastern capitalists.

A GARDENER in Santa Barbara, Cal., claims that he has discovered the long lost Padres mine in the mountains of that county.

LARGE deposits of silver ore with gold have been discovered within a few miles of Chihuahua, Mexico, on the hacienda Tabuluoplo.

A BILL is going through the Idaho Legislature to prevent Idaho mine owners from running stores in connection with their mines.

IT is reported that the intention of the owners of the De Lamar mine in Nevada is to increase the daily capacity of the mill to 500 tons.

A. C. MASSEY has leased a tract of land on the Juristac ranch near Sargent's Station, Santa Clara county, with the intention of boring for oil.

THE Jerome *News* is authority for the statement that the net profits of the United Verde copper mines at Jerome, Arizona, for 1896, were $3,500,000.

EASTERN people are experimenting with the low-grade ores of Bingham, Utah, of which there are immense bodies, and which have so far defied profitable treatment.

CONSIDERABLE capital has lately gone into the Lake of the Woods district in Ontario, Canada, where there are now 145 stamps working and some 50 more are being put in.

AN experimental plant is being erected in Salt Lake, Utah, under orders of Charles Butters, for testing the Siemens-Halske cyanide process he represents on Utah ores.

THE Oroville *Mercury* claims that the miners of Butte county, California, produced $250,000 more in 1896 than in 1895, when, according to the mint estimate, it was $473,672.

THREE years ago some English capitalists obtained a group of gold mines at El Perral, Chihuahua, Mexico, and have developed 300,000 tons of ore. A smelter has been erected.

MANY miners in Mexico are going to the State of Sonora, on account of the increased activity there. The superintendent of the Poloma mine lately sent for 100 men for his property.

ON Texada Island, British Columbia, in the Van Anda mine, owned by Victoria and Chicago capitalists, it is claimed that the ore runs 60 to 70 per cent in copper, besides carrying gold.

THE proceedings of the fifth annual convention of the California Miners' Convention have been printed in pamphlet form for distribution among the members by Secretary Julian Sonntag.

PROPOSITIONS for running the branch tunnel to American Flat have been made to the Comstock Tunnel Company, and many of the influential mining men are actively advocating the scheme.

THE Colorado State Bureau of Mines has issued an order "prohibiting the continued use of iron or steel tamping bars in mines in that State for the purpose of driving powder into drilled holes."

AFTER the 1st of July, 1897, any blank card of proper size may be mailed by attaching a one-cent stamp, and will answer the purpose of the present official postal card as a medium of correspondence.

IN answer to a subscriber regarding the statement as to "the deepest bore-hole in the world," the exact depth of the one at Paruschowitz, Upper Silesia, is 6,572.71 feet from the surface of the soil.

THE Exploration Company of London, since it purchased control of the Helena & Frisco mine in Idaho, has been negotiating for control of several other big silver-lead mines in the Cœur d'Alene district.

THE Pueblo, Colorado, smelter made a shipment last week of eighteen car loads of lead to Liverpool, England, via Galveston. The ores from which the lead was smelted came from British Columbia in bond.

DURING last month the Alaska-Treadwell mine milled 13,736 tons ore and treated 416 tons sulphurets. The bullion yield was $43,096, of which $17,338 was from sulphurets; average yield of ore, $3.14 per ton.

A WOMAN is a candidate for the position of Mining Recorder of the Georgetown district in El Dorado county, Cal. The election is to be held in a corner saloon, and, if successful, she will choose other headquarters.

DURING '96 the Argentine mines, South America, yielded, silver, 1,042,492 pounds; gold, 22,462 pounds, and of copper, 857,780 pounds, most of which was shipped to France, Germany, England, Belgium and Italy.

AT Kamloops, British Columbia, to the north of Coal hill, in which the copper-gold ores exist, has been discovered asbestos, but the deposits have not as yet been sufficiently developed to determine their extent and value.

THE topographical survey of the Tintic district, Utah, by the United States Geological Survey, is being made on a scale of 800 feet to an inch, with contour intervals of 20 feet, the map covering an area of twelve square miles.

THE Exploration Company of London, which lately purchased the Tomboy at Telluride, Colorado, is preparing extensive operations and will expend $300,000 in improvements. As soon as possible the output of the mine will be doubled.

THE Burcham group of mines in Randsburg, Cal., has been taken over by a corporation formed under the laws of Colorado with a capital of $1,500,000, with shares at $1 each, par, and non-assessable. The company proposes to erect a mill and bring water in from Cuddaback lake, where it will bore wells.

THE site of the new town of Stent, in Tuolumne county, Cal., is situated on a quartz claim located in 1894 and on which the necessary assessment work has been done since, but which was not known of when the town was built up.

ASSEMBLYMAN POWER of Placer introduced in the Legislature last Wednesday the bill proposed by the California Miners' Association, supplementing the Federal Statutes as to locating mining claims and perfecting titles to them.

THE Mountain Copper Company of Shasta, Cal., is arranging to add to its possessions the Balla Klallala or Windy Camp mines to the Iron Mountain group. This, if carried out, will cause the building of another railroad six miles in length.

A TELEGRAM from Tacoma, Wash., states that Alaska and Puget Sound merchants and the steamship companies are preparing for an influx of 10,000 to 15,000 miners into Alaska this spring. Last year about 5000 men went north to the mines.

IN the California Legislature the Committee on Mines and Mining has agreed to report favorably on the bill requiring mining corporations to post a monthly statement of receipts and expenditures, instead of a weekly statement, as heretofore.

REPRESENTATIVES of the Mountain Copper Company, Shasta, Cal., are purchasing low-grade ores to be used for flux in the furnaces at the smelter at Keswick, and several owners of ledges carrying low-grade ores have resumed operations upon their properties.

DURING 1896 the Mercur mine in Utah, according to the manager's report, handled 63,480 tons of ore and paid in dividends $225,000. The cost of mining the ore was $1.92 per ton and of milling 86 cents per ton. The ore yielded an average of $12.33 per ton.

THE Executive Committee of the California Miners' Association last Monday appointed the following a committee to take steps toward securing an appropriation from the Legislature for the Mining Bureau: S. J. Hendy, Mark B. Kerr and Samuel K. Thornton.

THE Lizalda mine, on Table mountain, in Mexico, just over the line between California and that country, has been purchased by Maston & Scott, who are negotiating for the purchase of the Sueno, and, if successful, say that they will erect a smelter at San Diego.

DURING '96 the Tacoma, Wash., smelter produced 22,584 ounces of gold, 438,504 ounces of silver, 5,012,000 pounds of lead, and 223,026 pounds of copper, of the total value of $921,994. During the same period the Everett, Wash., smelter produced in gold, silver, copper and lead $1,255,000.

ROSSLAND, B. C., a year ago had a population of less than 400, while the present number of inhabitants is estimated at 6000. Not long ago a Canadian syndicate bought several hundred lots on speculation. A better indication of the future prospects of the place could not be asked.

ASSEMBLYMAN EMMONS has introduced in the Legislature a bill limiting to seven the number of mining claims to be made by any one person or corporation or association in any one district in any one year, and to fourteen claims in one year in a county embracing more than one mining district.

WASHINGTON is in much the same position as California as to laws in regard to location of mines and there is a movement on foot there to induce the Legislature to pass laws supplementing the Federal statutes such as have been proposed in this State by the MINING AND SCIENTIFIC PRESS.

IT is being strongly contended in British Columbia that mining machinery from the United States should be admitted free of duty. It is claimed that this would cheapen the cost of working ores and result in building new smelters and mills on the ground, and consequently keep much money at home.

EVERY miner should learn to sharpen tools. It is impracticable in small mines to employ a man exclusively for this work, and it is generally impossible to take them to a blacksmith shop. Many a miner seeking work would be much more quickly employed if he could do this, and it can be learned very easily.

AT a recent meeting of the Victoria, B. C., Board of Trade a resolution was passed recommending the passage of a bill shutting out of the province all companies organized under the laws of a foreign country and imposing large fees and duties upon companies organized under the provincial or dominion acts.

A DEPOSIT of graphite, lately discovered in Ontario, promises to be one of the largest in the world. There are several deposits in California, but the quality has not been shown to be good. The demand for graphite is such that there is a constant search for new sources of supply on the part of the manufacturers who use the article.

THE Committee on Mines and Mining will probably report favorably on Assemblyman Robinson's bill, requiring mining companies working under a bond or trust to file with the County Recorder a bond of $5000 as security for the payment of laborers and materials which may be used in the development and working of those bonded mining claims.

A PETITION is being circulated, which finds many signatures, asking for the passage of a law similar to those in force in Colorado, Montana and Idaho, in which States the locator of a claim is required to do not less than ten feet of work and to find at least one wall before recording. This will prevent the practice of one prospector locating the entire country with no intention of developing his properties.

EX-GOVERNOR WEST of Utah lately accompanied some special agents of the Treasury to Rossland, B. C., as an ore expert. He says that the sampling works will be re-established at Northport when the new administration goes into power. Secretary Carlisle has refused so far to expend the money appropriated for this purpose. As it is now, the Government must accept the assays of the smelting companies.

AT Aspen, Colorado, the Cowenhagen Tunnel Company has transferred its property to a new corporation, which is formed to build a line of railway through Smuggler mountain to the town of Lenado, and thence to the Denver & Rio Grande railway. In order to carry out the railway scheme, it was necessary to use the tunnel, which will probably be the first used for a regular railway and mining and draining mines combined.

A RECENT agitation as to whether lands once deeded to the State for school purposes would revert to the Government after they were found to be mineral-bearing, led last week to a stampede to locate the school sections of the Cripple Creek district. Prospectors swarmed over the sections, setting stakes upon the State lands, and at night guards were mounted to protect the new stakes against parties holding leases from the State School Land Board.

JOHN HEIMRICH and other Salt Lake capitalists are having examinations made in the new Grand Encampment mining district in southern Wyoming. Over a very large part of the country surrounding are extensive deposits of auriferous gravel, generally shallow and of lacustrine formation. The gravel is mainly a quartz sand, carrying gold so fine that in cases it takes over 1000 nuggets to make one cent. However, it is not flaky, and may be saved in sluices.

CITING the fact that the Arkansas Valley smelter at Leadville, Colo., treated more ore by 27,000 tons in '96 than in '95, even though the great strike was on, the Pueblo, Colorado, *Chieftain* declares that the smelting business "is the best industry in the United States to-day." Still, a good many are of the idea that a paying gold mine is better, that being the only business from which is eliminated the troublesome factors of freight charges, competition and securing of sales.

THE Boston and Montana Copper Company produced from its Montana mines nearly 60,000,000 pounds of copper in 1896. The net earnings should show over $2,600,000, after all interest charges and sinking funds have been allowed. The company has spent during 1896 some $300,000 to $400,000 for permanent improvements. The management has reduced still further the cost of production, and can deliver copper in New York at a cost of 5 cents per pound, which should show a net profit of over $300,000 per month.

THE debris question is coming up in British Columbia. On the lower Fraser river there has been some agitation about running gravel in the river and filling the mouth with debris. However, although the conditions are similar, there are many who believe, as they did in California, that a very small proportion of the damage is due to hydraulic mining. The silt has been coming down for ages and has caused the formation of the great fertile basins of the lower Frazer. A case is mentioned by the *Mining Record* of a large slide from which more debris has come into the river than will be washed from the Cariboo mine in twenty years.

THE fight between the tunnel owners and mine owners is coming on apace at Cripple Creek. George B. Mechem has raised the court's ante and wants to take the whole of Gold hill with his Chicago and Cripple Creek tunnel. The Judges of the United States Circuit Court at St. Louis gave the Newman tunnel 1,500 feet on the Rico-Aspen vein by right of its location prior to the discovery of the ore at the surface. Mechem has found a presumably blind vein in his tunnel at Cripple Creek and located 7,500 feet of all kinds of veins on Gold hill because of it. The mining law gives the discoverer of a vein 1,500 feet upon it by virtue of his discovery hole and location. Mechem has located five claims on one discovery hole.

A BILL introduced in the California Legislature by Mr. Soward of Sierra has passed the Assembly and provides that owners of mining claims shall have precedence over all others in the purchase of town lots from the public domain. The bill as finally passed provides that if at any time within six months of the filing of a plat of a townsite with the County Recorder there shall remain unsurveyed into town lots any portion thereof, any person who shall discover gold in any portion of such unsurveyed portions shall by application to a Superior Judge be given the right of preferred purchasers upon the payment of an amount sufficient to survey such mineral claim. After such survey is made the preferred purchaser is entitled to a deed upon the payment of an amount equal to $1.25 per acre or fraction thereof.

THAT "time is money" is acknowledged on all sides, but seldom has it been more glowingly exemplified than in the more or less truthful telegram from Denver that H. E. Brown had been awarded $5,500,000 by the Court of Pretoria, South Africa, for one hour of his time. According to the telegram, some time in '96, the Transvaal Government announced that certain South African mineral land would be thrown open to locators, that he intended to so locate and was ready at the advertised time, but the proclamation was withdrawn, whereupon he began proceedings against the Government because of such action on its part, which is now alleged to have resulted in a verdict against the South African Republic for the amount stated. It is probable, however, that some ciphers may be dropped from the announced figures without detriment to the truth.

IT is proposed to advocate the passage of an act by the Legislature placing an export duty on ores from British Columbia. This action would mean practical prohibition of the smelting of British Columbia ore in Washington or any other American State. This, and several other measures looking toward prevention of commercial relations between the mining districts of Western Canada and the United States, have been proposed, not by the miners themselves, but by people who expect to gain indirectly. It is suggested by the miners that machinery be admitted free from the United States. Altogether many suggestions somewhat radical in their nature have been proposed for the consideration of the Legislature. But whether the present movements looking toward building a Chinese wall passes or not, it must be said that the present liberal laws and customs of the colony of the North have done much toward building up the mining interests of British Columbia.

THE Southern Pacific Company advertises through its general land agent, Wm. H. Mills, in the Siskiyou county papers, that to all persons having an actual, operated mine upon any odd numbered section of land within the limits of the grant to the California & Oregon Railroad Company, the land actually within the mining claim will be relinquished if the land is not patented, and will be donated if the land is patented. Persons wishing to prospect patented railroad land can enter into contract with the land agent, which will make the discovery of mineral upon land safe to the prospector. All lands which may reasonably be classified as mineral will be held for encouragement of mining, and mining operations will be given the preference of occupancy and use, unless such land possesses a value for the timber growing thereon. In such cases a timber value only will be assessed against the land and the land held for the encouragement of mining; or, if patented, will be sold at the minimum of $1.25 per acre, reserving the timber right. In conclusion, Mr. Mills says: "In the disposition of its land the Central Pacific Railroad Company will pursue the policy of encouraging the discovery of minerals and the prosecution of mining enterprises, and in no case will its title obstruct or discourage such enterprise."

The Solution and Precipitation of the Cyanide of Gold.*

NUMBER VII.

By S. B. CHRISTY, Professor of Mining and Metallurgy, University of California, Berkeley, Cal.

8. Recovery of Cyanide of Potassium from Strong Solutions by Zinc Sulphate.

As objection will be made to the cuprous method of gold precipitation when strong solutions of potassium cyanide must be used, it is necessary to consider the recovery of the cyanide from such solutions previous to the precipitation of the gold.

A careful study of the ferrous sulphate method of recovering the cyanide from strong solutions, previous to the recovery of the gold, by means of copper solutions, as suggested by Prof. de Wilde, has led me to regard it as entirely impracticable in most cases that occur in practice. I have, therefore, sought another method besides the one already set forth (by means of sulphuric acid and aeration). This I have found in the use of sulphate of zinc. I find, however, that an American patent had already been granted, October 15, 1895, to Bertram Haut of Wickenburg, Ariz., for such a method of recovery. According to the patent claim, he "precipitates the cyanide in the waste or spent liquor by adding a solution of sulphate of zinc containing some free sulphuric acid, whereby a cyanide precipitate is obtained; then drawing off the supernatent liquor; then mixing with the said precipitate a quantity of sulphuric acid more than sufficient to decompose the cyanide of zinc contained in said precipitate, then subjecting the mixture to a distilling operation."

The following statements are founded on my experiments made with a solution containing 1 per cent of free KCy and 0.1 per cent, or $603, gold per ton. When a chemical excess of sulphate of zinc is added to such a cyanide of potassium solution a white precipitate of cyanide of zinc forms, which readily settles, and may be decanted or filtered. [If alkaline sulphides are present, they may be first removed by treating the solution by means of lead sulphate.] If less than an excess of zinc sulphate is added, the precipitate separates very imperfectly from the solution and is difficult either to decant or filter. When the zinc sulphate contains a little free sulphuric acid very little gold comes down with the zinc cyanide, and when an excess of the zinc sulphate is used the precipitate separates in a manner leaving very little to be desired.

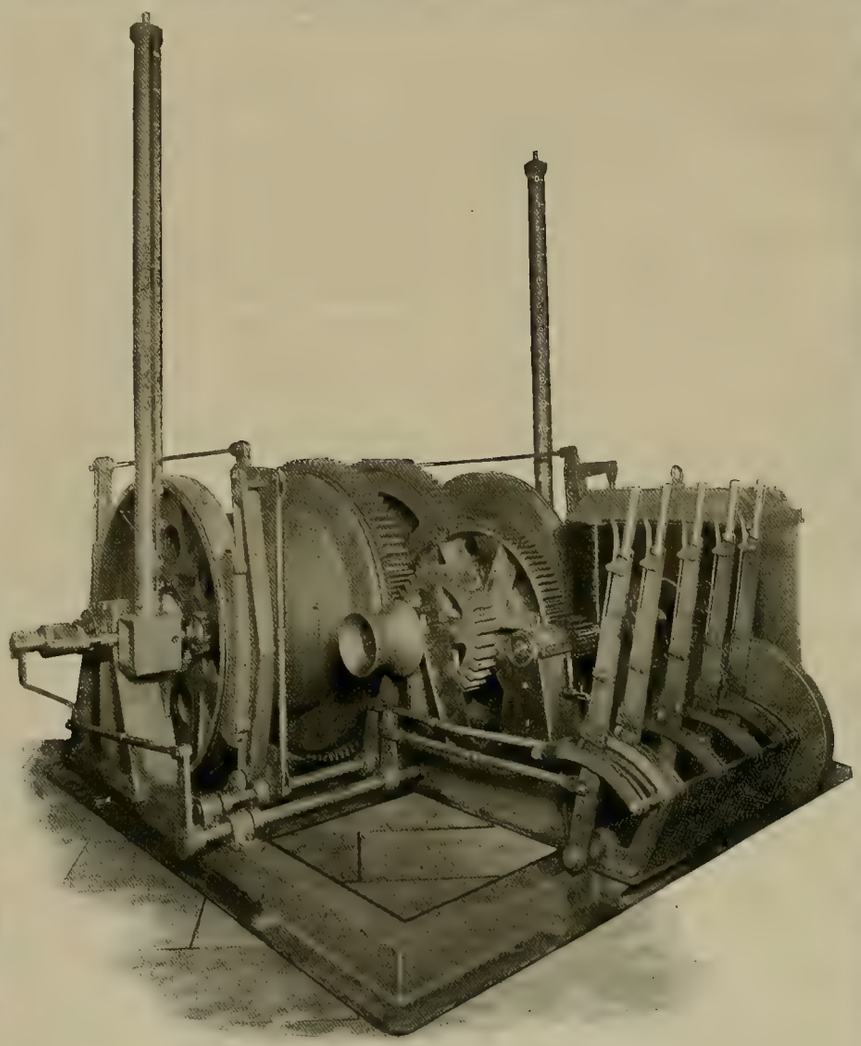
When the cyanide of zinc is acidified with sulphuric acid, and treated either, as I have already described, by pumping air through it, or distilling it, the cyanhydric acid may be very completely recovered by collecting it with caustic potash. The latter may be entirely saturated without loss by using two vessels for condensation, the first receiving the saturated and the second a weaker solution.

A certain amount of gold will usually be found in the zinc sulphate solution (as $HAuCy_2$). After crystallizing out the zinc sulphate to be used over again, the gold may be recovered from the mother liquor by precipitation with sulphurous acid and copper sulphate, as before described. The amount of gold that comes down at this point seems to depend on the amount of free acid contained in the zinc sulphate. Sometimes only traces come down; sometimes nearly half of that originally present in solution.

From the filtrate from the zinc cyanide precipitate the gold may be recovered by sulphurous acid and copper sulphate, or cuprous chloride direct, as already described.

This method of treating stronger solutions, such as 1 per cent, as would be used in treating rich gold ores, leaves very little to be desired, working on a laboratory scale. It is in every way superior to that described by Prof. de Wilde, with sulphate of iron. Still, it may be questioned whether such a method could be carried out in a mining camp. There is one serious difficulty that it would meet. When the ore solution contains ferrocyanide of potassium, as it is likely to do, a ferrocyanide of zinc forms, which is of the consistency of white lard. This substance is hard to settle, and practically impossible to filter. It is insoluble in acids, but easily soluble in alkalies or potassium cyanide. In the presence of this substance, the simple acidification of the solution, followed by the removal of the HCy, by circulating air through it and condensing in caustic potash, would probably be a more successful method of recovering the cyanide.

9. Precipitation of Aurous Cyanide by Means of Zinc Chloride.



An American patent has been taken out on this method by Frederick Rinder, June 18, 1895. In this method "the solution containing gold and silver in solution is first treated by iron sulphide, whereby the silver is removed as a sulphide; chloride of zinc is then added to the filtrate, whereby the gold is precipitated as a double cyanide of zinc and gold."

I have also investigated this method. When chloride of zinc was made by boiling an excess of metallic zinc in hydrochloric acid till the action ceased, and the solution was added to one of potassium aurocyanide, nothing more than a trace of gold was precipitated. But when the chloride was formed by treating oxide of zinc with hydrochloric acid, the former in excess, so that one had in reality to do with a solution of oxychloride of zinc, 99.37 per cent of the gold present was precipitated. It should be mentioned that both solutions of chloride of zinc had a slightly acid reaction to litmus paper.

As, however, an excess of either acid or alkali dissolves the gold precipitate, this method must remain inferior to the method of precipitation as cuprous aurocyanide; for this precipitate seems almost absolutely insoluble in dilute sulphuric acid. The latter, therefore, possesses a sharpness and completeness that the zinc method can never have.

(To be Continued.)

*Colorado meeting American Institute of Mining Engineers, Sept., 1896. (Revised Proofs Dec. '96.)

DOUBLE REEL ELECTRIC MINING HOIST. (See page 89.)

THE charcoal thread used as filaments in incandescent electric lamps costs $12,000 a pound. The following is a list of the rarer metals, with their approximate prices per pound, based on the usual reduction on such quantities:

Gallium	$100,000
Beryllium and lanthanum	10,000
Rhodium and thorium	6,000
Didynium and rubidium	4,000
Indium and tantalum	3,500
Erbium, niobium and yttrium	3,000
Rhutenium and vanadium	2,000

The most expensive organic substance known is ambergris, which is worth about $600 per pound.

The Drainage of American Flat.

Written for the MINING AND SCIENTIFIC PRESS by DAN DE QUILLE.

The draining of American flat and the working of the mines situated therein is at present being seriously considered by the mining men of Virginia City and Gold Hill. The large basin-like depression known as American flat lies immediately south of the most southerly of the Gold Hill mines. It covers several hundred acres and is surrounded on all sides with hills more or less rugged. There are known to be many quartz lodes in this large basin and it has always been thought that a main branch of the Comstock lode passes through it, though not showing on the surface. It was early seen that if the Comstock kept to the range on the east side of which it is situated, and swung in and out of the curves of the hills to the northward, as at Virginia City, it must run through American flat; therefore locations were made in that section by parties who came over from California in the first rush in the spring of 1860. The usual prospect holes—round, untimbered shafts—were sunk in numerous places, and on these holdings work was done until the wonderful richness of the mines in Virginia City and Gold Hill caused a boom that enlisted all the loose capital on the Pacific coast in mining enterprises on and along the Comstock range.

When the boom came and excited men of means were wild to find a place in which to put their money, the owners of claims in American flat had no trouble in getting all the capital required for the erection of hoisting works and the purchase of first-class machinery. The big flat was then considered the most promising section off the main Comstock lode and was the scene of great activity. At this time there was quite a lively little town at the flat, called American City, a 'bus line to Virginia City and crowds of passengers daily to and fro.

But soon adverse circumstances changed the roseate hue of the American flat atmosphere to a cerulean tint. Floods of water began to be encountered, and so strong was the flow that at a depth of 500 or 600 feet nearly all were drowned out of their mines. However, a few of the stronger companies still maintained the fight. They put in more and more powerful pumping machinery and managed to sink their shafts to depths varying from 800 to 1200 feet, and one company, the Baltimore, on the edge of the flat, attained a depth of 1400 feet by a hard struggle and by stopping out some of the surface water. None of them, however, was able to do much prospecting work at points below the 600 level, and, finding at last that to handle the flow of water was like trying to drain a lake, all "threw up the sponge;" the machinery was sold, the works pulled down and the camp deserted, every company being flooded out. So these mines have ever since stood.

As the water could not be handled by pumping, nothing remained to be done but to pull up stakes and abandon the mines. Owing to the configuration of the ground below the basin, down along the course of American ravine—its outlet—it was useless to think of running a drain tunnel. To have drained the basin of the flat would have required the running of a tunnel from a point somewhere on Gold canyon between Silver City and Dayton.

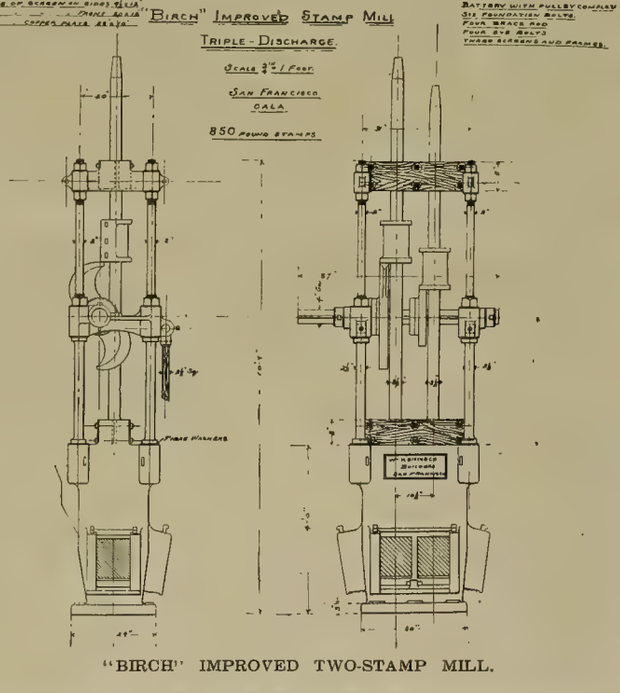
What is now proposed is to extend the Sutro drain tunnel to American flat, either from the Crown Point mine or the Alta, lower Gold Hill. One of the principal mines in American flat is the Rock Island. To reach this mine from the Crown Point would call for an extension of the Sutro tunnel a distance of 8634 feet; to reach the same point from the Alta an extension of 7500 feet in length would be required. As the starting point would be at a depth of about 1400 feet below the level of the surface, the extension would tap the American flat mines at as great a depth as would a tunnel started five miles east, down by the Carson.

American flat was doubtless at one time the basin of a lake. It has a dip to the east and at the lower end there is an outlet in the shape of a big spring. The greater part of the water in the flat is probably of surface origin. It fills the basin and extends downward to a depth of 500 to 600 feet. The pro-

posed tunnel extension would come in at a much greater depth; therefore, the whole basin would be drained. Below this surface water which comes from the "scalp" of the country no more water is likely to be encountered than anywhere else along the Comstock; therefore, mining operations may be carried down far below the level of the tunnel.

In case the extension is run it will most likely be from the Alta mine. That route would cut across the stratification of the country and would be likely to find deposits of ore now unknown; besides, it is the shorter way to the flooded mines. Superintendent W. E. Sharon of leading Gold Hill mines, Colonel Boyle, superintendent of the Alta, and many other mining men and experts favor the running of the drain extension, while all business men on the Comstock wish to see such an enterprise started.

The leading mines of American flat are the Baltimore, Knickerbocker and Rock Island, with about fifty other mines and locations of more or less value, but lacking development at depth. Ore assaying as high as $80 and $100 was found in the Rock of Island, and it may be had in great quantities, as the vein is immensely wide—over 400 feet. The vein below the water level—about 600 feet—contains a great deal of iron in the shape of pyrites and seems to be inclined to run to gold. The water from the mine deposits a kind of material almost as hard as iron. This soon lines the bottom and sides of a flume to the thickness of 2 or 3 inches, thus building up a stone flume within a wooden one. The predominating metal in the Baltimore and Knickerbocker is silver, and in both were found ores running from $25 to $200 and $300 a ton. Owing to the floods of water encountered little could be done in the way of developing the streaks and bunches of ore cut into.



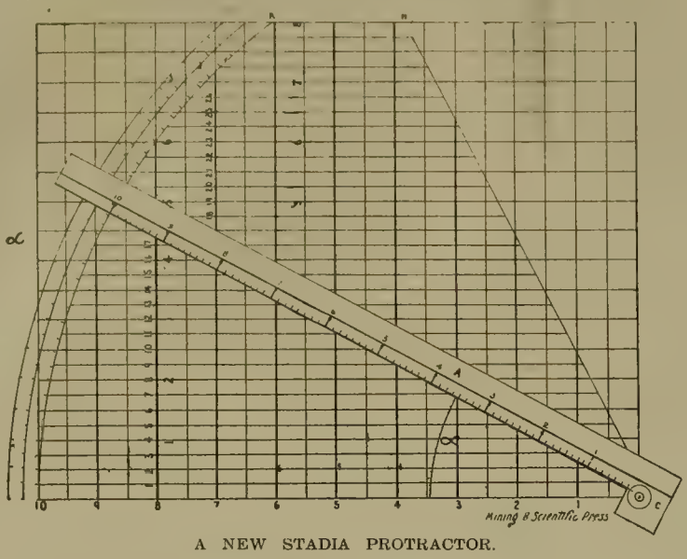
Besides the known lodes in American flat, it has always been thought that an unknown main branch of the Comstock passes through it, though not showing on the surface. Clarence King was evidently of the opinion that the main lode runs through the flat. He says: "In Seven Mile canyon, near the base of Cedar hill, is the most northern known portion of the Comstock lode. From that point it continues south in a nearly direct line, underneath Virginia City, across the divide, past Gold Hill to American flat, where the wide depressed area has produced conditions unfavorable to further development." The "unfavorable" feature he referred to was lack of drainage. From Cedar hill along the course of the lode the distance to the flat is about 22,000 feet.

Supposing the proposed drain tunnel to free the mines of American flat to the depth of no more than 1000 feet, it would still be worth while to run it. Between the surface of the earth and a depth of 1000 feet there are great possibilities. Between the surface and the 1000-foot level of the Comstock twelve bodies of ore were found and worked out, yielding 3,520,309 tons of ore of an average value of $29.65 a ton and producing $103,425,074 in bullion. The net profit in working these upper bonanzas was $22,813,280, which sum was returned to the stockholders in dividends.

(*To be Continued.*)

"Birch" Improved Two-Stamp Mill.

The cut represents a two-stamp, triple discharge mill, for gold or silver ores, made by Wm. H. Birch & Co., 129–135 First St., S. F., based on the principle of crushing a large quantity of ore economically, in the shortest space of time, with the least amount of power. The weights of stamps are 850 lbs. each, and the number of drops, 110 per minute. The weight of mortar is 2400 lbs.; screen discharge, three sides; area, 468 square inches. The shoes and dies are of forged steel. The steel cam shaft is long enough so that another mill can be added by coupling on, in order that in process of opening and developing a prospective mine an additional two-stamp mill can be added. The steel columns which support cam shaft are forged and securely keyed to mortar with fiber washers to prevent jar. The brace rods with turn-buckels to support mill are furnished. The stem guides are of oak. Stamp heads steel banded. Cam hubs steel banded. Cams have two steel keys each.



"BIRCH" IMPROVED TWO-STAMP MILL.

Suggestions for Stadia Surveying.

Written for the MINING AND SCIENTIFIC PRESS by M. A. KNAPP.

As the topography of a mining claim is often a very important point in determining its value as well as the best method of working the vein; so is it important that a map of mining ground should show those topographic features by contours, etc., as well as define the boundaries of the claims.

The notes for this data will generally be taken by the engineer by use of transit and stadia rod while making the survey of the claim lines; as plane table surveys require too much time in the field. Also, it is generally necessary to have the boundaries and monuments of the claim carefully plotted before making the contour maps, as the stadia notes are tied to the claim corners and other monuments located by more careful survey.

A NEW STADIA PROTRACTOR.

To plot these stadia notes, giving position and elevation of all points sighted to, stadia tables may be used, reducing the field readings to horizontal and vertical distances. To save time, however, two ruled paper scales may be procured on which stadia equivalents for the distances and vertical angles read in the field may be found by following the proper degree and 10-foot lines to their intersection and interpolating for the minute of angle and unit figures of the distance.

A New Stadia Protractor.—The writer uses for this work a paper scale which can be read much more rapidly and fully as accurately as these intersection scales, and thinking it might be of use to fellow mining engineers, directions for making one are here given. The work can be done in a day's time by a good draughtsman. The accompanying sketch explains itself: Scale *A* is made of folded cross-section paper and marked to 1000 feet. The center at *C* is made by fastening a small metal-foil star to a circle of cardboard and punching a pinhole through. Glue to paper exactly on center *C*. A similar center is fastened on the sheet below. When in use drive a pin through the centers into the draughting table beneath. The sheet of cross-section paper, 20x16 inches, should be of the same print as the one from which the scale was cut. Arc No. 1 of 20-inch radius is marked to degrees and half-degrees so that cosine ∞ = cosine square of the angle as marked on the scale. With this arc is used a horizontal scale on the cross-section lines in which 1000=20 inches. This is marked by horizontal rows of figures every inch vertically; the hundreds and tens marked and lines overruled; interpolating in reading for units.

On arc 3 mark degrees and quarter-degrees so that ¼-sine ∞ = sine × cosine of the degree of the angle marked on the scale. This is multiplied by 4 in order to attain greater accuracy in reading vertical distances. With this there is a vertical scale carried through the paper in which 1 inch = 20 feet, marked to 2 feet, and interpolated to ½ foot. Figures should be in vertical rows every inch horizontally, and horizontal lines overruled every ½ inch.

No. 2 arc is marked in true degrees and 10-minute angles, and a vertical scale equal to the horizontal one is marked on the sheet to correspond with this arc.

These three sets of scales should be in three different colored inks. The functions cosine square and sine × cosine are taken from stadia tables.

If now we have a stadia reading 510 feet at vertical angle—11½°—set the scale to the angle 11½° on the No. 1 arc and the 510-foot point on the scale *A* reads the corrected horizontal distance on the horizontal scale on the sheet. Then set the scale *A* on the 11½° angle on No. 3 arc, and the 510-foot point marks the true vertical distance on the vertical scale.

These readings are mentally corrected by the small correction due to the focal length of the transit. No. 2 scale is used to reduce check readings taken at high angles by causing the rodman to move the rod slowly back and forth in a vertical plane which passes through the instrument, the engineer taking the largest stadia reading on the rod. This is of course reduced to true distance by the direct angle.

Two or three stadia readings can be reduced per minute by the use of this scale, and it is so simple in construction that no large mistakes of reading are liable to occur. The errors of reading are very slight, being about one-tenth to one-quarter the errors of the reading of the transit notes. It is useless to reduce the office errors very far below those of the field.

With the use of such a quick-reading scale, stadia notes can be very readily reduced, and the contour lines and general topographical features of a mining claim quickly and closely plotted, giving a surface map that will always be of value to the mine management in connection with the later surveys of underground work, as well as of special assistance in locating ditch and road lines, etc.

A more durable scale than the one above described is made of a 2-inch strip of cardboard, 22 inches long. A strip of white paper is glued to the under side and on the ½-inch projecting edge the 1000-foot scale= 20 inches, is marked. This must be accurately marked throughout to correspond with the cross-section paper.

Telemeter-Stadia Rod.—It is unfortunate that the stadia rod, while giving results quite close enough for topographical notes, cannot be relied upon for measuring claim lines; as the errors, under unfavorable circumstances, may be as great as ½ per cent or more. The writer wishes to suggest a simple and fairly accurate method of measuring distances on rough ground by a development of the telemeter method:

Make a stadia rod 11 feet long, with targets at ½-foot and 10½ feet, accurately set and firmly fixed in place on the rod. At 5½ feet on the back of the rod fasten the top of a light compass ball and socket tripod, fixed so that the tripod can be folded back of the rod, or extended and set over a point, so as to hold the rod horizontally with the face to the instrument. A level should be attached to the side of the rod and a small cross-sight fixed on center, so that the rodman can sight back to the instrument.

This rod can be used as the ordinary stadia rod; and on all measurements of claim lines, or stadia turning points, can be set over the point and used as a telemeter. In this case we have a 10-foot perpendicular base line; and by taking ten or more multiple readings of this small angle, and averaging the error, it is possible to get it with great accuracy.

A table of functions of one-half of these small angles, to the second, could then be used and the true slope distance read; corrected afterward for vertical angle. A screw thread might be used on the vernier of the upper plate, which would give the reading of distance directly when a 10-foot base line was used. This would obviate the necessity of use of a table except to reduce the slope reading to horizontal and vertical distances.

The chief advantage of the method is in the fact that in cases where great accuracy is required, time may be taken to repeat the multiple readings a number of times, and reduce the error to less than that of the most careful chaining. The expense of surface mining surveys would be greatly reduced by use of this method.

Oakland, Cal., Jan. 23, '97.

Mining Summary.

CALIFORNIA.

Amador.

(Special Correspondence).—At Pine Grove a promising ledge of gold-bearing quartz has been reached on the claim of Thomas Day & Son, on Grass Valley creek, by a tunnel 200 feet in length.

In the Reward mine, on Grass Valley creek, a new tunnel to crosscut a very wide ledge has been begun.

A good strike of rich rock is reported from the Wieland mine.

The 10-stamp mill of the Azalea Company started last week and thus far operates quite satisfactorily. Some good rock is being taken from the old Dane ledge by the Azalea Co.

It is reported that a 20-stamp mill will soon be completed on the Robinson mine near Volcano.

Pine Grove, Jan. 23, '97.

Republican: It is expected that the Argonaut, Bellwether and Anita mining companies will each erect a mill during the present year of no fewer than forty stamps for each mine, and possibly this number may be increased to sixty.

Record: The Union Consolidated is taking out rich ore from the Union ledge on the east and west level. The breast is from 14 to 20 feet wide. The incline is going down at the rate of 30 to 40 feet per month with machine drills, having reached a depth of 480 feet, and when the 500 point is reached drifting on the Union ledge will go ahead and a crosscut pushed to the Gouge ledge.

Superintendent Dillon of the Dennis Kelly mine, in Pioneer district, has completed a deal for the purchase of the Robinson mine, near Volcano, and will have charge of it for the buyers.

At the Black Prince mine, in the shaft being sunk, they already have a good-sized vein of $6 to $7 ore. Hoisting machinery is to be erected at once.

Assays of ore from the 1050 and 1200 levels of the South Eureka mine shows a yield of from $30 to $138 per ton.

Ledger: J. F. Rooney, who is operating the McMahon property, has had buildings erected and will erect a steel whim. The shaft is down 100 feet and crosscutting to the ledge will be commenced.

The mill test recently made on the Good Hope mine was very satisfactory, and sinking will be resumed as soon as material can be gotten on the ground.

Calaveras.

Chronicle: At the Hexter mine the tunnel has reached a distance of nearly 1500 feet, and is being driven ahead as fast as possible.

Citizen: Kilburn and Coleman, mining men of Seattle are negotiating for John Howard's Poverty quartz mine in Salt Spring valley.

Frank Baumhogger of Angels is developing the Great Western. A good vein of ore is in sight which increases both in width and character as development increases.

The Carley brothers have resumed operations on their mines at French Gulch and are running the 5-stamp mill.

Some rich rock has been discovered in the Tryon mine, south of Angels.

El Dorado.

(Special Correspondence).—O. W. Frost and others, who recently purchased the Skinner mine, one-half mile from town, have incorporated. They are driving a tunnel into the famous old hill that has yielded many thousand dollars from its surface seams and pockets. The property will be known as the Empress Josephine mine.

F. B. Lloyd has completed a steam power plant on the property recently purchased from Noyes and French, by which he will drive machine drills on the tunnel work.

The Omo mine, twenty-five miles southeast of Placerville, started a 5-stamp mill last week.

Mulky and Spreckels, in the Fairplay district, twenty-seven miles east of here, have started their hydraulic plant working day and night.

D. H. Jackson and son are running tunnel and shaft work on the Lone Star and Secora properties, four miles southwest of town.

The Vavozza brothers have reached 1600 feet in their tunnel, three miles east of town. They expect to reach the channel within 200 additional feet of work. They have 400 acres in the property on which they are operating.

Col. Cummings is operating a core drill on the old Texas Hill gravel property, two and one-half miles south of town. Rooney and Fair are interested in the work.

The Selby Mining Company will sink a shaft 200 feet on the property recently bonded from the Larkin family, three and one-half miles south of town.

The article in last week's MINING AND SCIENTIFIC PRESS, "Why Mines Offered Are Not Sold," strikes a responsive chord and meets with approval among those striving to advance the mining interests of this county.

The outlook for the development of mining properties on this section of the mother lode never appeared so bright and encouraging as at present.

Brad Barnar and R. W. Dron of Glasgow, Scotland, are operating on the Potter property, one mile north of Kelsey. They bonded the claim from Rinaldo Fillipini, the merchant prince and cattle king of Garden valley.

Kohn, Kimball, and B. D. Pyke of San Francisco, locally known as the Big Three, have struck a rich channel pay streak in the Negro Hill section, three miles north of town.

Placerville, Jan. 25, '97.

E. W. and W. S. Chapman have put in a new 50-horse power, double electric hoist at their Zantgraf mine. The shaft at the mine is now down over 500 feet from the surface, or about 200 feet below the old tunnel. Sixty men are employed at the mine.

Inyo.

Register: Mr. Moore of Chicago has purchased a group of mines from Mr. Adler, on Blind Spring hill, and is running a tunnel to tap the ledge.

The Lane mine is looking well, the ore in the shaft being high grade.

The working force at the Snow's Canyon mine has been reduced, Mr. Garlick having enough ore out to make a test run of the cyanide plant.

Mariposa.

Gazette: R. D. Harper of San Francisco has bonded the Sierra Rica and Pedro Gosa mines on Bear creek from Kerrins and Bogan. Work on the property is to be commenced as soon as lumber can be hauled in. These mines have been good producers but have lain idle for a number of years, the last work having been done in 1878 by Kerrins and Snediker.

It is reported that several mines in the Sherlocks country have been sold to Fresno parties, who are backed by Eastern capital. These parties expect to erect an electric power plant below the falls on Sherlocks creek and operate the mines by electricity.

Mono.

Bridgeport *Chronicle-Union*: At the Dunderberg the mill is doing good work and everything about the works is in good running order. The tramway is complete and runs seventeen tons of ore an hour to the mill. The mine is looking well and it is probable the company will erect a cyanide plant next spring.

Nevada.

Union: The Ragon quartz mine, near the Stanford, has been bonded to Stockton men. The ledge is a good one and in the early days rich ore was extracted. There is a small hoisting plant on the property.

The lessees of the California mine, near the Reward, will put a steam hoisting plant on the property.

Placer.

Colfax *Sentinel*: At the Sellier mine rapid progress has been made, the rock in the tunnel being soft slate. An upraise to tap gravel will be started this week. A flume has been put in and a dump and large reservoir will be constructed.

Johnson, Graber & Dwyer are putting up a Huntington mill on the old Gayetty ledge, on the Bear river slope. Their ledge shows encouraging prospects.

The first car of machinery for the new stamp mill at W. H. Pierce's quartz mine, near Colfax, has arrived.

Argus: The new mill at the Marguerite is now running night and day on high-grade ore.

The Chicago Drift Gravel Mining Company, whose property is situated on the ranches of Threlkel and Zimmerman, in Long Valley district, started their 2-stamp prospecting mill on the 5th of January.

Plumas.

National-Bulletin: At Meadow Valley Prof. Price has completed his prospecting of the Diadem mine, having taken out over 400 samples, amounting to about a ton and a half of ore. He has developed a ledge of an average width of 50 feet, having crosscut it in ten different places on the 200 and 500-foot levels.

Riverside.

San Bernardino *Independent*:. The workmen in the new shaft being sunk on the Good Hope mine, near Perris, opened up a 20-inch ledge of rich ore last week.

Los Angeles men are backing Col. Hasson in developing the Little Maggie mine, west of Perris. There is an 8-inch vein that runs high.

W. Newport of Menifee lately purchased a promising free milling mine northeast of Perris. There is said to be a ledge 50 feet in width that will run $10 or $12 a ton. A tunnel will be run into the side of the mountain, tapping the vein at a depth of 700 feet.

San Bernardino.

Independent: At Ivanpah two or three of the mines of that old silver camp are producing pay ore, most of which is shipped to the Kingman sampler. Ivanpah has in days gone by produced over $5,000,000 in silver.

Eastern capitalists are negotiating for the purchase of the old Copper World mine, lying nine miles southwest of Ivanpah. Ore from this mine is said to run as high as 60 per cent copper, with a considerable valuation in gold.

B. M. Lawrence is still operating the Stonewall mine in the Ivanpah district. This mine has been on a paying basis for fifteen years.

The Bronze Mining Company at Vanderbilt will soon start up again.

San Diego.

Ramona *Sentinel*: The water has been pumped out of the Owens mine at Julian and the mine retimbered, and now, with the 10-stamp mill, about $8000 per month in gold bullion is being taken out.

Shasta.

Free Press: The placer miners in the Pittsburg mining district are meeting with success. Two men found a small deposit of gravel on Squaw creek, and in a short time took out about $800.

Miles and Keith have over three miles of ditch and are working in a 10-foot bank of rich gravel.

Salee and McDonnell have five men employed in their long tunnel on Bully Hill. They have passed through several small ledges of free gold, but are working for a larger ledge which appears upon the surface. They are now in about 800 feet.

Hart and Lanyon are opening up the Lone Rock mine on Riley bar near the Sacramento river and have sunk a shaft 44 feet deep in which they have found a 16-inch ledge of ore assaying from $40 to $50 to the ton.

A. C. Hamilton of Virginia City, Nevada, who recently purchased the Milkmaid mine near French Gulch, will shortly begin active operations upon the property on a large scale.

The thorough development of the Niagara mine near French Gulch is being pushed forward. A shaft has been sunk upon the ledge from the O'Neal tunnel.

Sierra.

Enterprise: On the Extension tunnel two ten-hour shifts have been put on and 40 feet of tunnel were made last week. The objective point will be reached in about four months.

Mountain Messenger: The German company at Minnesota are prospecting the old Cedar mine and are doing well.

The Plumbago mine is working a large force, driving tunnels and sloping.

At the Snowdown they are driving the main tunnel for the Old Yankee channel, which paid rich in early days.

Booth, Wright & Co. are working their claim on the north fork of Kanaka creek with fair results.

Siskiyou.

Journal: T. J. Nolton has contracted with I. N. Day of Cascade Locks and Grady & McArdle of Portland to transfer to them bonds on some valuable mining ground and numerous mining claims, amounting to several hundred acres, in the big bend of the Klamath river. The purchasers are to build a flume to carry 4000 inches of water from the east fork of Indian creek to the divide on the Happy Camp mountain, where it will cover ten miles of the richest portion of this famous gold stream.

The Nannette B mine on Klamath river, below Thompson creek, will be started up in about two weeks, at which time the water from the ditch and pipe will be turned into the giants.

News: The Columbia Gold and Silver Mining Company will put a force of men to work in the Columbia mine on Baldy mountain, near Scott Bar. Their ledge averages 2 feet in width and in many places it is 3 feet wide. They have about 1000 feet of tunneling, and a 10-stamp mill run by water power.

J. S. Fore of the Last Chance mine has his new improved elevator on the ground and will have it operating in the spring. The bedrock is about 50 feet deep from the surface, but carries coarse gold.

On the Olsen mine, below Sawyers Bar, they have struck another good pay channel. This mine consists of sixty acres of high ground, with a bank of gravel 150 feet high, and the improvements consist of a ditch from Canyon creek, half a mile long, and 1000 feet of 14-inch pipe, a No. 1 giant under 250-feet pressure, and a derrick for hoisting the boulders, operated by a current wheel in the river.

Journal: G. W. Grayson, Jr., of Oakland and Harry H. Hunter of Yreka have organized a company to work the Blue Gravel mine at Greenhorn, near Yreka.

Trinity.

Journal: It is reported that the Altoona mine is now employing eighty men, which force will be increased on entering the ledge. A shaft has been sunk to the depth of 80 feet. At the 50-foot level a station was cut, from which a drift was run to cut the vein at an estimated distance of 75 feet.

On East Fork on the Ozark mine a tunnel is being run on the ledge.

At the Enterprise the company are running the mill on good rock from the Lone Jack mine.

At the North Star eight men are employed and both mine and mill are running. They are working on a 5-foot ledge of ore.

Redding *Free Press*: A rich strike was recently made in the lower level of the old Lappen mine on Thorn gulch, at Deadwood. The property is owned by Tourtelotte, Brady and Cochran. At a depth of 400 feet a ledge of free-gold ore, which is from 6 to 18 inches in width, and yields $200 per ton, was tapped in several places.

James R. Eligh, who recently purchased the Bloss & McCleary gravel mine at Trinity Center, has struck a rich lead. Recently a great slide came down the mountain and the giants were turned upon it, and when the earth washed away a channel of rich gravel was encountered.

Tuolumne.

(Special Correspondence).—I have spent the past week among the mines of Tuolumne county, and everywhere found the mines looking better than ever before. At Soulsbyville the Black Oak is running under a bond of $300,000. The ore body is now 12 feet wide. Several teams are engaged in hauling ore to Oakdale, from which point it is shipped to Selby's, and nets the mine $40 a ton. The owners state that they now have in sight, between the 700 and 800 levels, $250,000. Mr. Storms is erecting a hoist on the Junction mine, adjoining the Black Oak on the south. The Junction is the property of the Mint employes. The Wheal & Perrin has a milling of ore out and will put it through the Soulsby mill to determine the value. The vein is of a good size, and there is no longer any doubt about the mines now being developed.

The Soulsby is again in active operation, after some fifteen years' idleness. The superintendent, Mr. W. Sharwood, has placed the old hoist on the Pennsylvania shaft and rebuilt the mill of fifteen stamps. The shaft is now down 220 feet; levels are being run, and as soon as they are out 100 feet, the shaft will be continued on down. The Soulsby vein is small in width, but large in gold value. In the past history of the mine the year's average of the ore was $35 a ton.

The rapid growth and evident prosperity of Jimtown, Quartz Mountain and Stent are the earmarks of a good mining section. A Scotch syndicate has taken the Atlas, on Jackass Hill, and the Keltz, east of Columbia, and are developing the Atlas. The ore is very heavily sulphureted, and should the numerous stringers once get together, it will give them a large-sized ore body. South, the Alameda is being put in shape to make it another Rawhide. The Rawhide has just had Demarest & Fullen put a large Cornish pump in place, and can now go on down into the mine's bonanzas. Nevills Jr. is getting the Alabama into good shape. The Whiskey Hill mine is now being developed. South, the Sweany lies idle. The Dutch is doing well. It has a fine hoist and the best superintendent's residence in the county. Down in the mine the ore bodies show where the money comes from, for this mine has been developed and equipped from the ore crushed in the mine's small 10-stamp mill. The ore body at this time is 65 feet wide, while the Heslep vein, to the east, has not been crosscut to. The App has a fine plant and is said to be in good ore on the Heslep vein. The San Ysabel is about to add twenty stamps. The Fitzgerald boys have been paid $80,000 for the New Era. This section prides itself on the Jumper and Golden Rule mines.

Real estate is advancing and the county shows the benefits arising from the present activity within the mines. Capital can at this time find a variety of investments that all promise well. E. H. SCHAEFFLE.

Murphys, Cal., Jan. 25th, '97.

Jamestown *Lode*: At the Jumper mine the 20-stamp mill crushes 55 tons daily.

Fred Cook has taken a bond on 100 acres of gravel mining ground below the junction of Wood's creek and the Tuolumne river, and has associated with him in the venture capitalists of San Francisco.

The Equitable M. & M. Co. of Stockton will have a 10-stamp mill running by April 1st on the Arbona mine at Tuttletown.

Sinking has been resumed in the Andy Johnson at Chinese Camp. The ledge is 4 feet strong in the bottom and the rock continues to show free gold in paying quantities.

Union-Democrat: The Black Oak mine, recently sold to Belgium capitalists, will be worked by its new owners on a large scale with the opening of spring, and will be equipped with improved machinery.

A concrete foundation for a 20-stamp mill is being laid for the Santa Ysabel.

Water is being hoisted from the Dutch mine to enable sinking on the vein to continue.

Negotiations are being carried to sell a dozen mines in the vicinity of Jackass hill, on the East lode, to an English company.

The Dead Horse mine, at Summersville, still continues a steady producer.

The Andy Johnson mine, at Chinese Camp, is being operated by half a dozen men.

Arrangements are being made for recommencing operations on the Garfield-Virginia mine, south of the Buchanan.

The Modoc mine, near the Buchanan, will shortly be equipped with a pump, to enable a closer examination of the property.

Independent: The Alameda mine is working a large force of men and building is going on rapidly.

The Draper mine at Soulsbyville is about cleaned out and sinking will shortly be resumed.

NEVADA.

A new ore body has been uncovered on the property of the Golden Eagle Mining Company in Humboldt county. The ore shows a valuation of from $50 to $100 in gold per ton. The company has just obtained a survey of its property, which embraces about twenty claims. As soon as the new working tunnel is completed the board of directors will meet to arrange for a mill. The ores are now being blocked out with a force of thirteen men.

On the Ophir group, the development of which is being promoted by the same gentlemen with few exceptions, the tunnel is being driven to cut the vein at a depth of 100 feet.

The owners of the Black Bird, which, has been productive of some very high-grade ore in the past, have patched up peace, and work has been resumed.

Pioche *Record*: At the Magnolia mine at De Lamar the new tunnel to tap the old works was run on a contract a distance of 850 feet to obtain air and connect with the old workings. A raise was made of 28 feet after the ledge was encountered. From the striking of the ledge in the new tunnel they have driven ahead 50 feet, all in good ore, and have not yet encountered the other wall. As yet no stoping has been done, the intention of the company being to block out the ore bodies and ascertain the full extent of the find.

Winnemucca *Silver State*: At Kennedy, J. A. Blossom is working ten men developing the Gold Note mine and taking out high-grade ore.

H. F. Bender is working four or five men on good ore.

Charles Kennedy is running the No. 5 tunnel in the Imperial mine, opening a ledge of sulphide ore that assays well.

Abel & Alexander have secured the old Coyote mine, and have purchased a 5-stamp mill, which they will erect.

Kyle & Houston are running a deep tunnel on the Key West mine.

White Pine *News*: The new strike in Granite district, Stepteo valley, is attracting much attention.

At Cherry creek the North Mountain Co. have decided to erect, in the early spring, three rolls with a large crushing capacity.

The Star & Grey Eagle Co. are pushing forward their work with two shifts of men, and will soon be ready for the machinery.

Walker Lake *Bulletin*: Twenty-one tons of Oneida ore, worked at the Hawthorne mill this week, produced a bar of bullion worth $2500.

OREGON.

Grant's Pass *Journal*: A movement is on foot looking toward erecting a smelting plant, or the application of some other process of treating sulphurets and ores of this district.

Times: H. A. Shorey and associates are operating the Lance property in Foots Creek

district (which they bonded for $30,000) on a larger scale than ever. They recently made the first payment of $2500.

The Black Channel Mining Co. of Foots creek is employing a good force of men, and recently contracted for 500 feet of 15-inch pipe.

Mansfield Bros. have purchased a claim near the Jewett mine, and are sinking a shaft to develop it.

Operations have been resumed at the Squaw Lake Mining Co.'s mines.

Baker City *Democrat*: At Virtue a one-half interest in the Uncle Dan mine in Quartz gulch has been purchased by a Mr. Vincent, who intends prosecuting development work.

The engine bed for the new engine at the Virtue is about completed.

W. O. Reynolds of the Flagstaff Mining Company has purchased in San Francisco machinery for the proposed mill to be erected at once on the Flagstaff mine.

WASHINGTON.

Spokesman-Review: In the Yakh district the Gold Flint management are driving their 400-foot tunnel as rapidly as possible and are in 170 feet. They expect to tap the lead May 1.

A fine body of ore has been struck on the Good Hope. The ledge is being crosscut, but the footwall has not been struck at a distance of 25 feet.

It is expected that work on the Jim Hill, owned by Judge Fleming of Texas and Senator West of Illinois, will commence about February 1.

BRITISH COLUMBIA.

The Victoria Board of Trade has proposed the following regulations as to mining corporations for the consideration of the Legislature:

"1. No companies to be registered to do business in this province except those organized under British or Canadian acts.

"2. The following scale of fees to be charged by the government on all mining companies incorporated:

Capital up to	*Fees to be Imposed.*
$100,000	$25
200,000	100
300,000	200
400,000	300
500,000	500
600,000	600
700,000	700
800,000	800
900,000	900
1,000,000	1,000

"3. Not less than one-third of capital to be set apart for 'working capital,' and which shall not be sold for less than par value.

"4. Careful revision and consolidation of the 'companies acts,' particularly as applying to the organization of mining companies.

"5. If at all possible, to prevent the repetition of the names of claims.

"7. The provincial government to require from all mining companies incorporated in British Columbia or registered under the companies acts 'foreign' an annual or semi-annual statement, should be published in pamphlet form, so that investors at home and abroad would be able to judge of the position of their investments. The statement should be in tabulated form, not too much in detail, but giving the most salient points, after the style of the Dominion banking returns: Authorized capital, treasury shares each, sold; treasury shares unsold; shipment of ore, tons; workmen; average value of ore shipped; length of time closed down; value of plant and machinery.

"8. That no shares (other than treasury) to be permitted to be issued until after a certain percentage (if only five per cent) of the treasury stock has been sold, and the money in the hands of the company."

Spokesman-Review: The Jumbo has made its first shipment of ore: two cars were loaded and sent forward. The ore comes from the maine sleighs.

The Sultana claim, on Lookout mountain, has been sold for $10,000 down, the remainder in thirty days. General Warren and a Manitoba syndicate are the buyers.

Hon. T. M. Daly, ex-minister of the interior of Cadada, with W. A. McDonald and A. Kelly of Brandon, Manitoba, have bought a half interest in the Golden Crown, in the Wellington camp, Boundary creek district, for $15,000, and have bonded the Calumet, in the same district, for $18,000.

Spokane *Chronicle*: A one-fourth interest in the Morning and Evening mines has passed from E. E. Alexander into the control of A. D. Coplen. Peter Steep has also sold his one-eighth interest to Milton Bentley.

The Gooderham syndicate, which purchased the War Eagle, will undoubtedly expend a vast amount of money in improvements in the Trail Creek district during the coming year. An agent of theirs has secured an option on a parcel of land and a water power on the river front in the southern part of the town of Trail. This fact gives some force to the statement that the Gooderhams will erect a smelter at Trail this spring.

The Sultana on Lookout mountain has been sold to Chas. S. Warren, D. W. Higgins, Governor McIntosh and Senator Kerchoffer of Manitoba. The purchase price was $10,000.

UTAH.

Salt Lake *Tribune:* The California group, consisting of fifteen claims in Camp Floyd mining district, has been secured on a lease and bond by Walker Bros. of this city, and active development is already commenced through a shaft on the Oregon claim.

Work has been resumed on the Badger group, between Mercur and Sunshine.

At Park City in the Daly-West, although the output at present is limited, the blocking-out of the ore bodies was going forward steadily. Mr. Daly says that the Peck concentrating plant through which the company will find a market for its low-grade ores will be erected.

In the Valeo it is expected that the ore body will be reached through the main tunnel in the next 50 feet, or at a distance of 325 feet from the mouth.

At the Lucky Bill the management is still drifting from the 1000-foot level. Ore showing as much as $16 in gold per ton is being encountered at intervals.

In the Primrose development is progressing steadily while ore is being taken out of a streak that varies from 10 to 18 inches.

In the Grand Central at Tintic early in January the drift on the 700-foot level, at a distance of 590 feet from the station, broke into the long-sought chute of ore. Since then the ore has been driven into for a distance of 40 feet, with a breast 5x7 feet. The metals occur in a gangue indentical with that existing at the Centennial Eureka and shows not only a high percentage of copper, but free gold. The exploitation of its ground was commenced nearly two years ago by the Grand Central Company and since that time about $115,000 has been expended.

In the West Dip at Mercur in all of the discoveries made the ore dips to the west and gets flatter as it goes, so that there is good reason for the belief that the ore is continuous through the whole valley, and close to the surface.

Bingham *Bulletin*: The Highland Boy Company are moving in the matter of erecting their mill, but it is probable actual work will not begin until spring opens.

Parties were here yesterday from New York viewing the result of recent operations at the Bingham tunnel, and it is understood that the great enterprise is to be pushed to completion at as early a date as possible.

The Red Wing, in its lower tunnel, McCarrick lease, this week tapped a good body of rich ore.

A twenty-five ton shipment of concentrates has just been made from the Last Chance mill.

Ore is moving from Bingham station at the rate of about five carloads daily.

The ore coming from the Old Jordan & Galena Company's mines this month is averaging between fifty and sixty tons daily, and may reach 1800 tons.

Shipments from the Old Telegraph this month have been lighter than for some time previous, and do not exceed twenty-five carloads.

Park *Patriot*: On a low estimate the value of the ore blocked out in the Daly-West is not less than $3,500,000 at the market values. If the much-talked-of new concentrator, a portion of which is built, should be finished, the Daly-West would be in condition to double its present force.

The mineralized rock through which the winze in the Ontario shaft No. 2 from the 1500-foot level is being sent down to the 1700-foot level this week is better than that through which it was passed last week. Twenty-four cars of first-class ore are being taken daily out of the winze, which is 140 feet below the 1500-foot level.

Tintic *Miner*: Salt Lake and Eastern parties have secured a lease and bond on the Fairview group lying on Mammoth hill. The bond runs for twenty months and the consideration is $75,000.

Options have been secured by local parties on several promising properties north of Eureka near the Rising Sun, and there promises to be a considerable movement there during the coming spring.

Mercur *Mercury*: The Brickyard has so much ore blocked out that they cannot do much more work to advantage until the new mill is erected. Most of the men have been laid off for a while.

The new working shaft in the La Cigale is commenced, and ore of good value can be obtained from the ground down.

IDAHO.

Spokesman-Review: Word came from Wallace that in the Treasure Vault fine bodies of ore have been uncovered. Work is being done through three tunnels, with ore in each. It is one of the few properties in the Cœur d'Alenes that shows peacock ores in any amount.

The Continental is showing a little ore in its upper tunnel, where 100 feet farther is expected to run into the heart of the chute. Its ore is peculiar, running silver in form of chloride, bromide and galena, lead in galena, chloride and crystals, copper and gold.

Mullan will add at least one to the list of producing mines of the Cœur d'Alenes during 1897, arrangements having been made to put a considerable force of men at work on the Central as soon as spring opens.

Wardner *News*: Manager McDonald of the Frisco mine, at Gem, has discharged about 100 of the miners. About 70 have been retained to do development work. The shaft will be sunk to a depth of 800 feet. When this development work is completed the mine will be in a better condition than ever before for handling the immense output which this property is capable of producing. A new Corliss engine has been ordered.

The Consolidated Tiger-Poorman will resume operations in a few weeks—possibly within one week. The water is out down below the 1000-foot level, and miners are already at work on that level. Over $125,000 has been expended in new buildings and machinery during the past year. The new concentrating plant has a treating capacity of 500 tons of ore, and is automatic all the way through.

MONTANA.

Butte *Inter-Mountain:* The semi-annual statement of the United Smelting and Refining Company of Jersey City, N. J., and Helena, shows that the plant of the company at East Helena and realty represents a cash value of $500,000, while ore and other personal property belonging to it are valued at $530,000. The liabilities of the company are $492,000. They are preparing another blast furnace and other improvements are being made. When the Missouri River Power Company completes its dam at Canyon Ferry, and is prepared to deliver electrical power, the company will introduce electricity into its works at East Helena.

Mining World: Sinking has been resumed at the Original at the bottom of the shaft, which is 800 feet deep, and will be continued at least to the 1000-foot level, where drifts will be run and ore stoped out. The shaft will later be sunk to greater depth. There is no question of ore bodies in this property, as the same lead runs through it as the one the Gagnon has worked for years to a depth of about 1500 feet.

WYOMING.

Denver *Republican*: The Grand Encampment mining district is commencing to attract outside capital, and within the last few weeks a number of transfers have been made. Ed Dickinson, general manager of the Union Pacific system, Thos. Sun, one of the best known stockmen in Wyoming, M. W. Dillon and others have located 4000 acres of placer land in the district, and have secured all of the unappropriated water in the north and south forks of the Grand Encampment creek. These placers are rich with coarse, heavy gold. A number of the business men of Rawlins are agitating the question of putting up a smelter for the reduction of these ores.

SOUTH DAKOTA.

Black Hills *Times*: The transfer of the Star group, of eight locations, between Spearfish and Iron creeks, for a consideration of $60,000, to R. H. Lilly, reported to represent the Horseshoe Mining Company, gives some idea of the rapid increase in the value of mining claims in the new camp.

Developments in Ragged Top camp have resulted in the finding of the same grade and character of ore in nearly every section of the Black Hills. The latest discoveries have been made in Carbonate camp, on Phœnix gulch, where Sol Jefferson has unearthed boulders which assay $30 per ton. In the same gulch, on the Blue Bird group of claims, owned by Wendel Koerner, the same character of float is found, which assays from $12 to $16 per ton. On the Geyser group, owned by W. D. Johnson and J. Goldberg, similar boulders are in evidence on the surface carrying from $12 per ton up. This rock, apparently a limestone, has lain unnoticed for years, and would have remained so if it were not for the discoveries made in Ragged Top.

The Calamity group, on the southwest slope of Ragged Top mountain, have been sold, together with the Banquillo lodes Nos. 3 and 4, to Eastern parties by the original locators, Mosher and Goodman.

The Dacey shaft in Ragged Top camp is 195 feet deep, the bottom being in yellow sand and bunches of ore.

The Union Hill M. Co. have their diamond drill in place at the bottom of the 320-foot shaft on their Union Hill group. A 200-foot hole will be sunk and a core of the material passed through be secured, when the drill will be removed to the Hoodoo tunnel, now in 425 feet. Horizontal bores will be driven, crosscutting the formation. Both tunnel and shaft are now in a good grade of ore and apparently the same body, though several hundred feet of virgin ground intervenes between. Supt. Grable is attending a meeting of the company, at which a contract for the erection of the new 200-stamp mill will be awarded. The company will build a railroad connecting their various mines with the mill and smelter, and electricity will be used as the motive power.

The old Hawkeye will retain its organization and absorb the property of the Pluma Company. The matter will be arranged in a few weeks, and as soon as it is perfected a large force of men will be put at work in the mines and the mills started.

The deal for the Sunset and Rainy Day lodes has been closed and the first payment made to the owners, Fish and Hopkins. D. C. Boley, the purchaser, will at once commence development work.

The new 500-horse power Corliss cross-compound engine at the Homestake old "80" mill has been started up. One hundred of the 200 stamps in the remodeled mill are dropping.

COLORADO.

The Black Wonder Company at Lake City, Colo., is putting in a gas engine and blower at the mine to furnish air to the lower workings which are at a depth of 636 feet. This company has a lixiviation plant at the mine which will be started to operating within a month.

At Cripple Creek at the Gold Queen, on Galena hill, a shaft down 65 feet discloses 4 feet of ore that assays from $20 to $32 a ton. A new steam plant has been ordered.

The Cripple Creek sampler has been purchased by a syndicate of mine owners, composed of Reed & McKinnie, Cobb & Wilson and Beiakadish. Possession will be given by Tutt & Penrose on March 1st.

The occurrence of galena in regular seam in the feeders now being cut in the Pointer is interesting. There appears to be a small zone stretching northwest from the Pointer toward Cripple Creek town, in which the principal values are in silver.

The St. Thomas, on Beacon hill, has been taken under $35,000 bonds and lease by a new company organized by Timis & Clapp.

The Cripple Creek district will have work for all the new mills now planned, and if the mines continue to turn out low grade ores as at present, there will be others needed soon. It has become a serious question with the mines where to dispose of their products. Every mill that treats the district ores is crowded beyond its capacity, with bins overflowing and sidetracks filled with unloaded cars. The present milling capacity of the camp is about 540 tons a day, and the mills under contemplation will add about 500 tons a day to the capacity. Inside of sixty days the cyanide mill at Florence will have increased the capacity of its plant 160 tons a day by the completion of the new roasting apparatus.

At Victor the Anglo-Colorado Exploration Syndicate will cut its group of 17 acres of Battle mountain into blocks and lease the entire ground, including the Rigi. The new shaft on the Rigi has produced 350 tons of ore in the past two months from development work alone.

A 12-foot vein, which gives average mill returns of $36, has been opened up at a depth of 78 feet in the Alpha property, on Beacon hill. The claim is under bond and lease to William Mendel of Cripple Creek.

The third installment of Elkton stock, amounting to 50,000 shares, and a portion of a block of 300,000 shares, secured under option last August by a French syndicate, has been accepted on behalf of the foreigners. The price agreed upon was $1 a share. By clearing the 50,000 shares, the Frenchmen have now absorbed 200,000 of the 300,000 shares on which they hold an option. The remaining 100,000 shares must be taken up at the rate of 50,000 shares or more per month.

Near Georgetown the Allunde Consolidated Mining Company, which now owns the properties of the Colorado Central Consolidated Mining Company, the Equator Mining and Smelting Company and John Turck, keeps employed from 65 to 70 men, and a vast amount of dead work has been done since January, 1896, repairing and retimbering workings that had gone to decay from disuse caused by contention in the courts. These different properties have produced about $5,000,000. The Colorado Central alone has paid during its lifetime $530,000 in dividends.

The Doric Gold Mines (Limited) is an English enterprise and has erected one of the finest air-compressor plants and buildings in the State. They own 28 claims on Saxon mountain, and also lease and bond on eight other claims. They are driving an 8x8-foot cross-cut tunnel to develop their claims. In the first 500 feet they have encountered three of the lodes, each in fair ore, and shortly intend to drift on them.

The Dunderberg mine, at Brownville, has been steadily developed for the past year or more with a force of 74 miners, and has been making regular shipments.

At Telluride, E. J. Field, general manager of an Eastern company, which has an option on Pinch Bros.' group of gold properties, the Nellie mine, and Closett & Stansbeck's property, the Star Grazer, is having development work pushed as rapidly as possible. The Stella tunnel is being driven ahead with three shifts of men and is in a distance of 350 feet on the vein.

A party of experts have been making an examination of the Silver Pick group of properties, on Mt. Wilson, the past several days, for English capitalists.

One of the most important mining deals recently consummated is the consolidation of the Cheesman and Joe Hill tunnel interests on Battle mountain, Red Cliff mining district, and the formation of the Eagle River Mining and Tunneling Company, with a capital of $3,000,000. The consolidation puts the new company in possession of a very large area of mineral ground on Battle mountain. The plans and surveys have been made for the construction of a two-track tunnel, 9x9 feet in the clear and 3000 feet long.

ARIZONA.

Bisbee *Orb*: South of Crittenden, the Empire Smelting Company has purchased a tract of land from R. R Richardson, on which a townsite has been laid out and a large smelter has been built. The new town is called Rollin. The company has bought the Hardshell mine, twelve miles away, and the Flux, but two and a half miles distant, and is building roads to each.

Twenty teams are busy hauling ore from the old Holland mine near Washington camp in the Patagonian mountains.

The DuQuesne people are doing much development work and have a hoist and other machinery ample to go to the 600-foot level. So soon as a sufficient amount of work is done to justify, a smelter will be erected.

W. A. Clark of Butte, Montana, who owns the United Verde mines at Jerome, has secured the Pride of the West, a copper property of promise, and a large force of men will be put at work immediately. This claim was recently bonded for $80,000, but the sale did not go.

At Harshaw, Frank Powers is building a new concentrating mill at the World's Fair mine. The property is a silver mine and rich.

Globe *Silver Belt*: Lewisohn Bros. have seventy-five men at work in the Rosemont copper mines and expect to increase the force.

Developments in the Lost Gulch mine have opened an important ore body. A large amount of work has been done in opening the mine during the past few months and the discoveries of ore have exceeded the sanguine expectations of the management. The mill is of ten stamps, and about twenty-five tons of ore are run through daily. The force of men now employed numbers thirty.

The shaft on the Black Copper is down 230 feet and a crosscut is to be started at that depth. Work on the Dadeville goes on and the crosscut at the 75-foot level has been driven 15 feet in good ore. The ledge at that depth is supposed to be at least 20 feet through.

Eight copper claims owned by J. H. Durham, Ed S. Lyell and Jas. Flynn, near Owl Head, Pinal county, were bonded Dec. 3rd last to English capitalists for $35,000.

Prescott *Journal Miner*: At Oro Blanco the Old Glory has opened a true fissure vein with well defined walls and 8 feet of vein matter that assays $40 per ton.

A bond for twelve months has been given to Thomas Whitney, of Chicago, for the Connecticut mine, in Hassayampa district. The owners of the mine are Fred Sattes, Juan Robles, Julian Mora and Peter Omallia. The purchase price is $5000, of which $500 was paid in cash.

The company which recently purchased the Standard and Buster mines, in the Bradshaw mountains from John McKenzie, will shortly commence active operations.

Scientific Progress.

Roberts-Austen's Discovery.

Prof. Roberts-Austen's discoveries on the interdiffiusibility of metals have been taken up by the Royal Society of England. The facts have been to some extent known to savants before, but now the results are made more clear. It is shown that solid metals may be made to mix themselves as if the atoms were living creatures. Prof. Roberts-Austen has, in fact, discovered pieces of metal engaged in the very act of mixing themselves up with each other. Of course, the interest of this is that the interdiffusion had been found to take place when the metals were cold, and though this property in metals, to be capable of attaching themselves one to the other when cold, has been talked about before, nothing so clearly proved has hitherto been at the service of metallurgists and chemists as the facts adduced by Prof. Roberts-Austen. He shows that when clean surfaces of lead and gold are held together in the absence of air, at a temperature of 40° for four days, they unite firmly, and can only be separated by a force equal to one-third of the breaking strain of the lead. The professor has also proved that if a plate of gold be laid under one of lead about three-tenths of an inch thick, in three days gold will have risen and diffused itself to the top of the other metal in very appreciable quantity.

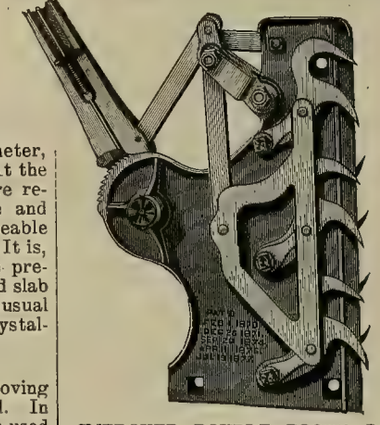
A Property of Compressed Air.

Compressed-air motors have been in successful operation in France for many years, and they are now rapidly establishing themselves in public favor in the United States. They have been constructed and tested at Rome, New York, continuously for two years, in all conditions of weather, and have given satisfaction even at temperatures below zero. Several motors are now, and have been, running for some months on the 125th-Street Railway, in the city of New York, in daily service, without having lost a trip and with great satisfaction to the public.

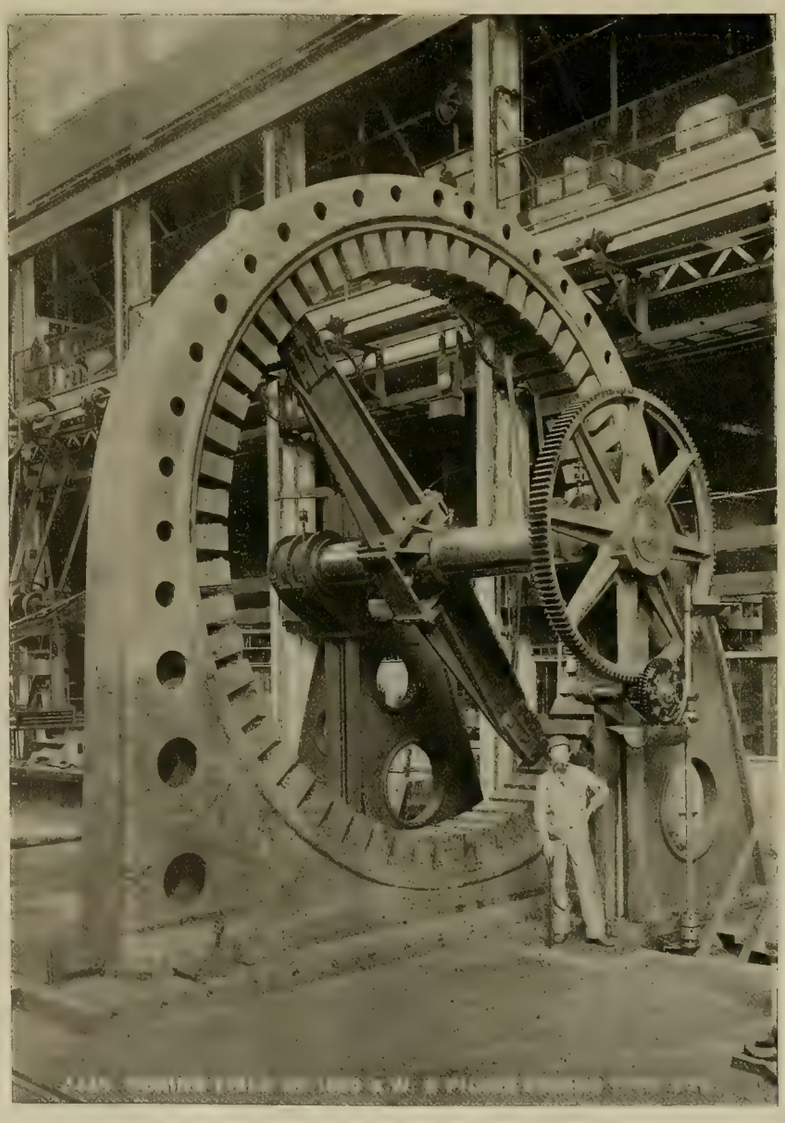
A remarkable property of compressed air is that its efficiency can be doubled by reheating. This is not theory; the fact has been confirmed by actual demonstration, both in Europe and America. It may appear incredible and contrary to well-known physical laws that the efficiency of air can be doubled by simply passing it through a tank of hot water before admission to the motor cylinders, but such is the fact, and the reheating which doubles the power represents a consumption of coal only one-eighth of the amount required at the power station to produce the compression.—Herman Hauph before the Franklin Institute.

EXPERIMENTS at the imperial navy yards at Wilhelmshafen have shown conclusively that aluminum cannot be used practically in men-of-war construction, while aluminum bronze has turned out satisfactorily in many cases, when the alloy contained 94–96 per cent of aluminum and 6–4 per cent copper, says *Engineering Magazine*. After investigating and testing aluminum in certain parts of vessels, the following conclusions were arrived at: Aluminum bronze is useless for bearings, valves, etc., on account of the rapid wearing away; it has been found useful, however, for various parts of machines where friction is not an important factor, and also in cases where light weight is an object. Furniture made of aluminum showed decidedly too little resistance and required frequent repainting; aluminum shows, furthermore, but little resistance to sea-water, thus making it useless for the walls of vessels. A 10 per cent aluminum bronze, however, stands a fair chance of being freely used as soon as the price of aluminum can be sufficiently reduced to approach the value of cast steel.

WARREN M. FOOTE of Philadelphia gives, in the *American Journal of Science*, an account of a meteorite which was seen at its fall by M. Bartlett of Florence, Arizona. It passed through the heavens in a southerly direction and fell with a report like that of a cannon. The new-found meteorite is a typical example of the class of siderites, weighing about 521 pounds, and about 92 inches long, 24 inches broad and 8 inches thick. Mr. Bartlett says: "It has the characteristic 'thumb' marks, and on a flat side it has two cup-shaped pits from 4 to 6 inches in diameter, which is a remarkable feature. At the point where the fragments were removed the octahedral cleavage and lines of crystallization are noticeable to a degree rarely seen in iron. It is, however, on the etched surface prepared through treating a polished slab with dilute nitric acid, in the usual manner, that the beauty of the crystalline structure is best seen.



THE use of sand blast for removing old paint from iron is being tried. In one instance the sand blast was used to clean between decks of a cattle steamer, which was in an exceedingly bad condition. The results were highly satisfactory as to quality of work done, but the time consumed was excessive. The air pressure used was, however, only about ten pounds per square inch, and it is, therefore, reasonable to suppose that if, say, from forty to fifty pounds pressure has been used, the results might have been satisfactory in point of both quality and economy of work. At any rate, it would seem worth trying the process further. The promise of money saving that it holds out is certainly seductive.



Mechanical Progress.

Improved Double Tooth "Reliance" Dog, Made Entirely of Steel.

These dogs are made both right and left hand and can be bolted to the knee or standard of any sawmill head blocks. The cut herewith represents a right-hand dog, which is made to bolt to the right-hand side of the knee, viewed from the platform of the carriage, where the setter works. This dog combines all the best features of the "Reliance" single-tooth and "Boss" double-tooth dogs, and has double-grip hook teeth, working in both directions, up and down, and all operated by one lever, made entirely of steel, and so constructed as to be used to bolt to knees of any head block, or inserted and used in a patent hollow knee. The lever has a downward movement to dog log or cant and is held firmly in position by a ratchet and stop, operated by hand piece on the end of lever, making it impossible for the teeth to work out and release the cant or log and allow it to crowd or break the saw. They are made for both high and low knees. Extreme height of high-knee dog is 26 inches and that of the low-knee dog is 18 inches; furnished by the Edw. P. Allis Co., 9 Fremont St., San Francisco.

IMPROVED DOUBLE TOOTH DOG.

LARGE GENERATOR IN COURSE OF CONSTRUCTION.

Largest Generators for Lighting.

The four largest dynamo electric machines ever constructed, to be used primarily for lighting purposes, were installed last month by the Westinghouse Electric and Manufacturing Co. at the central station of the Allegheny County Light Co. of Pittsburg, Pa. Each of these generators has an output of 1500 kilowatts (2000 H. P.). They are wound for 2400 volts and at a speed of 116 R. P. M. deliver two-phase currents at a frequency of sixty cycles per second (7200 alternations per minute)—that is to say, the direction of the current is reversed 7200 times per minute.

These generators, says the *Scientific Machinist*, are of the same general design as our standard engine-type machines and are direct connected to Westinghouse marine-type compound engines. The distinguishing feature of engine-type generators is the manner of mounting the armature. The armature is keyed to the engine shaft, and, revolving in the magnetic field, becomes the fly-wheel of the engine. The energy of the great 5000 H. P. machines installed by the Westinghouse Co. at Niagara Falls is chiefly used for general industrial purposes, such as the operation of machinery in mills and factories, the operation of street railways and electrolytic purposes. The principal use, therefore, of that plant is to supply power, while lighting is merely incidental. These generators will be used chiefly for lighting arc and incandescent lights, though a considerable amount of power for polyphase motors is provided for by the same generators and distributing circuits that supply the lights, so that they are the largest machines of their class ever constructed.

In the illustration the armature and field bobbins are not in place. This is merely a shop view showing the field casting being turned true in a lathe. The sixty-two field poles of this machine are constructed of a great number of thin sheets of steel punched into suitable form and cast into the yoke or frame. These are secured together by end plates, which are held by long rivets passing through holes provided in the plates and the sheets of steel. The height of each generator from the bottom of the bed plate to the top of the field is 22 feet 7 inches. The weight of the armature (the revolving element) is 73,925 pounds. The weight of the machine complete is 226,522 pounds. The system employed is known as the Tesla polyphase alternating current system. Each generator delivers alternating currents to each of two circuits, the currents in these circuits differing from each other in their time relation, or phase, by 90°.

THE observation made by Mr. Alfred Springer five years ago that the acoustical properties of aluminum are approximate to those of wood, has been verified by continued experiments with sound-boards of that metal, and the author exhibited in the American Association several aluminum violins, together with a device, called a bass bar, by means of which the quality of the tone produced by the instrument can be controlled.

Electrical Progress.

Electric Energy From Coal.

No means has been found for the direct determination of the solution pressure of metals, but it may be calculated from the difference in potential between a metal and a solution of one of its salts, says the *Electrical Review* of London. Methods for the determination of the latter have been devised by Ostwald, and improved by Paschen. By the use of these and other constants, which the researches of physical chemistry have placed in his hands, the physicist can now calculate the electromotive force which can be obtained by various combinations of metals and solutions. On this side the theory has rendered essentially the same service for the galvanic cell which the atomic theory rendered for chemical compounds when it furnished the means for calculating their percentage composition. As in the early days of the atomic theory, many of the constants in question are imperfectly known, but since the theory has shown clearly their independence, new means for their determination and for the control of their accuracy are constantly being discovered. Every one who is familiar with the extremely wasteful character of all processes now at our disposal for the transformation of chemical into mechanical energy, must have had the thought that there is surely some means of saving a part of the enormous loss. At present, the attention of the scientific world is turned toward the transformation of the chemical energy of coal into electrical energy as the probable solution of this problem. It seems to be almost certain that physical chemistry has already made clear the principles by means of which such a transformation may be accomplished. Indeed, Dr. W. Borchers, by the use of a solution of cuprous chloride with producer gas, or carbon monoxide on one side and air on the other, has already obtained an electrical current which corresponds to a transformation of 30 per cent of the chemical energy into electrical. This is an efficiency three times that of the best steam engines. There is no probability that this method can ever be practically useful, but that a practical method will soon be discovered is, at least, possible.

Electric Traction in the Sewers of Paris.

Ever since Victor Hugo made famous in "Les Miserables" the sewers of Paris, they have been one of the sights which venturesome visitors to that city aimed to see. It now seems that even these have been invaded by electricity. A contemporary, in describing them, says:

"The boats are used in the larger tunnels, which are some 10 feet high and 18 feet broad, with a rectangular channel in the floor forming a canal 10 feet wide and 3 feet 6 inches deep, along which the sewage flows. The smaller branches are similarly constructed, but the canal is under 4 feet wide, and cars with flanged wheels run on the edges of the channel, which act as rails. The primary object of both boats and cars is to drag scrapers for cleaning the channel—the admission of visitors being, as it were, an accidental adjunct. Both cars and boats are now propelled by electricity derived from accumulators contained in the leading vehicle, and weighing from 40 to 14 cwt. In order not to unnecessarily stir up trouble—and other things—from the liquid depths, the boats have no screws or paddles, but propel themselves by picking up a chain laid along the bottom of the sewage channel and passed over a driving pulley geared on to the motor. The train consists in busy times of six boats or cars and will accommodate as many as 100 persons."

A New Light.

Prof. O. Schutt of Jena has invented what he calls the electro-capillary light. He finds that when a discharge of an induction coil is sent through a capillary tube of about 0.05 mm. diameter, provided with aluminum or copper electrodes, and filled with air at ordinary pressures, an intense luminosity is obtained—a luminosity which is described as "intrinsically far superior to that of the arc." Wider tubes give less light.

The difficulties in the way thus far are that the light is not continuous and tubes of proper diameter for the best results deteriorate rapidly.

Practical Information.

Oldest Iron Bridge.

The idea of building iron bridges is first found, according to Ganthey, in Italian writings of the sixteenth century, and French engineers tried to act upon it in the beginning of the seventeenth. Desaguiliers planned an iron bridge over the Thames. Garrin commenced in 1719 with the construction of an iron bridge over the river Rhone at Lyons, but the difficulties and cost of the work discouraged him, and the bridge was finally built of wood. At that time only chain bridges were known, apart from wood and stone structures. Chains were strected from one bank of a river to the other, and the flooring placed directly upon them. Bridges of that kind originated probably in China. Anastasius Kircher describes in 1667 a bridge at Kin-tung, China, which was supported by twenty iron chains. The military bridges of the seventeenth and eighteenth centuries were of similar character.

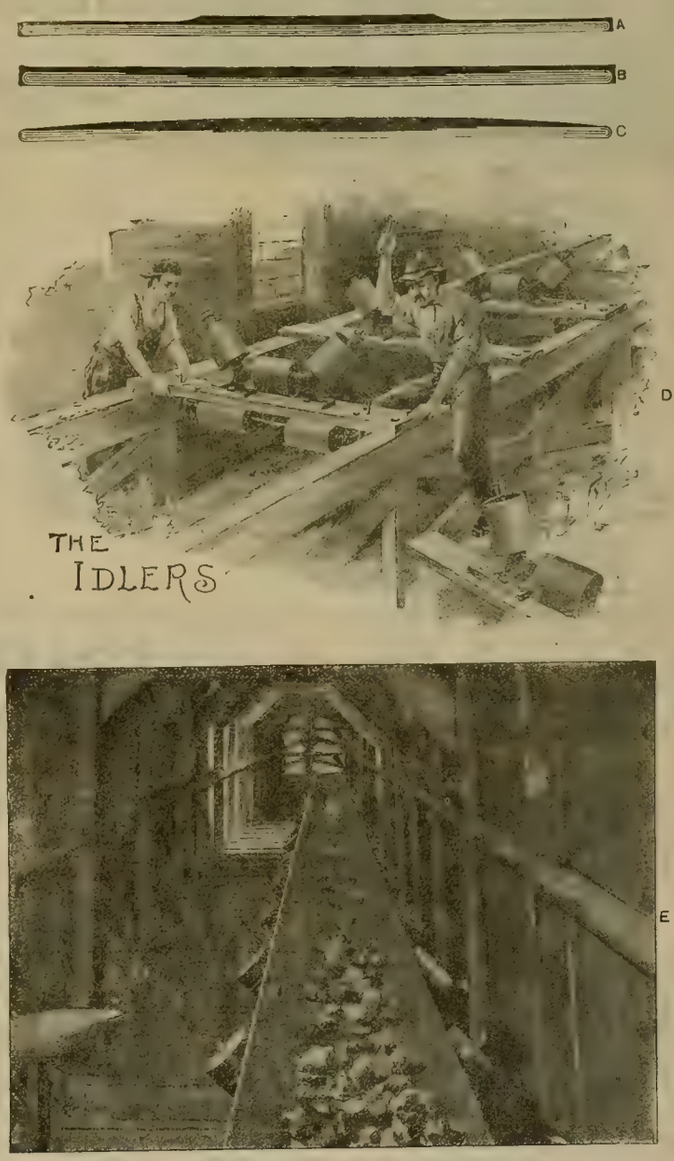
It was in England where the first permanent iron bridge was built. It is the cast iron, one-span bridge over the Severn, near the famous Coalbrookdale Iron Works, in Shropshire. After this pattern many cast iron bridges were manufactured in England during the last two decades of the eighteenth century and shipped even to America.

The material for the Severn bridge was cast by the Coalbrookdale Iron Works in 1776 to 1779, and in the latter year the bridge was open for traffic. It is still in excellent preservation and is in daily use for a considerable traffic over the river Severn.

Mining at Great Depths.

B. H. Brough, in his recent lecture on "The Problems Associated With Mining at Great Depths," said that the maximum depth had reached 4900 feet at the Red Jacket shaft of the Calumet and Hecla mine, in the Lake Superior district, and the only other mine over 4000 feet was the Tamarack, in the same district, which is 4450 feet deep. Of mines over 3500 and under 4000 feet there were four in Germany, two in Belgium and one in Austria-Hungary. The deepest British mine is sixth on the world's list. It is the Pendleton, near Manchester, and is 3474 feet. The deepest in Scotland was given as the Niddrie, at Portobello, which is 2010 feet. Mr. Brough dealt with the difficulties of deep mining; and he stated that the cost of hemp ropes used to be 6d. per ton of output, but now crucible steel wire ropes were used, and in one case a flat rope weighed only 8.2 pounds per foot, had a tensile strength of 89 tons per square foot, raised loads of 11 tons from a depth of 3117 feet, and yet lasted twelve months. At the deep mines of Calumet the cage, carrying six tons, was lifted at the rate of a mile in 1½ minutes; in England the speed has been as great as 57 miles an hour, and the lecturer pointed out that the best way to increase the speed of winding was to slightly increase the steam pressure and the size of the engines. In the Marchiennes mines the shaft was small in diameter, although nearly 4000 feet deep, and 10 and 12 deck cages were used, the cage weighing 8800 pounds, and carrying 13,200 pounds; but in Kimberley mine of 1100 feet depth, 3665 tons had been taken out in 11½ hours.

RECENT experiments show conclusively that the gas consumed in one 16-candle power gas jet, if consumed in a gas engine, will produce three 16 C. P. electric lights.



THE charter of the Bank of France expires next year, and the bank officials have been in negotiation with the Government for some time to arrange the terms upon which a renewal of the charter will be granted. The Bank of France has always been exceptionally strong, having accumulated the largest amount of currency, both gold and silver, of any of the European national banks. The charter of the bank is to be renewed and extended, under the agreement just reached, for twenty-three years, but with some changes. The limit of the note issue is raised from 4,000,000,000 to 5,000,000,000 francs—$1,000,000,000. New burdens, however, and new services are imposed. The bank is to advance to the Government 40,000,000 francs free of interest, and is to renounce interest on loans made to the Government in 1857 and 1878, aggregating 140,000,000 francs. About 7,000,000 francs of the bank's notes are supposed to have been destroyed—having been out for a long time and never presented for redemption. The bank is not to gain by this loss of the noteholders. The Government takes the 7,000,000 francs and assumes the responsibility of redeeming the notes if they are ever presented.

A STRIKING illustration of the influence of fatigue upon the nervous system is afforded by an experiment conducted by an Italian physician some months ago. Twenty-four bicycle riders who had ridden thirty-two miles in two hours and a quarter were examined with reference to their hearing, and it was in nearly every instance found to be defective. After two hours' rest the hearing had become nominal in most of them.

Rubber Belt Conveyors.

The accompanying illustrations of rubber belt conveyors is one that needs but little explanation. Its simplicity will be apparent at first glance, while its efficiency is demonstrated in the many plants where the same is now in use. The manufacture of this style of conveyors has been taken up by the Jeffrey M'f'g Company. The special rubber belt and idlers, as shown, are manufactured under the Robins patents. Illustrations *A*, *B* and *C* show three styles of rubber belt. The trouble heretofore has been to get the proper kind of material in a rubber belt which will stand the wear and tear occasioned by the material falling upon it. This has been brought to a high degree of perfection in the Robins belt. The reinforced thickness of rubber on the belt insures long life by having the carrying side strengthened where it is mostly needed. Fig. *D* shows the supporting rollers and idlers, which are very simple in construction and make the erection of this system comparatively inexpensive.

Fig. *E* is an illustration of the conveyor as it appears in operation. This rubber belt system is arranged to deliver the material at the terminals or along the line, and is especially desirable in the handling of ores, broken stones, sand, clay, fertilizers, grain, coal, etc. For catalogue and prices, address the Jeffrey M'f'g Company at Columbus, New York, Chicago, or Denver.

RUBBER BELTS AND CONVEYORS.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

Copper and Lead Furnaces.

The Mine and Smelter Supply Co.,

. . . DENVER, COLORADO, . . .

ARE SOLE AGENTS FOR THE

Wilfley Concentrating Table,

And claim for it BETTER work than any Concentrator made, with a capacity of from 15 to 25 tons per day of 24 hours. It is simplicity itself. No moving belts or intricate parts. Anyone can learn to operate in an hour.

For confirmation of all of the above we refer to Henry Lowe, Puzzle Mine, Breckenridge, Col.; M. E. Smith Concentrator, Golden, Col.; Mary Murphy Mine, St. Elmo, Col.; W. E. Renshaw, Mayflower Mill, Idaho Springs, Col.; W. H. Bellows, Boyd Mill, Boulder, Col.; H. E. Woods, Denver, Col.

ROMLEY, COLO., Jan. 19, 1897.

The Mine and Smelter Supply Co., Denver, Colo.—GENTLEMEN: Answering yours of the 5th inst., would state that after a thorough trial we have discarded nine other concentrators and adopted the Wilfley Concentrating Table, which we think up to date is the best table in the market, so far as our knowledge is concerned. Yours very truly, [SIGNED] B. B. MORLEY, M'g'r Golf M. & M. Co.

These Tables have displaced belt tables of almost every make, as is shown by letters in our possession.

PRICE, $450.00.

Office and Works: 409 MARKET ST., SAN FRANCISCO, CAL.

Coast Industrial Notes.

—Forty-five car loads of walnuts, valued at nearly $70,000, were shipped from Fullerton, Cal., last year.

—American railroad interests and British commercial influences have succeeded in sidetracking the Nicaragua Canal project in this session of the national Congress.

—The Suisun, Cal., Board of City Trustees has awarded $42,000 water bonds to the San Francisco Bridge Company, which contracts to put in water works for $32,034.

—The San Pedro Oil Company has incorporated at Los Angeles; E. T. Howe, Pasadena; W. H. Obear, W. Duncan, A. Dodd, Los Angeles; H. J. Muller, San Pedro; capital stock, $500,000.

—The McCloud River Railroad Co. has incorporated to build from Sissons to Fall river, in Shasta county, Cal. W. E. Brown, W. W. Van Arsdale, D. W. Earl, J. D. Brown and G. W. Scott have each subscribed $13,200.

—The Fitzhugh Electric Power Company of San Francisco propose to build an electric plant on the Stanislaus river, three miles from Tuttletown, Cal., with 3000 horse power, to deliver to the mines from Fourth Crossing in Calaveras county to Jacksonville.

—At a meeting of the Ways and Means Committee of the State Legislature last week it was decided to recommend for passage the bill appropriating $10,000 for an exhibit of California products at the Guatemalan Exposition to be held this summer.

—A contract was granted by the Mexican Government for the construction of a vitrified sewer pipe factory in the City of Mexico to C. C. Merrill of Los Angeles, and it was completed last month. A bond in $10,000 was deposited as a guarantee that $400,000 would be expended.

—E. B. Rambo of San Francisco has concluded the purchase of 130 acres of land lying on San Diego bay, above Roseville. It is claimed that a railroad deal is in progress to connect Salt Lake and San Diego and giving the Union Pacific an outlet to the Pacific Coast independent of the Central Pacific, and that this purchase was made in the Vanderbilt interests.

—D. McLean tells the Salt Lake, Utah, *Herald* that "the Pacific Short Line is to be built through to the coast, grading to begin about May 1st. C. K. Bannister is to be the chief engineer in charge of the entire line. The route is through Ogden and Salt Lake, around the lake to the south; across the Deep Creek country, over Beckwith's pass and on to San Francisco."

—Work has been resumed on the tunnel of the Turlock Irrigation Canal system, under a contract entered into with Judge J. A. Waymire in the spring of 1896. There remains 250 feet of the tunnel, out of a total of 650 feet, to excavate. Waymire's contract is for the payment of about $350,000 for putting the entire system in working order, so that the water will run over the district, which comprises 170,000 acres.

—The Mexican government has awarded the contract for the making of a harbor where ships may safely anchor at Mazatlan. The specifications call for the construction of a first-class harbor with a depth of not less than 30 feet, thereby facilitating the anchorage of ships of the heaviest tonnage. At present ships anchor in the roadstead, but it is thought that the harbor can be safely made in what was originally known as the Puerto Viejo, and where ships formerly hove to. The amount to be expended will approximate $10,000,000 Mexican silver.

Recently Declared Mining Dividends.

The Coronas M. Co., Mexico, $1500, Jan. 15th.

Portland M. Co., Colorado, 1 cent per share, Jan. 15th.

Ontario, Utah, M. Co., 10 cents per share, payable to-day.

Santa Rosalie, Mexico, M. Co., 5 cents per share, Jan. 26th.

The Homestake, South Dakoka, 25 cents per share, Jan. 25th.

Alaska-Mexican M. Co., 10 cents per share, $18,000, Jan. 28th.

Alaska-Treadwell M. Co., 37½ cents per share, $75,000, Jan. 28th.

The Elkton Consolidated, Colorado, 20 cents per share, $25,000, Jan. 20th.

Anchoria-Leland M. Co., Colorado, 1 cent per share, $6000, Jan. 15th.

Boston-Montana, Montana, $450,000: payable Feb. 20th. In 1896 the company declared two dividends of $2 each and two dividends of $2 and $1 extra each, making $10 per share on 150,000 shares for the year. In 1895 the company paid $2 on May 20th and $5 on Nov. 20th, or $7 for the year. In 1894 it paid two dividends of $1 each. This dividend makes total dividends to date $5,375,000.

THE OVERLAND LIMITED, VIA UNION PACIFIC

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

Kensington G. M. Co., San Francisco; F. L. Colton, J. G. Brown, E. and W. M. Painter, A. W. Moore; capital stock, $100,000—$250 subscribed.

Reddick Mining Co., Grass Valley, Cal.; capital stock, $100,000—all subscribed; J. F. Kidder, E. H. Brown, G. Fletcher, Grass Valley; C. P. Longbridge, Nevada City; W. E. Brown, San Francisco.

Colorado River Mining Co., San Diego; capital stock, $1,000,000—all subscribed; J. H. Bowman, J. Connor, Holbrook, Arizona; G. W. Beermaker, W. F. and J. L. Stearns, Chula Vista; J. R. Stearns, Tia Juana; C. Kiessig, L. L. Greenwart, San Diego; M. Davis, National City.

Personal.

J. R. SMITH has been appointed superintendent of the Reward mine, on Grass Valley creek, Amador county, Cal.

HENRY BRATNOBER has left New York since the close of the deal in the Tomboy at Telluride, Colorado, and will go to Tintic and other camps in Utah.

ROBERT DUNCAN, JR., superintendent of the Alaska-Treadwell properties, has returned to Alaska, but is expected to come to San Francisco again within a few weeks.

VICTOR M. CLEMENT, formerly of Grass Valley, who has returned from South Africa, is making an examination of the Mercur property in Utah, upon which Capt. De Lamar has an option for an English syndicate at $1,500,000.

COLORADO'S GOLD FIELDS.

Millions Upon Millions of Dollars in Gold Have Been Added to the World's Wealth.

It is a well-known fact that the richest and most famous gold mines in the known world are those of Colorado, many of which are paying to fortunate investors millions of dollars annually in dividends. Some shrewd persons who invested only a few dollars are now receiving hundreds and thousands in profits, and, judging from present indications, there are more desirable chances to invest just now than ever before. New mines are discovered daily and old ones strike richer veins of gold.

In order to meet the great demand for reliable information about mines and mining camps, one of Denver's oldest and best known publishers has just issued a handsomely illustrated book accurately describing every mining camp in the entire State of Colorado, giving scores of truthful photo-engravings of famous mines, mountains, cities, etc. Cripple Creek, the world's wonder, is fully described; also a correct map of the district. Narratives of how many poor people have become wealthy by judicious investments in gold mines, and sketches of former prospectors who are now fixed for life. Tells how to avoid unscrupulous brokers and sharpers. The volume has been carefully compiled by a disinterested author and every statement made is guaranteed to be true. All terms and phrases of miners fully explained; tables showing the State's production of gold and silver for 35 years past. The publisher will send by return mail a copy of the above great book upon receipt of 25c. (currency or stamps), which also includes a 3-months trial subscription to his big 56-column weekly family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado (established 1890). Clubs of 5 and 6 books, $1. The paper contains each week all the latest mining news and illustrations of Rocky mountain scenery, also true stories of love and adventure. Cut this out. Address as above and mention The Press when you write. It is reliable.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

A Great Mining Triumph.

Capt. J. R. DeLamar, of New York City, is one of the largest owners and workers of Gold Mines in the world. After the most careful investigation he purchased in August, 1895, two Griffin Mills, and his report is so remarkable as to demand the careful attention of every one interested in Gold Mining.

We give it in his own words.

NEW YORK, Jan. 9, 1896.

BRADLEY PULVERIZER CO. *Gentlemen:*—The two Griffin Mills have been in operation now for 90 days on the hardest rock, with the exception of corundum, that I have ever met during my mining life. They have taken the rock direct from the breaker, and they average about 20 tons to each machine, 40 mesh fine, without elevating or bolting. We simply put a ¼ mesh screen around the Griffin Mill, and the stuff comes out 40 mesh, fine or over, which makes it an excellent pulp for leching by cyanide or chlorination; therefore we have concluded to order **10 more Griffin Mills**. We have tried high-speed rolls and dry stamps, and after looking into the Huntington Dry Pulverizer, the Narod Pulverizer, the Stedman Pulverizer, the Frisbie Lucop, the Cook, and various other dry pulverizers, unhesitatingly recommend your Griffin Mill to any one.

Yours truly, (Signed) J. R. DELAMAR.

HOW 10 GRIFFIN MILLS WORK.

DELAMAR'S NEVADA GOLD MINING CO.,
SALT LAKE CITY, UTAH, Nov. 24, 1896.

BRADLEY PULVERIZER CO. *Gentlemen:*—In answer to your inquiry as to what the "Griffin Mill" is doing at our DeLamar Mill, DeLamar, Nevada, we beg to state that we often run 310 tons per day with 10 of your mills in operation, and on one occasion these 10 mills produced 408 tons in one day. I have no hesitancy in stating that they will regularly produce at least 30 tons per day each on our ore, which is extremely and unusually hard.

Yours very truly, H. A. COHEN, *General Manager.*

These strong letters coming from such representative men are conclusive evidence that we are right in claiming that the "Griffin Mill" will produce a larger amount of finer pulp at less cost than any other stamp or pulverizer made.

Let us send you a free copy of our illustrated pamphlet, which will tell you all about the Mill and bring to you other evidence of its great achievements.

THE PACIFIC AMALGAMATOR

MILL OR PLACER.
A Guarantee With Each Machine.
This machine is the finest gold saver for both placer mines and quartz mills. No other plate necessary in mills where the Pacific Amalgamator is used. It is constructed almost entirely of metal; it can be transported on pack train. Possesses a large amount of silvered amalgamating plate surface. No scouring of amalgam. Any ordinary amalgamator can operate the machine with good success. Send for catalogue.

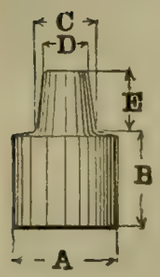
1607-8 Manhattan Building, Chicago, Illinois.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.



KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

MINERS, ATTENTION!

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

28,539.—DESIGN FOR BEER KEG GUARD—A. H. Schram, Oregon City, Or.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PREPAYMENT ATTACHMENT FOR METERS.—Hugh W. Williams, San Leandro, Cal. No. 575,672. Dated Jan. 19, 1897. This invention relates to improvements in mechanism and construction of attachments for meters whereby the introduction of a coin of given value into the apparatus sets free a mechanism which will operate until an amount of gas has passed through the meter equal to the value of the coin which has been deposited. It consists essentially in the combination of a normally closed valve for controlling the meter connection, a means dependent upon the deposit of a coin for opening the valve, means for holding the valve open and permitting it to close at the expiration of a given time, comprising a rotatable screw, a lever connected with the valve, a slidable finger adapted to engage the screw and hold the lever and maintain the valve open during the engagement and to allow the valve to close when the engagement terminates by the rotation of the screw. In conjunction with this mechanism is an indicator operated by the sliding of the screw and a plurality of distinct scales over which the indicator plays so that the sliding movement of the screw may be varied in accordance with the correspondence of its sections with the distinct scales.

Tintic Mining District, UTAH.

The Tintic Mining District lies eighty-five miles south of Salt Lake City on the Rio Grande Western Railway, and is, as shown by the records of 1895 and so far in the present year, the greatest mineral producing district in Utah.

The names of the great bonanzas of Tintic, the Mammoth, Centennial-Eureka, Bullion-Beck, Eureka Hill and Gemini are recognized everywhere that the mining industry is known. The four former have each a record exceeding $1,000,000 in dividends and the latter of over $600,000.

Until within the last two or three years no adequate means of reduction of Tintic ores was in operation in the district and the production of the mines was limited to those ores sufficiently rich to be shipped to the smelters for treatment, but this has been changed by the erection of immense combination and concentration milling plants which can work at a profit those immense deposits of low grade ores which fill all the producing mines of the district. Four of these mills are in active operation, and three others will undoubtedly be erected within the next year.

The ores of Tintic are greatly diversified in character. The principal metals produced are gold, silver, copper and lead. In silver production Tintic leads the State, while in the production of gold it stands second on the list. Beside the big bonanzas above mentioned there are some twenty-five or more properties that now and in the past have been producing mines, and to these may be added a score of others which have paid for their development by their products, and upon which the recent rivival of the mining industry has had the effect of a recommencement of operations.

Tintic has four thriving towns—Eureka, the business center of the district, with a population of 2,500; Mammoth, population 1,000; Robinson and Silver City, 500 each, all of which offer great inducements for investments in a business way.

At the base of the foot hills only a few miles away, is a valley of 25,000 acres of choice fruit and garden lands, watered by the Mt. Nebo Land and Irrigation Company.

As to the future of Tintic, it is no exaggeration to say that it possesses the brightest prospects of any mining district in Utah, and offers to the prospective inventor opportunities which cannot be excelled.

The Rio Grande Western Railway has a double daily train service between Salt Lake City and the Tintic Mining District. For further particulars apply to F. A. WADLEIGH, General Passenger Agent, Salt Lake City.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 28, 1897.

Trade continues to steadily improve. While the buying is largely of a hand-to-mouth character, yet it is enlarging—that is, more dealers come in daily, which makes each week's aggregate sales show an increase over preceding. If it was not for tariff tinkering, there would be a decided revival in business; but the uncertainty as to the import duties on foreign products, raw and manufactured, creates a feeling of uncertainty and more or less uneasiness. It looks now as if by the close of February the new bill will have been so far formulated as to give some degree of assurance as to what can be expected, and, if this proves correct, then large handlers of goods and all kinds of manufacturers can operate with more confidence, knowing that, for four years at least, the tariff question will be out of the way. A tour among the manufacturers shows that the majority are fairly busy for the season of the year. They speak quite hopefully of the future, particularly manufacturers of mining machinery and farm implements. This hopeful feeling is created by authentic reports that there will be more activity in gold and copper mining than has before been known on this coast, and this will call for machinery, while large crop prospects makes it quite certain that there will be more inquiry for farm implements.

In the local money market there is continued ease with an increasing call for first-class paper. The large accumulation of idle money in the banks and a light call for accommodations is doing no little in shading the rate of interest on gilt-edge security. For a better investment many holders of money are turning to the better class of local securities—those that pay dividends. This demand has strengthened the market for them. The East continues to report a plethora of money with the rate of interest for call loans at 1½ per cent per year by trust companies and 2 per cent by banks. The easing of money markets abroad, with the rate of interest in the London open market at 2⅝ per cent, is calculated to work against, for the time being at least, an advance in interest at New York. The exports of products from Atlantic seaports are falling off, but still they are in excess of imports. The balance in this country's favor meets dividend and interest payments abroad and also any selling of American securities held in Europe.

New York Silver Prices.

NEW YORK, Jan. 28.—Following are the closing prices for the week:

	Copper.	Lead.	Iron.	Tin.
Friday	12 00	3 10	11 00@13 00	13 50
Saturday	12 00	3 07½	11 00@13 00	13 60
Monday	12 00	3 05	11 00@13 00	13 65
Tuesday	12 00	3 05	11 00@13 00	13 75
Wednesday	12 00	3 05	11 00@13 00	13 75

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	.15c Prem
New York Telegraphic Transfer	17½c Prem
London Bankers' 60 days	$4.85¼
London Merchants	$4.84½
London Sight Bankers	$4.88¼
Refined Silver, per oz., 1000 fine	64¾
Mexican Dollars	52@52½

SILVER.—The market has shown more strength, with an advance of ¼ cent an ounce on the week's business. This improvement was predicted by the MINING AND SCIENTIFIC PRESS. It ought not to cause surprise if the markets at home and abroad do not move to fully as high figures as ruled last year. The shipments of bullion from New York are quite large, but it seems as though they were all provided for before arrival out, for English markets, instead of declining, are advancing.

MEXICAN DOLLARS.—The Chinese New Year's demand will be over soon, but while it lasts shipments there will be free. Both New York and London report large shipments to meet requirements in China during that holiday season.

ANTIMONY.—Our market is quoted at 7⅛@8c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6½@6⅝c for Hallett's and 6½c for Japanese.

QUICKSILVER.—The demand is good for the season. The shipments by water to Mexico have been light for fully two weeks past. The market is unchanged so far as quotations are concerned.

The market is quoted as follows:

Domestic trade, per flask	36 40

For export, quotations are nominal but less than for home.

COPPER.—The market continues strong, both at home and abroad. The impression prevails that when the spring and summer demand sets in, still better prices will rule. This opinion is grounded on the belief that in this country the consumption will be fully 25 per cent more than last year's, while that in Europe will not show any falling off, with the probability that it will show an increase. With increased consumption and no decided increase in production, sellers will have the advantage.

The local market is quoted as follows:

Ingot, jobbing	14½@—
Ingot, wholesale	13½@—
Sheet copper	17 @—
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

LEAD.—The market has held firm throughout the week.

Pig	— @ 3 75
Bar	— @ 4 00
Sheet	— @ 5 25
Pipe	— @ 4 50

SHOT.—There is a moderate demand.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do. " "	1 45

BORAX.—Shipments to the East are fair. The market is steady.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

TIN.—The markets at the East and abroad are higher, with the tendency to still better figures. It looks as if the speculative pool will be successful in promoting their deal, particularly if silver advances, so that it will cost more to lay down pig from the Straits. Our market is firming up for both plate and pig.

We quote as follows:

Pig, per lb	14½c@ —
Plate, I C coke, heavy, per box	$4 05@ —
" " " light, "	3 95@ —

IRON.—The consumption of pig is said to be increasing. Eastern advices indicate a steadier tone, with the outlook favorable for a large increase in business. It would seem from our advices that the larger producers of Bessemer expect a strong fight. At Milwaukee two iron mining companies held their annual meetings. the Metropolitan, which owns the largest Gogebic range mine, and the Aurora, which olso owns a Gogebic mine that produces ore of the Bessemer grade. In both instances, the reports to the stockholders expressed sanguine views with respect to the season of 1897, although operations in 1896 were highly unsatisfactory, the Metropolitan having shipped less than half as much ore as in 1895. These properties, if any, will be affected by the Carnegie-Rockefeller combination, but the Gogebic miners seem to think that they can hold their own. Both Northwest and Wisconsin share the belief of the mine owners that the coming season will bring improvement and both companies are preparing to handle an increased business.

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50

" jobbing, " "	$2 40
Cut, carloads, " "	....
" jobbing, " "	2 25

POWDER.—The demand is fair.

The market is quoted as follows:

Hercules, No. 1*, per pound	11½c
" No. 2, " "	8½c

Mining Share Market.

SAN FRANCISCO, Jan. 28, 1897.

The market for the north-end shares advanced up to Monday, when Con. Virginia sold at $2.50. While the north-ends advanced the Gold Hill shares declined, but the middle shares firmed up. After the regular session on Monday Con. Virginia began to weaken, causing a decline in the other north-end shares and a weakening in the middle, but the Gold Hill shares held steady. Tuesday and Wednesday there was a further decline in the north-enders, but the Gold Hillers advanced slightly. This see-sawing process is something new to operators, who are somewhat mystified by it, but it looks very much like manipulation without regard to news from the mines. The advance in Con. Virginia was due to reports of a small strike—12 to 18 inches of ore, assaying from $75 to over $200 a ton. It had the effect to make some shorts fill, and, at the same time, bring in some outside buyers. The decline was due to official reports that several weeks' dead work would have to be done before they can find out its extent and value; or, in other words, be developed. The strengthening in the Gold Hill shares towards the close is as much of a mystery as was the decline. The prices ruling for some are too low, considering the work that has been done, and also that is being done, in the mines.

From the Comstock mines official letters do not report any material change in the general situation. The general tenor seems to be favorable, but at the same time it points to time and more money before results can be determined. In Utah work is continued on the same levels as heretofore reported. In Union there seems to be more active work on the 900-foot level. It is east, west and north. From Mexican our advices state that work is still continued on the 1000-foot level. It is to the west. The formation is favorable. In Ophir the work is to the west, both on the 1000-foot and Central tunnel levels. On the latter level in an old west crosscut they have run into some ore going over $24 to the ton. In Con. Virginia they are working on the 1000-foot, 1650-foot and 1750-foot levels. On the 1000-foot level they are running a south drift; on the 1650-foot level they are upraising so as to get at the ore reported on the 1550-foot level. They are working on several floors of the 1750-foot level. They extracted about 19 tons of ore last week assaying a little over $40 to the ton. In Andes repair work will soon be completed. Work is still continued by Best & Belcher and Gould & Curry on their joint east crossdrift from the 800-foot level of the Bonner shaft. The work in Savage ought to begin to attract attention before long. In Hale & Norcross they are still prospecting on the 900-foot level without, so far, showing up any ore. No work is being done by Chollar, but in Potosi work has been done on the 450-foot level toward the Bullion line. It is in the west. Bullion is still running a north drift. They are still working to the west in Alpha on the 500-foot level. From the Gold Hill mines official letters report that they are still pushing, but slowly, the west crossdrift. No work is being done by Challenge. A few tons of ore are being raised each week by Confidence. Preparatory work is being done by Overman for more extensive exploiting work on the 1100-foot level. They raise a few tons of ore each week. It is reported that work will be resumed before long by Caledonia. In Alta they are in vein matter carrying stringers of quartz going from $9 to $22 a ton.

Advices from the Brunswick lode are to the effect that work is being done on the 300-foot level of Best & Belcher and Gould & Curry; they are running a south drift and also an east crossdrift. The work in Savage is the same as heretofore reported. Chollar raised last week 70 tons of ore, assaying, by samples, nearly $35 in gold and a little over 22 ounces of silver per ton. The clean-up from 189 tons milled returned two bars of bullion, valued at $8221. They are working on the 200-foot, 300-foot, 400-foot and 500-foot levels in the same directions as before reported. In Occidental they are working on the same levels reported last week. There has been no change in the formation of the ground, but this is likely to be changed any day for the better, as the work is said to be in this direction.

The following illustrates the changes of the week:

Light requires eight minutes and eighteen seconds to pass from the sun to the earth when at its mean distance; therefore, when we look at the sun we see him, not where he actually is, but where he was about eight minutes and eighteen seconds ago; his true place is then always in advance of his apparent place.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

Commercial Paragraphs.

J. GEO. LEYNER, machinist of Denver, has recently enlarged his facilities for business.

FLINT & LOMAN, electricians of Denver, have just built a 12 V., 250-ampere dynamo for the Denver Engineering Works Company, designed for a gold-saving process. It is built with no insulated wire on armature.

THE Risdon Iron Works of San Francisco have closed a contract with the French Flagstaff Mining Company, of Baker City, Oregon, to furnish a 10-stamp mill, Corliss engine, Johnson concentrators and other mining machinery. The mill will be equipped with all the latest improvements and will be delivered in Baker City in about four weeks. The Risdon will furnish for this mill their well-known and celebrated shoes and dies, made of hammered steel, and it will also contain other special features that will go to make up a very complete and first-class mill. In short, it will be a similar mill to that of the Bonanza mine of Clifford, this county, of which Albert Geiser is the manager.—Baker City Democrat.

THE contract for the electrical utilization of the Falls of St. Anthony, at Minneapolis, has been awarded to the General Electric Company. The St. Anthony Water Power Company and the Pillsbury flour mills and elevator lines were merged in the Pillsbury-Washburn Flour Mills Company, which controlled not only most of the developed water power of the falls, but also the undeveloped water power below the falls. A dam to utilize this power was constructed, and the total available is calculated at 10,000-horse power. The water will pass through turbines, seven of which, each of 1000-horse power capacity, will form the initial hydraulic equipment. The electrical equipment will consist of a plant comprising both direct current railway apparatus for the needs of Minneapolis, and three-phase apparatus for transmission of part of the power to St. Paul, ten miles distant.

THE Rocky Mountain Smelting Company has been incorporated in Colorado, the directors and incorporators being Chas. Foster of Fostoria, Ohio; Wilbur K. Johnson, Jas. B. Orman, John Coon, Harry M. Claffin. The officers are: Chas. Foster, president; William E. Johnson, vice-president; William Kopfer, secretary, and Geo. E. Ross-Lewin, treasurer. The capital stock is $750,000. The site selected for the building of a smelter is Florence, Colo., which possesses the advantages of cheap coal near at hand, abundance of fuel oil, and which is situate less than forty miles from the Cripple Creek mining district. The chief promoters of the enterprise are W. E. and W. K. Johnson, who built the Florence and Cripple Creek railroad. The new smelter, it is understood, will be built expressly with the view of treating Cripple Creek low-grade ores, in which the best known methods will be employed. Johnson Bros. and associates are likewise engaged in building a railroad from Florence to Silver Cliff, which will make large ore shipments from the latter point to Florence possible.

British Columbia.

W. J. R. COWELL, B.A., F.G.S., Mining Engineer,

Reports on mines, designs and superintends the erection of mining and milling machinery; makes analyses of ores, metals, soils, etc.; arranges for mill tests, and selects suitable processes for the treatment of ores. Correspondence invited. Address W. J. R. COWELL, Victoria, B. C.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

WANTED.—Foreman to run a copper blast furnace, oxidized ores, in West Australia. Salary $175. Expenses out paid. One year engagement. Address ALFRED ROPP, Selby Smelting Works, Selby, Cal.

Assessment Notices.

HARTMANN MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Chili Gulch Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of December 1896, an assessment (No. 1) of 5 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 46, No. 4 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of February, 1897, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 23d day of February, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
G. W. PEER, Secretary.

Office—Room 46 No. 4 Montgomery street, San Francisco, California.

MINERAL HILL MINING AND SMELTING CO.—Location of principal place of business, San Francisco, California; location of works, Spenceville, Nevada County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of January, 1897, an assessment (No. 1) of five cents (5c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 210 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 25th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. PEACH, Secretary.

Office—210 Sansome street, San Francisco, California. Office hours from 1 to 3 o'clock P. M.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of January, 1897, an assessment (No. 5) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 8th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. PEACH, Secretary.

Office—237 12th street, San Francisco, California. Office hours from 4 to 6 o'clock P. M.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 13th day of January, 1897, an assessment (No. 5) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 25th day of January, 1897, it was resolved that any stock upon which the assessment shall remain unpaid on the 24th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 21st day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of January, 1897, an assessment (No. 61) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 23d day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
M. JAFFE, Secretary.

The California

— THE CELEBRATED —

HAMMERED STEEL SHOES AND DIES.

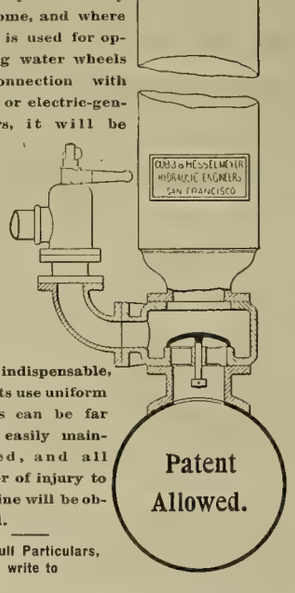
Warranted Not To Clip Off or Batter Up. A HOME PRODUCTION.

Also, Best Refined Cast Tool Steel, Well Bit Steel, Heavy and Light Iron and Steel Forgings of All Descriptions.

PRICES UPON APPLICATION.

GEO. W. PENNINGTON & SONS, 218 and 220 Folsom Street, SAN FRANCISCO, CAL.

'49 DIGGIN'S.



155 acres of virgin ground on the famous Columbia channel. No "cap," all pay gravel. Free water and room to store debris. A hydraulic proposition. Title, U. S. Patent.

QUARTZ MINES: 14 inches of $20 ore to 30 feet of $10 ore. All at the miners' prices.

Jan. 25, '97. E. H. SCHAEFFLE, Murphys, Cal.

APPARATUS
—FOR—
Regulating Pressures
—IN—
PIPE LINES

By the use of this device, the fluctuations of pressure resulting from shock or water ram may be entirely overcome, and where water is used for operating water wheels in connection with hoists or electric-generators, it will be found indispensable, as by its use uniform speeds can be far more easily maintained, and all danger of injury to pipe line will be obviated.

Assaying Gold
.....AND.....
Silver Ores.

A Standard Work.

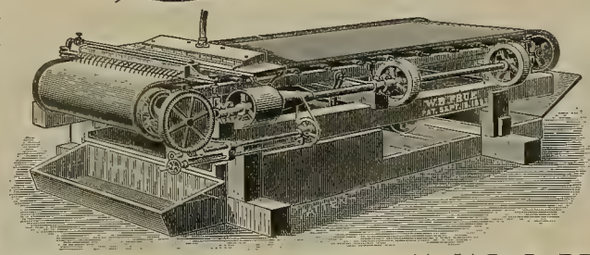
THIRD EDITION JUST OUT.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.



The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

The Tomboy Mine.

The sale of a controlling interest in the Tomboy mine of Telluride, San Miguel county, Colorado, to the Exploration Company of London, at the rate of about $1,500,000 for the whole property, affords an illustration of the great profits in legitimate mining conducted on business lines. The property, when purchased by the people who have lately sold it, was known to be of value, but required capital for its development. It was a safe business proposition. They paid $105,000 for it in June, 1894, and, after putting considerable money in improvements, up to January 1, 1897, have paid in dividends $1,000,000. This, added to the difference between the purchasing and selling price, leaves a profit of nearly $2,500,000.

While there are large reserves, there is need for considerable further expenditure in improvements to take the best advantages of the possibilities in the mine. The Exploration Company purchased 51 per cent of the capital stock, and this gives them control. In order to increase the proportion of profits from the ore reserves in sight, further large expenditures are about to be made. Some $300,000 will be expended in increasing the milling capacity and in improving the facilities for taking out ore. Careful examinations have been made of the property with a view to determining not its present value so much as how the ores in sight or in prospect may be most economically worked, so that during the life of the mine as large a proportion of profits as possible may be made.

It is to be observed that the Exploration Company and other English investors during the past two years have turned their attention in the United States rather to old and well-developed properties which, with some improvements in the methods of working, will become worth more than under their old management. Such has been the case with the Anaconda in Montana, the Helena & Frisco in Idaho and the Tomboy in Colorado. Good prices have been paid by the English for all these properties, and yet they have made, or will make, them more valuable by better development and management at the outset than the previous owners could afford. This has been the policy of this particular English syndicate since its organization. Wiser than most English concerns, they employ agents and experts acquainted with local conditions and, instead of sending out foreign engineers, most of the men they have placed in charge of their properties in America, for which they have paid within the past two years nearly $50,000,000, are Americans.

On this page is an illustration from the Telluride, Col., *Journal*, of the Tomboy mill which, as at present equipped, can treat 225 tons of ore daily. It is understood that the capacity will be doubled and other improvements made and development work done that will involve an expenditure of some $300,000.

A crosscut tunnel from the mill level to the mines has been started, and, when completed, will, at a distance of 1900 feet from the face, tap the vein at a depth of 400 feet below the present workings. The total amount of development work in the way of tunnels, drifts and shafts done on the property up to the present time does not exceed 4000 feet, which is very little considering the output and the value of the property. The number of men employed under the system of the old management is about 210.

THE TOMBOY MILL, TELLURIDE, COLORADO.

A BILL, drafted by Hon. Tirey L. Ford, has been introduced in the Legislature as a substitute for the first proposed bill appropriating $250,000. The principal changes made are as to the power of the State Commissioner, who is made only a ministerial officer, and the power of determining as to the work is left to the Board of Examiners.

Book Reviews; Catalogues, Etc.; Coast Industrial Notes; Obituary; Recently Declared Mining Dividends; Personal, 119. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 127.

The Coming Rush to Alaska.

There promises to be more disappointed gold seekers returning from Alaska at the end of the coming season than last. They will have no reason to abuse the country nor claim that it is not a splendid field for men of small capital combined with some experience. Yet they will; for those who will be disappointed will be men who go unprepared and lured into the country by the visionary promises of transportation companies and others interested. A bureau of information—so it is called—has been established on Puget Sound, which is advertising over a large part of the United States fabulous stories of the wealth of Alaska. They have distributed posters in the depots along the Northern transcontinental lines and railways throughout Minnesota, Iowa, and parts of Missouri, Wisconsin and Illinois, and are extending the work into other States.

They are wise enough to do their work in those parts of the country where there are few miners and papers interested in that industry to prevent those from going who have neither experience nor sufficient means to carry themselves through in case of failure.

Of the presence of great wealth in Alaska there can be little question, but most of the men who will find it will be miners. There are men who have had little or no experience in mining who will do well, because they will go prepared to stay until they learn or join fortunes with men of more experience. No man should go to the Yukon placers unless he is prepared to stay for at least two seasons.

In the Yukon country rich placers have been discovered, but most of those lying along the creeks and easily accessible have been taken up or worked out, and most of the newcomers must go to the upper benches, where the ground must be thawed out by fire or with running water before it can be loosened. The mining season is very short—not over four or five months. As to quartz mining, none may hope to do much in that direction, further than making discoveries, without large capital, for the cost of carrying in the necessary machinery is very heavy.

Professor Christy's Article.

In this issue of the MINING AND SCIENTIFIC PRESS is published the conclusion of the very valuable paper "Solution and Precipitation of the Cyanide of Gold," by Professor S. B. Christy, of the College of Mines of the University of California. The work done by Professor Christy is valuable and timely. It is too often that men employed in scientific work devote their time rather to explaining how things have been done and going over old ground than in doing timely work that will be of immediate practical value. Through just such work as this of Prof. Christy can the University best win the confidence and support of the public.

In this paper Prof. Christy does not go beyond what he has proved in his own laboratories. In other words, he has given a solid basis for others to work on. Most of the articles heretofore written by able men on the subject have contained much of a suggestive nature rather than positive conclusions.

Power of Directors of Mining Corporations.

There has been introduced in the Assemby of California, by its Committee on Mines and Mining, a bill to amend the act of April 23, 1880, for the protection of stockholders in mining corporations so as to provide that it shall not be lawful for the directors of any mining corporation to sell, lease or mortgage or otherwise dispose of any part of the mining ground held by the corporation, or to purchase or obtain in any way (except by location) any additional mining ground without the consent of a majority of the stockholders.

In the State of Washington the law sets forth as follows:

"The corporate powers of a corporation shall be exercised by a board of not less than two trustees. A majority of the trustees shall form a board for the transaction of business; and every decision of a majority of the persons duly assembled as a board shall be valid as a corporate act."

The Spokane *Spokesman-Review* commenting on this says:

"If it be true, as contended, that the board of trustees may sell a mine or mines without the assent of the shareholders, it would be possible, under the law for three trustees in a board of nine to sell all the property of a corporation. Under this construction of the law, five trustees would constitute a quorum, and three would be a majority and could transfer the property."

The Oregon law in this respect is almost identical and Judge Deady of the United States District Court has ruled, in a case involving the right of the trustees of the Oregonian Railway Company, to make a lease practically amounting to a sale, as follows:

"The corporate powers of an incorporation formed under the laws of this State are vested in the directors, and the validity of their acts is not affected by the assent or dissent of the shareholders, and the powers of the latter are limited to the matters which concern the internal organization of the corporation."

Miners' Rights of Way.

There has been introduced in the California Legislature an act providing that every miner shall have the right of way across any and all mining claims, for the purpose of hauling quartz and all mineral-bearing ores, wood, timber and all supplies for mining purposes to and from his claim. This is in its general intent a good bill and should pass, provided some restriction is made as to payment of any actual damage.

No steps seem, however, to have been taken by the representatives of the mining districts toward securing the passage of a bill much in the same direction, but of far greater importance—a bill providing for a constitutional amendment that will make mining a public use and enable the owner of a mining claim to maintain proceedings in condemnation, in order to run tunnels and secure other rights of way upon paying just compensation for any damages that may accrue.

The adoption of such an amendment to the constitution can work no one a hardship, and it is not likely to be opposed by any except those harpies who make it a business to locate around valuable claims for the purpose of levying blackmail. In many districts in California are men whose main occupation is the location and relocation without assessment work of claims that they have no intention of working and that are valueless, except in so far as they may block some good mines' right of way. But aside from these cases there are many good reasons for the passage of the bill, many of which have been touched upon in previous issues of this paper.

Testimony of Experts.

Expert testimony in lawsuits in this country of doctors of medicine, civil and mining engineers and others, even when given by men whose reputation places them above reproach, is always looked upon much as the special plea of an attorney for one side—with suspicion. While in many cases it will be admitted that "nothing but the truth" has been told, "the whole truth" has not. The expert is employed by one side. The judge or the jury look upon his evidence as they do upon the speech of the counsel for the same side. This has done much to bring expert testimony into disrepute and does the experts themselves no good, as far as their reputations are concerned.

In this connection the following letter received from Prof. Frederic A. C. Perrine, D. Sc. of Leland Stanford Jr. University, is of interest and should be of value in inducing action:

"In the October *Atlantic* Professor John Trowbridge has published an article on the influence of expert testimony before the courts in its bearing upon the independence of experts and the justice meted by the courts, which is particularly important to mining engineers having many suits involving scientific opinion.

"Professor Trowbridge shows that in spite of the desire of the expert to give unbiased testimony the lawyers, by demanding uncategorical answers, may transform his opinion into something apparently entirely favorable to their case. Such uncategorical answers, being impossible as exact replies, are generally impossible to questions involving scientific and engineering experience.

"The remedy proposed by Professor Trowbridge has been often before indicated, and the method of obtaining expert testimony which he advocates is already in satisfactory use by the British admiralty courts and the German tribunals for deciding on patent rights. He proposes that no expert testimony should be allowed in any case except such as would be called by the courts themselves and the expense charged to the case exactly as are the wages of the judge and jury. Should this be done, the expert witnesses would be able to give their true opinions and place the facts before the courts in a clear light, which in the present system is not possible, both on account of the fact that the expert necessarily tends to further the side by which he is retained, and that the judges are unable to determine when a categorical answer should be necessary.

"In every court of the land this abuse has become recognized, until we find many judges deciding according to their own personal prejudices, without reference to the expert opinions, since these opinions seem to them to be distinctly biased, and because these experts are not scientific men telling 'the whole truth and nothing but the truth,' but are quasi advocates, endeavoring to the best of their ability to earn the fees paid them.

"The miners of California are endeavoring to obtain many modifications in the mining laws which will obtain for them greater justice in decisions involving mine rights, but it seems that no clear rights can ever be established by any modifications of the laws until the adjudication of the laws enacted be rendered in every case necessarily according to justice and not prejudice. Judges and juries may generally be relied upon to decide correctly concerning points of law or equity with which they are already familiar, but where a particular knowledge is necessary for a correct decision, and this knowledge is only within the range of an expert's information, all others are confused by the testimony given and a wide field left open for particular prejudices in legal decisions. This should be corrected, and it seems possible to solve the difficulty only by arranging for testimony on such disputed points which shall be clearly above suspicion; but we cannot expect to obtain such testimony under the present method of procedure nor will the procedure be changed until an industry directly affected will attempt to have the necessary laws passed. Should the miners or any other body of men undertake the passage of these laws, there is no reason to expect determined opposition from any quarter whatever, since their enactment would be a benefit to all parties concerned in litigation involving decisions dependent upon the information for which experts are generally called."

Concentrates.

OVER half the silver produced in Arizona last year came from the county of Mohave.

THE total capital stock of thirteen mining companies formed in British Columbia last week was $10,300,000.

THE contractors building the ditch for the Gold Creek, Nevada, Placer Mining Company have 200 men on their pay-roll.

F. B. TURNER of Butte, in the interest of Montana capital, has secured a site in Rossland, B. C., for the erection of a custom sampling plant.

BUTTE, Mont., is soon to have another smelter plant, to be constructed by the Occidental Smelting Company, composed of Pennsylvania and London capital.

FOR the month of January, 1897, San Francisco corporations paid a total of $1,061,851 in dividends, against a total of $1,120,392 for the corresponding month in 1896.

IN the Panamint district, east of Randsburg, Cal., a strike of rich ore is reported as made in the old Amargosa. Considerable prospecting is being done in the district.

THERE has been passed by the Senate a bill authorizing the entry and patenting of lands containing petroleum and other mineral oils under the placer mining laws of the United States.

THE Hidden Treasure Company, owners of the Dam drift mine at Centerville, Placer county, Cal., propose to put in an electric plant, with which the cars will be run in and out of the mine.

COL. W. W. D. TURNER of Spokane, one of the owners of the Le Roi mine at Rossland, British Columbia, is authority for the statement that they have been offered $4,000,000 for the mine and have refused it.

DURING the first three weeks of January eight mines at Rossland, B. C., shipped to smelters 3585 tons of ore, and in the third week of January from ten mines in the Slocan 554 tons were received at Kaslo.

THE citizens of Rossland, British Columbia, are making a determined effort to have the town incorporated, and it is probable that a bill giving them power will be passed by the provincial legislature this session.

J. A. YERINGTON has received an order from an Eastern syndicate to ship a carload of silicon from his mine near the Queen station in Nevada. If this test proves satisfactory, regular shipments will be made hereafter.

THE first annual report of the Golden Cache Mines Company of Vancouver, B. C., shows that considerable work has been done in the way of development on their properties at Lillooet and a 10-stamp mill has been contracted for.

A STRIKE of rich quartz in San Gabriel canyon, in Los Angeles county, Cal., is reported. For many years San Gabriel canyon has been prospected and worked. Years ago the mountains were known to contain quartz leads.

AN onyx factory is to be erected at Phœnix, Arizona, by people who have purchased some deposits of that mineral near there. At the Cave creek mine there is at present 700 tons of onyx on the dump and 1000 more in sight.

ACCORDING to a Placer county paper, the Anaconda Company of Montana have, through their agents, lately purchased from E. M. Smith of Coloma a tract of land lying between Pilot hill and Uniontown, El Dorado county, to mine for copper.

THE ten-ton cages for the compartment shafts of the Calumet & Hecla, Mich., mine are building. The two 4000 H. P. engines are designed to hoist the ten-ton cages at an average speed of 3000 feet per minute, or thirty-five miles an hour.

A DISCOVERY has been made of a ledge of onyx on the Bruneau river in Elko county, Nevada. There are two varieties—pearl and yellow. It is claimed that in the past Indians obtained their onyx for their ornaments from these deposits.

THERE is a proposition on foot to establish at Trail, B. C., a large gas plant, with the purpose of furnishing gas not only for lighting purposes, but also for fuel in the mines, the claim being made that this can be done more cheaply than the cost of wood.

A MILL and cyanide plant are being erected by the South Australian government for the treatment of gold ores in the Macdonnell range, a new district 1000 miles north of Adelaide, where good prospects have been found, but no large ore bodies developed.

T. S. TALIAFERO of Green River, Wyoming, has interested Chicago capital in the proposed erection of a soda evaporating plant. The plant will make a specialty of the manufacture of caustic soda, the water of the Green River well yielding 10 per cent of this variety.

ACCORDING to *l'Echo des Mines* of Paris, small veins carrying platinum have recently been found in syenitic rocks in Hungary. Platinum has also been found in veins of manganese ore existing in altered or decomposed syenites near Santa Rosa de Osos in Colombia.

NO PARTS of California are provided with worse roads than the mining districts, and nothing would tend more toward the development of mining than good roads. Senator Gleaves of Shasta proposes a bill providing for a system of State highways throughout the commonwealth.

THE Fortuna and other mines in Nevada county, Cal., have been purchased by the Summit Mining Company, owners of the Dannebroge, in Brown's Valley. The Fortuna was owned many years ago by the late ex-Congressman Frank Page. The new owners expect to put up a mill shortly.

AT present all land office business for Randsburg and the neighboring districts in Kern county, Cal., must be transacted at Independence, Inyo county, which is 150 miles away by stage. Steps are being taken to have these districts transferred to the jurisdiction of the Los Angeles land office.

THE dividends paid by the mines of the Rand, South Africa, in 1895 amounted to £2,518,418, and in 1896 to only £1,372,912; yet there was a slight increase in 1896 in the total output. In 1896 the Robinson paid £300,000 in dividends, the Ferreira £247,500, the Langlaate £141,000, and the Crown Reef £142,000.

THE Edna mine, on Spring Gulch, in Calaveras county, Cal., was sold last week to W. G. Adams, superintendent of the Bellweather mine at Jackson, who bought it for J. W. Hepburn, City Assessor of Chicago, for $85,000. It is proposed to enlarge the shaft to three compartments and sink 1000 feet.

DIRECTOR WALCOTT of the United States Geological Survey, in his report on the Yukon district, says that it has been found that not alone on the placers does the future of the Yukon placers rest. Running west of north through the valley is a broad continuous belt of quartz which will yield gold, silver, copper and lead. While the principal zone of ore is largely low grade, there are many indications of rich placers. The gold-bearing rock is of the same general quality as that found in the Treadwell mine.

IN the California Legislature last Wednesday the Committee on Mines and Mining reported as a substitute for the Senate Mining Debris Bill, the act upon the same subject drawn by the State Miners' Association. It carries an appropriation of $250,000, and was referred to the Finance Committee.

A DISPATCH from San Diego., Cal., announces that the Helvetia gold mine, one of the largest in the Julian district, and owned by W. H. Holcomb and others, has been bonded for $40,000 to a party of Denver capitalists. There is being driven a 1200-foot tunnel to tap a ledge 700 feet below the surface.

IN the Slocan district, in British Columbia, there are fifty mines from which ore is being shipped, and it is claimed that before the end of the year this number will be nearly doubled. Had it not been for the competition of railroads, that induced the building of branches, this district could not have made much of a showing.

IN British Guiana the sugar industry is declining, and the attention of the government and the people is being turned to gold mining more than ever. Some important discoveries have attracted the attention of the leading spirits of the colony. It is probable that, with the settling of the dispute with Venezuela, there will be considerable activity.

THE Fitzhugh Electric Power Company is about to begin the construction of an electric-power plant on the Stanislaus river near Tuttletown, Cal. The company proposes to install the plant with 3000 horse power, allowing a loss of 50 per cent, leaving 1500 horse power to deliver to the mines along the mother lode from Fourth Crossing in Calaveras county.

A MEMBER of the United States Geological Survey, who took part in the recent examination of the copper belt at Butte, Montana, writes: "It is still an open question with us as to whether the amount of copper washed away in the water from the mines of Butte district is not equal in value to the total output of all the mines of the district, if it could be saved."

ACCORDING to the official returns the gold yield of Victoria for the past year amounted to 805,807 ounces, of the value of £3,220,348, being an increase of 65,000 ounces. The yield up to date amounts to 60,991,408 ounces, of the value of £243,865,632. The gold yield of New Zealand for the quarter ending December amounted to 67,000 ounces, a decrease of 24,000 ounces.

THE Public Lands Committee of the House has received a petition from 350 citizens of Tuolumne county, asking that certain lands in the northern section of Yosemite Park be separated from the reservation, on the ground that the territory in question is too remote from the park to be of service as a pleasure ground, and, by reason of its location, is inaccessible in time of high water.

IN South Africa, through an arrangement made by Cecil Rhodes, the Cape government secures exclusive control of the whole Robinson railway system, with the exception of the Beira line, and there will be an extension built from Buluwayo to Salisbury. This will break down the barriers put up by the Boer government over the Transvaal system, it is claimed, in favor of the Rand.

LAST week Charles D. Lane and A. G. Campbell were paid $250,000 for their seventeen mines in Silver Bow Basin, Alaska, by Captain Thomas Mein, Robert Duncan Jr. and their associates. The corporation has been reorganized and will be known as the Alaska-Juneau Gold Mining Company; president, Henry Pichoir; vice-president, Thomas Mein; directors, W. W. Mein, Robert Duncan Jr. and Joseph Mooser.

THE Bank of England holds £34,518,092 gold, against £45,531,811 last year; the Bank of France, £76,333,590 gold and £49,044,797 silver, against £77,373,870 gold and £49,332,723 silver; the Bank of Germany £26,821,700 gold and £13,407,350 silver, against £29,116,190 gold and £14,340,810 silver, and the Bank of Austria-Hungary, £30,214,000 gold and £12,574,000 silver, against £34,409,000 gold and £12,660,000 silver.

D. C. LANE of Pomona has arranged to convey his mining interests in Inyo county, Cal., consisting of the Last Chance No. 2, Southwest and Sunshine mines, to a syndicate of Pomona capitalists for $80,000. This group adjoins the old silver mines of Darwin. The new syndicate will at once put up a 10-stamp mill, and will develop on a more extensive scale than before.

THREE transcontinental railroads are bidding for the branches leading into the mining country of British Columbia. These are the Canadian Pacific, the Northern Pacific and the Great Northern. The railroads that they want are the Spokane Falls & Northern, running from Spokane to Northport; the Columbia & Red Mountain, running from Northport to Rossland, and the Nelson & Fort Sheppard, running from Northport to Nelson, B. C.

AT Keswick, Shasta county, Cal., the Mountain Copper Company, Limited, are about to construct, under the direction of H. A. Keller, 100 additional stall roasters and two smelting furnaces. The excavation for the accommodation of the roasters is now completed and the quarry men are at work getting out rock for their construction. When they are erected the company will have four furnaces, each over 360 tons capacity every twenty-four hours.

THE Butte *Inter-Mountain* stated a short time ago that over $2,000,000 went to waste in smelter smoke each year in Butte. Now some chemists have under contemplation a plan to convert the fumes of the smelters into sulphur and begin the manufacture of chemicals in which sulphur forms the principal ingredient. All the sulphur used in the United States at the present time is imported, and during the present winter the price of this product has almost doubled.

THE December yield of gold in the Rand, South Africa, was 206,000 ounces—the second best monthly record. Now, it would appear that an effort is to be made to stir up more interest in London in the mines. John Hays Hammond goes down in a few days for the Consolidated Gold Fields, Limited, and it is given out that his purpose is to try to make improvements in the policy of working the mines that will increase the output and revive interest in them in the London market.

THE manager's report of the work done by the Horsefly Gold Mining Company of this city in its properties on Horsefly river, in the Cariboo district, B. C., shows that a ditch five miles in length, eight feet wide on top and four on the bottom and three feet deep has been dug, 15,000 feet of pipe, tools, giants, etc., have been taken in, roads and houses built and the mine put in shape to begin piping in the spring at a cost of $100,032.55, in addition to $80,000 paid for property and leases.

THERE were registered in 1896 in London 857 mining companies, with a total capitalization of £94,419,194, against 961 in 1895, with a total capitalization of £107,387,241. The decrease was due entirely to the cessation of the forming of South African companies. In companies formed to work mines in other parts of the world there was an increase. In 1895 there were formed 338 new South African companies, with a combined capital of £46,087,485, while the number in 1896 was only 113, with a combined capital of £18,520,064.

SAYS the Grass Valley, Cal., *Telegraph:* "Assemblyman Wm. S. Robinson will withdraw the mining bill introduced by him several days since, wherein it would require a bond of $5000 to be deposited by parties bonding mines, or, failing to do so, they would be fined $1000. Mr. Robinson introduced the bill in all candor, fully believing that it would meet with the approval of his constituents. As soon as he found out that the measure was strongly opposed by many who were engaged in mining, he had no further disposition to press the matter."

THE Colorado *Mining Investor* says that there is considerable experimenting with the mill at the Independence mine. It is now stated that W. S. Stratton, the owner, has about decided to take out the machinery and substitute a cyanide plant instead. It is claimed that the immense dump at the mine can all practically be made to pay a profit by the cyanide process. The mill was erected at an enormous expense and operated under a new process, known only to the discoverer and Stratton. The latter furnished the money to test its adaptability.

THE statutory meeting of the shareholders in the Jackson Exploration and Development Company, Limited, was held in London last month, when the chairman stated that the No. 1 shaft in the Amador mine was down 368 feet. A small chute worth 1 ounce 10 dwts. had been developed, but it was considered that the reef they were searching for, and which was known to be rich, would not be found until a depth of 500 feet was attained. The total cost per foot of the driving had been $23, but the manager thought he would be able to reduce the amount in the future.

LAST Monday the Butte and Boston Mining Company's property was sold by Receiver John F. Forbis in Butte. The property was bought by E. Rollins Morse, chairman of the Butte and Boston reorganization committee, for $2,550,000, but the bid was $50,000, the difference being represented by the incumbrances on the property. Immediately after the the equity redemption sale, J. O. Bender, special master, sold a portion of the property to satisfy a $1,000,000 mortgage, held by the Massachusetts Loan and Trust Company. Morse also bid it in for the account of the mortgage. This $1,000,000, however, is a part of the $2,550,000 included in the first sale.

A STOCKMAN has discovered a large body of gilsonite near Price, Utah, which is said to be 35 feet thick. The gilsonite deposits in the Uncompaghre reservation in the Uintah basin have attracted the attention of prospectors and capitalists for some time and have been the cause of special mention in a presidential message to Congress. Vertical cracks, varying in length from a few feet to several miles and in width from a few inches to 18 or 20 feet, are filled with this mineral. Six of these large veins, as they may be called, are estimated to contain 24,000,000 tons of gilsonite. It is used for many purposes, from paving to varnish for certain metals, and will not crack with ordinary bending.

THE Kootenay Water Supply Company of Waneta, British Columbia, and the Kootenay Hydraulic Mining Company, both owned by New York capitalists, have united for the purpose of erecting an electric plant for generating power for the district. The latter company have a large hydraulic plant on the Pend d'Oreille with water power which was used to work gold-bearing gravel banks near the boundary, but the gold was flaky and could not be saved by that method. Another system of saving the gold will be employed this summer. The water power held and owned by these companies will develop over 10,000 horse power, and the project now is to utilize this power in Rossland and other mining camps.

AT a meeting of the miners of Riverside county at Perris, Cal., last Saturday, the following resolutions were adopted: That our representatives in Congress be instructed to use every effort to secure the passage of the mineral lands bill at the present session of Congress; that our representatives in Congress be instructed to support and urge the adoption of the resolution recently introduced by Senator Perkins, looking toward the establishment of a Secretaryship of Mines and Minerals; that our representatives in Congress be requested to support the passage of an amendment to section 2326 of the Revised Statutes of the United States, defining what shall constitute a placer claim; that we are heartily in sympathy with the purpose and objects of the California State Miners' Association, and desire to co-operate therewith; that the district recorder of every organized mining district within the State be required by law to file with the county recorder a transcript of all notices of location recorded by him every three months.

NUMEROUS smelters are "proposed" here and there as though such a plant involved no more than the building of a 5-stamp mill. The proposers and projectors of many such ideas would do well to read the annual report of the directors of the Anaconda Copper Mining Co. of Montana. The directors therein explain an item of $3,609,665 which appears in the balance sheet as "loans" and outstanding accounts. They state that "from the time that the ore from the mines is extracted and delivered to the reduction works an average period of from four to five months elapses before the copper, silver and gold produced are paid for, rendering requisite a capital of over $4,000,000 to carry such products." This concern has a paid up capital of $30,000,000, but finds it necessary to borrow millions more to carry on its operations. Although it has a large refinery of its own, in which it refines half of the products of its smelter, it finds it more advantageous to ship the other half in the shape of matte to Eastern smelters rather than extend its own refining plant. These figures show the large financial resources which any company, proposing to engage in smelting operations on a considerable scale, and on a sound business basis, should possess, and should be remembered when any proposition, which appears to lack such necessary financial strength, is submitted for consideration, especially with a view of getting a subsidy.

The Solution and Precipitation of the Cyanide of Gold.*

NUMBER VIII.—CONCLUDED.

By S. B. CHRISTY, Professor of Mining and Metallurgy, University of California, Berkeley, Cal.

10. The Advantages of Precipitating the Gold by Means of Cuprous Salts.

It must be evident to those who have followed the progressive development of the cyanide process that, as the method is better understood, the constant tendency is towards the use of more and more dilute cyanide solutions. While in the beginning a solution of 1 per cent was used, this was first reduced to one-half, then one-quarter, and finally to one-tenth, and even one-twentieth, of 1 per cent. As the action of the so-called "cyanicides" contained in the ore is better understood and prevented, it seems not unlikely that the strength of the solution in potassium cyanide may be reduced to one one-hundredth of 1 per cent, or even lower. It should be remembered that much of the material treated by this process does not assay over $3 per ton, or only half of one one-thousandth of 1 per cent gold. So that a ton of solution of 0.01 per cent potassium cyanide solution contains thirty times as much cyanide as is needed to dissolve $3 worth of gold in a ton of ore.

The present methods of precipitation, the electrical and the zinc shavings method, both find in these dilute solutions their great difficulty. In the electrical process the resistance of such solutions is something enormous. In the case of the zinc shavings it is practically impossible to precipitate the gold from such a solution unless it contains one or two-tenths per cent free cyanide of potassium. This fact alone prevents the cyanide from being utilized to the best advantage.

In order that the cyanide should be utilized to the full, we should form the maximum of $KAuCy_2$ and leave a minimum of free KCy in the solution. This, as has been pointed out, is fatal to the precipitation of zinc shavings. But it is just here that the cuprous method of precipitation comes into play most efficiently.

In the treatment of such solutions with a bare excess of potassium cyanide, there is no method of precipitation yet invented that can compete with it. In such a case there is not enough cyanide of potassium in the solution to bother about saving it.

The method of procedure would then be as follows: The solution would be made slightly acid by sulphuric or sulphurous acid, as might be most convenient. Then there would be added a copper sulphate solution with common salt, which had been saturated with sulphurous acid. This solution should be added until the filtered solution gives a red precipitate with potassium ferrocyanide. The whole solution should be thoroughly stirred before this end-point is determined. A neat way to determine the end-point is to place a few drops of the stirred mixture on a double layer of fine filter-paper. On removing the upper layer, a drop of ferrocyanide of potassium will give a red precipitate of cuprous ferrocyanide on the wetted spot of the lower layer when the end-point is reached. This method avoids the delay of filtering the solution in the ordinary way. It would, of course, be best to determine the end-point beforehand, with a liter of solution, and then add the copper-salt to the mass of solution, after a preliminary calculation as to how much is required.

The solution should be allowed to stand for at least twelve hours, when it should be filtered. The filtrate should stand another twelve hours to see if any further precipitate forms; or it may be filtered first through CuS, to remove any suspended or dissolved gold, and then through old scrap iron to throw down any copper contents.

For the recovery of the gold from the cuprous aurocyanide Prof. de Wilde suggests three methods as follows:

"First Method.—Roasting in a reverberatory furnace. One obtains thus a residue of gold and of oxide of copper (CuO). This latter is then dissolved in sulphuric acid diluted to 20° Baume (or in dilute nitric or hydrochloric acid), and the gold remains in the residue as pure gold.

"At the same time the sulphate of copper is regenerated, which will serve to precipitate the gold in subsequent operations†, and the same quantity of copper may continue to serve. Owing to the sharpness of the reactions, the loss of copper will be insignificant.

"Second Method.—Solution of the cuprous cyanide in dilute chlorhydric or nitric acid; there remains a residue of aurous cyanide which, after washing and drying, is decomposed by heat and pure gold is left behind.

"Third Method.—The precipitate is heated with 60° Baume sulphuric acid in a porcelain or iron pot; it is entirely decomposed, leaving a residue of pure spongy gold. After cooling water is added, the precious metal is washed by decantation, dried and melted. The copper has been transformed into sulphate.

"The first method appears to me the most rational, the roasting being attempted once or twice a month only. It is an inexpensive operation, and the sulphate of copper is thus regenerated."

In this matter I agree with Prof. de Wilde. After being carefully dried, the conversion of the cyanide takes place very quietly at a low red heat, and the spongy, porous, black residue readily dissolves in the sulphuric acid, leaving the gold very clean. Care should be taken not to alloy the gold and copper by a reducing atmosphere and too much heat.

A fourth method would be to dissolve both gold and copper cyanide in a strong KCy solution, and precipitate pure gold by the dynamo. With less than 2.5 volts and a strong solution of KCy this is possible, the copper remaining in solution.‡ This I have verified. All the objections to electrolysis apply, except that the bulk of the solution would be small, and it would be concentrated.

In many cases it would probably prove more advantageous for the reduction works to ship this precipitate without attempting to reduce it, as the technical skill to do this occasional work is hard to get in mining camps.

The methods here outlined will certainly fail in the hands of those without chemical knowledge and engineering skill, and many unforeseen difficulties will probably have to be overcome before they can be utilized in practice. Nevertheless, I feel very confident that in some of the methods here outlined for the precipitation of gold by means of cuprous salts will be found the missing link in the chain of operations necessary to utilize the extremely dilute solutions of cyanide of potassium, which have been found effective in extracting gold from low-grade ores. If this should prove to be the case, and the usefulness of the method should be extended, particularly in California, my native State, I shall feel amply repaid for this long labor.

III.—THE TREATMENT OF ORES.

I have here reached the limit laid out for myself in the present paper. Still a few words on the application of the process to ores may not be out of place. In the first place, it should be said that the usual extraction from the South African tailings averages only from 60 to 70 per cent. While such results on low-grade products that can be treated in no other manner may be eminently satisfactory, they should be regarded as decidedly unsatisfactory for rich ores and concentrated sulphurets, assaying perhaps $100 per ton or upwards. It is to the treatment of such products, particularly the latter, that I have given the most attention. Although at first I could obtain extractions at most averaging not more than 70 or 80 per cent, I was finally able to reach uniform extractions that were eminently satisfactory with quite a wide range of ores. Thus, with the concentrated sulphurets from the Idaho mine, Grass Valley, assaying $120 per ton, I began with 70 per cent and finished with 98 and 99.45 per cent. With the Alaska-Treadwell concentrates, assaying $50 per ton, I began with 75 per cent extractions, and finished by extracting all but a trace. In a lot of concentrates from the Bald Eagle mine, Alaska, assaying $280 per ton, I was finally able to extract up to 97 per cent. On the other hand, with a lot of sulphurets from the Bay State mine, Amador county, California, assaying $160 per ton, 90 per cent is the best result yet obtained.

Each one of these ores demanded a long and painful study before these results could be obtained with any certainty, and there still remain some difficulties to be overcome before they can be reached on the large scale. Still there seems a strong probability this will be accomplished. And while it is unlikely that the cyanide process will displace any of the standard methods of gold-extraction it will certainly supplement them where they are weak, and will perhaps enable low-grade ores to be worked that will not now pay for chlorination.

I cannot close without a warning to those who expect extravagant results from this method in the hands of persons utterly ignorant of chemistry. No process was ever introduced requiring a more thorough and subtle chemical knowledge, and without it success is absolutely impossible. But engineering skill and experience are also equally indispensable, and success can only follow where these agents cooperate to produce the final result.

*Colorado meeting American Institute of Mining Engineers, Sept., 1896. (Revised Proofs Dec. '96.)

† The sulphate of copper thus regenerated should be crystallized by cooling the solution, and the crystals drained from the adherent acid mother liquor. A solution of sulphate of copper containing a notable quantity of sulphuric acid is not adapted to the precipitation of gold. The mother liquors, after being strengthened by the addition of sulphuric acid, serve very well for the attack of the mixture of oxide of copper and gold.

‡ H. Freudenberg, *Zeitschrift fur Physikalische Chemie*, xii, p. 97.

The Scene of California Mining Before 1849.

Up one of the big canyons in the Santa Monica mountains, a few miles north of the town of Santa Monica, are evidences of mining done fifty years ago or more. It is evident, too, that it was placer gold that they extracted, for the work was considerable and undoubtedly done by large forces of men. These former workings can be traced for more than a mile in one canyon, and through the nicely heaped dumps on either side trees are growing that would square, if sawed, 5 or 6 inches. Many of these trees (oak) are known to be of slow growth, and it is by them that the length of time that has elapsed since the work was done is estimated. These indications of former mining have stimulated prospectors at one time or another for many years to investigate the ground with pick, shovel and pan, but no good ever came of it further than a few "colors" of coarse gold. Some quartz is also found, but of such a low grade, and the vein matter being so small and "pockety," that this, too, was given up, and nothing like steady development of either the placer deposits or quartz leads has ever been prosecuted to any considerable extent.

The proverbial "oldest inhabitant" can throw no light on the subject of by whom these former workings was done, and it is a matter of perplexity wherever the matter is mentioned. That they succeeded in saving a great deal of gold, as evidenced by the amount the channel was worked, no one has a doubt. But where did they come from, and where did they go? are the questions that remain unanswered. There is a beautiful spring flowing from about the center of the old workings, used by those who of late years have tried to unravel the mystery. They have left a rocker there, yet in a good state of preservation, and once in a while one or more old California miners go up and work a spell, never returning with enough gold to reward them for their time and labor. Some think it was done under the direction of the Franciscan Fathers, and they had for their subjects natives, and the gold thus found was conveyed to Old Mexico and utilized for church ornaments.

The place of their habitation is also obscured, as it was hardly possible at that early period for water to have been developed in the valleys and plains below, where are now fine farms and orchards, and many believe that their homes while at work were in dugouts and tunnels in the steep sides of the canyon near the work. Prospecting for these old habitations has been talked of a great deal and but little work done toward it. The sides of the mountains here are very steep and dugouts could have been made with very little work. Some day, maybe, some old prospector will dig in there and find the beginning of these old places of rendezvous, and find something that will give to modern civilization some astonishing revelations of ancient mining. J. M.

Santa Monica, Jan. 24th, '97.

The Drainage of American Flat.

Written for the MINING AND SCIENTIFIC PRESS by DAN DE QUILLE.

NUMBER II.—CONCLUDED.

At Virginia City, beneath which place the Comstock was strongest and richest, is seen a great basin-like depression, with an uneven and eastward-sloping bottom, surrounded on all sides with rugged hills. It was the opinion of Professor W. Frank Stewart, an old Pacific coast prospector and semi-scientist, that wherever large flats or marked depressions occurred on the course of a lode there would be found the strongest and richest deposits of ore. This theory seemed to hold good on the Comstock. At Gold Hill there is a depression, similar to that at Virginia City, but smaller, and at Silver City, a short distance below, where is an extensive system of gold-bearing lodes that have been paying steadily for nearly forty years, there is another depression of irregular form and somewhat broader than that at Gold Hill. At American flat the depression is more marked and better defined than are any of those at the points mentioned above. Therefore, if there is anything in Professor Stewart's theory, there should be some good bonanzas on that section of the lode.

On the west side of American flat rises a high and rugged mountain ridge—a continuation of the main range at Virginia City of which Mount Davidson is the culminating peak—which shows many evidences of volcanic disturbances. This range of igneous rocks has as its predominant peak a mountain smaller than Mount Davidson, on the west side of which is an old volcanic crater that has thrown out a great amount of honeycombed lava; on the west side of Mount Davidson is a similar extinct crater. These two are the only old volcanic craters found in the mountain range in which the Comstock is situated.

At the west side of the flat, running along the base of the range mentioned above, is a large reef of gypsum; on its south side is an isolated mountain which evidently came up through the bottom of a lake, as it has on its summit a considerable depth of smoothly washed gravel. Although smoothly polished and apparently sound, all this gravel has been completely cooked and may be crushed to powder by the pressure of one's naked hands. When upheaved this mountain also brought up with it on its crest a lot of logs—parts of trees—all completely petrified. One of these logs was 2 feet in diameter and about 40 feet in length. On the east side of the flat are some low, rocky hills, among which are pushed up small areas of sedimentary rock. A patch of this of slaty character and blue-gray in color shows in its cleavage fractures very beautiful impressions of seaweed and other marine plants. These imprints of plants are red, brown and orange in hue, the leaf markings very distinct and the colors bright.

In the flat on the east side, near its outlet into American ravine, was a considerable area of placer ground, which was worked from time to time by various parties and paid small wages—$2.50 to $3 a day to each man. The gold in this ground evidently came from the croppings of the lodes above on the flat. In the rocky walls of the outlet of the flat is a large vein of low-grade gold-bearing quartz. The croppings average about $5 a ton, and by sinking on the vein much richer ore would likely to be found. Aside from the mines and metals it contains, this

section of the Comstock range is a very interesting region, and one in which a geologist would find many objects worthy of critical examination. In the large mountain on which are the petrified logs is a big vein of chalcedony, showing many beautiful arboresent forms and red, blue, green, white and brown in color. Some nodules of this mineral are quite opalescent, resembling Mexican fire opals.

The Comstock now occupies a secondary position among the mining camps of Nevada. The De Lamar, in Lincoln county, in the eastern part of the State, is now the leading mine of Nevada, and is one of the strongest and richest mines on the Pacific coast. The April Fool, Magnolia and other lodes in the same great gold belt are but little behind the De Lamar. Rich and extensive mines are being opened at the new camp of State Line, on the Utah border. At Osceola, White Pine, new discoveries in lode and placer and rich developments are being made, while the Dexter mine is giving new life to Tuscarora. In Elko county, at Island Mountain, an immense reservoir is being constructed and preparations are being made for working by hydraulic process some 6000 acres of wonderfully rich placers. Work is also in progress on several other areas of rich placer ground in the same county. Among these are the deep drift placers or drift diggings at Van Duzer creek, which are paying $100 a day to the man, with other diggings equally good being opened.

At present more enterprise is being shown by the miners of eastern Nevada than has lately been exhibited by those along the western border. Therefore, if the people of the Comstock would not fall still further behind, it behooves them to bestir themselves and make some new ventures by draining American flat, opening up the "west country," and by looking after the other "possibilities" of their famous old mining field.

The Gravel Fields of Northern California.

Probably as extensive and valuable placer mining enterprises as are in the world are in Trinity and Siskiyou counties, California. They embrace an area of 12,000 acres, and are being developed by French capital, introduced by Fred Beaudry. Some years ago he investigated the placer fields of Trinity and Siskiyou counties, secured some of the cream of the country and interested French capitalists, who now control the 12,000 acres of gold-bearing ground in the two counties.

Trinity and Siskiyou counties adjoin, the former on the south and the latter on the north, bordering on the State of Oregon. The country is mountainous, and the culminations are sharp, while the canyons and valleys are rich in auriferous gravel, eroded from the mountain slopes through the the lapse of centuries.

The Trinity county placers are on the Trinity river drainage. That stream flows into the Klamath, and the latter into the sea. The county is heavily timbered, well watered, and the climate is mild and equable. All up and down that region the sand and the gravel bars are flecked with the yellow metal. All this region is well timbered, watered and accessible by good roads.

In the purchase of grounds, building of ditches, flumes, pipe-lines, the establishment of giants, buildings, telephone and telegraph systems, electric plants, roads and bridges, sawmills, etc., more than $1,250,000 has already been expended, and the work of improvement and development goes steadily on. These syndicates have established the foundation of enterprises that will give employment to hundreds of men for a long time. At different times 400 or 500 men have already found employment on the various works. Of course, after these improvements are well established, and the enterprises are in full swing, less men will be required, and the profits will be correspondingly greater.

The LaGrange Hydraulic Gold Mining Company.—This company's property embraces an area of 3174 acres, and is located in Oregon Gulch, Junction City and Weaverville mining districts, Trinity county. It was purchased in the spring of 1893 by Fred Beaudry and Baron Ernest LaGrange of France. Ditches were extended and enlarged, building improvements multiplied and the entire system placed on a basis of magnificent proportions. The gold-bearing gravel was found to vary from a few feet to 400 feet in depth. This property is splendidly equipped with an extensive water system.

A canal has been constructed from Rush creek, 14½ miles, having five tunnels, aggregating 2118 feet in length. These tunnels have a grade of three-fourths to one inch to the rod, and some of them are heavily timbered almost their entire length, while about seven-eighths of the ditch is in rock. These water courses are 7 feet on top, 4½ at the bottom, 4 deep, grade 14½ feet to the mile, and carry 3000 miners' inches, or 60 cubic feet of water per second. To avoid four miles of expensive rock work, a pipe-line was put down 1681 feet in length, 18 inches in diameter, with depressions of 355 feet.

At West Weaver a pipe-line was installed, 2224 feet in length, 28 inches in diameter, with a fall of 150 feet, and depression 450 feet below this discharge. Water rights acquired by this company are very valuable. The main canal is 14½ miles in length, with a capacity of 4000 inches; upper Loveridge ditch, 4 miles, capacity 1500 inches; lower Loveridge ditch, 1¾ miles, capacity 600 inches; with five or six of minor importance, making the aggregate about 23 miles, with capacity of 7000 inches. The waters are taken from Rush, West Weaver and other creeks.

To increase the volume of water, Rush creek and Stewart's fork are being connected by tunnel through the mountain, 9000 feet in length, 5x7 feet dimensions, passing under the comb of the mountain at a depth of over 3000 feet. Power drills are now working from both sides. To bring the water from Stewart's fork into the mouth of the tunnel 8000 feet of flume had to be constructed on that side. Several thousand feet of the tunnel are already completed, and the work is being pushed day and night. At present the available water supply is from Rush creek, and amounts to 3000 inches, under a head of 250 to 450 feet, delivered through three giants, with nozzles from 6 to 9 inches in diameter, and 18-inch inlet.

At the top of Table mountain a large reservoir has been constructed, supplied by the canal system, from which pipes radiate to the various giants, 15, 18 and 22 inches in diameter, and under various heads. The mine is equipped with a top sluice 108 feet in length, 6 feet wide, 3 deep, with a grade of 8 inches to 12 feet, paved with block riffles 16x16½, 11x13, 13x13, followed by ground sluices 100 feet long. Still below are forty-three boxes, 12 feet each, paved with block and stone riffles. At the end of the main sluice is a chute with right and left undercurrent, one 18x48, the other 24x36, paved with rock riffles. Grade of upper sluice is 8 to 12 inches to the box of 12 feet. The larger intervening boulders are handled by derrick.

Electric plant, telephone and telegraph systems and other improved features are in the equipment. In the mine 9000 feet of sheet iron and steel pipe are in use. The tailings are dumped into Oregon gulch, which discharges into Trinity river, above Junction City.

This company is incorporated under the laws of Colorado, with W. H. Radford as superintendent. The property is producing $1000 net per day of 24 hours. But, with the increased water supply and the additional improvements being made, the company will soon be prepared to greatly increase the gold output. W. S. Louden & Son were the engineers in charge during the preliminary stages of its development.

The French Hydraulic Gold Mining Company.—This enterprise is located at Junction City, ten miles from Weaverville, the county seat of Trinity county. The property was purchased by Mr. Beaudry of Dr. A. H. Hayes, of Boston, June 23, 1893, and January 20, 1894, the present company took possession. Its area is 1800 acres, and the company is still acquiring more territory. The property was mined for years in a rude and limited way by some of the early Californians. It lies on the west side of Trinity river. Operations at present are mostly confined to the McKinney and Picket claims, which are extensively equipped with pipe lines, sluices, ditches, flumes, giants, etc. These gravel deposits are terraced, the lower 80, the upper 100 feet in depth, 1000 to 3000 feet in width, extending along the west bank of Trinity river for a distance of three miles.

The main ditch taps Canyon creek, is twelve miles in length and has a capacity of 3000 miners' inches. It is 7½ feet at the top, 4½ on the bottom, 4 feet deep, and the flumes are 4x6 feet, with 2-inch bottoms, 1½-inch sides, and grade 10 feet to the mile. At Butler's Divide a syphon 35 inches in diameter and 2214 feet in length is in use. Water is conveyed by the ditch system to a penstock, thence by a large pipe-line to the river. At this point a suspension bridge 516 feet in length spans Trinity river, along which the large pipe-line extends to the opposite side, thence to the works where the water is utilized. The span is 335 feet, cables 4½ inches in diameter, weight of each 33,000 pounds, fastened at the ends by tunneling into the rock, with iron stanchions firmly cemented in the solid granite. In this work about 4500 feet of 15, 18 and 26-inch pipe were used. Twelve miles above the head of the ditch the company has secured the right to the water of a lake, the source of Canyon creek, in the Granite mountains, at an altitude of 5600 feet. It has an area of 160 acres and is of unknown depth. The fall in these diggings from the penstock to bedrock is 400 feet, working pressure 225, using No. 7 to 14 iron. Several bedrock drains in the McKinney claim are from 20 to 35 feet in depth, blasted in the clay slates. The bedrock formation is a dark slate, with streaks of quartz and bands of porphyry. No. 2 flume is 1000 feet in length, 4½ feet wide, with grade 5½ inches to 12 feet, and paved with block riffles 10x15½. No. 3 flume is 840 feet in length, 4½ feet wide, grade 8 inches to the box of 12 feet, and paved with block riffles 12x12. Dump from the end of No. 2 is 100 feet above the river; from No. 3, 95 feet—thus affording ample fall for tailings and room for the establishment of undercurrents.

Ten giants are operated on the property, so arranged as to perform the greatest possible execution. A bedrock tunnel has been run on the southeast end of the claim 260 feet; from the breast an incline of 30, and an upraise of 55. The tunnel contains sluices 5½ feet in the clear, with block riffles 12x12.

Operations on the Picket claim are more limited, and the water is taken from McKinney and Mill gulches. The ground being worked is the first, or lower, bench, and the characteristics are about the same as adjoining properties. The works consist of a flume 400 feet in length, 4 feet wide, 6-inch grade, with block riffles 10x15. The necessary pipe-liae is 600 feet of 15-inch No. 7 iron.

Edward Cumenge is president of the company and chief engineer of the LaGrange. The general management of this property is in the hands of E. Saladin. Mr. Beaudry is local administrator, while the main office is in Paris.

The Minersville Hydraulic Gold Mines.—Minersville is eighteen miles from Weaverville, on the east fork of Stewart's fork of Trinity river and 2300 feet above the Pacific. In August, 1894, Fred Beaudry purchased a lot of these placer grounds and began active operations on them. The various consolidations aggregated 2800 acres, including the town of Minersville, which he also owns. Since taking possession he has constructed a system of ditches, the principal one of which is nine miles in length, taps the east fork of Stewart's fork, has a capacity of 5000 miners' inches, is 9 feet wide at the top, 6 at the bottom, with an average grade of 15 feet to the mile, and in places it is lined with 1½ to 2-inch planking. Waste gates and flumes are of 2-inch lumber, with 4-foot sides and 6 feet on the bottom. Length of main canal and laterals, 16 miles,

On the property are fine bodies of sugar pine, cedar and spruce, with a sawmill for cutting them into lumber. Over 4000 feet of sheet iron and piping have been laid, 15, 18 and 22-inch, with four giants under a pressure of 350 feet. Seven miles of roads have been constructed, and upon the property is one of the largest giants in the world. Its weight is nearly 4000 pounds, discharge pipe 16½ feet in length and inlet 18 inches. The property is in fine shape and is yielding lucrative dividends. Like the Junction City placers, these gravel bars are in benches. The gold is coarse.

Siskiyou Hydraulic Gold Mines.—On the south fork of Scott river Mr. Beaudry has purchased 974 acres of placer ground and is equipping the tract for extensive operations. The territory is on the Klamath river drainage, and the headwaters are several deep lakes, varying from 20 to 160 acres each. There are two ditches on the property—one from Boulder creek, with capacity of 1500 inches, and the other from Fox creek, of 7000 inches. Boulder and Fox lakes can be utilized, thus greatly increasing the volume at nominal expense.

From three acres of the old diggings at this point $170,000 were taken. The gravel has been thoroughly prospected. Along the river is virgin territory which prospects well. It is 200 to 600 feet in width, 7 to 20 feet deep, and full length of the claim—9500 feet. On the mine are 2000 feet of 11 and 15-inch pipe, several giants and other improvements. Pressure of the Fox ditch, 300 feet. Ditches, flumes, pipe-lines, sawmills, electric plant, roads and various other improvements are in course of construction.

The Beaudry Hydraulic Gold Mines.—On Wild Cat creek Mr. Beaudry has purchased 1810 acres of gold-bearing gravel bars, a short distance from the other Siskiyou properties. This mine has an average width of about 5000 feet, is over 9000 feet in length, and the auriferous gravel is from a few feet to 100 in depth. Along the streams and on the sides of the hills, ridges and mountain slopes, gold in paying quantities is found. By extending the ditch already completed to Grizzly gulch on to Jackson creek, an ample volume of water would be the result for extensive hydraulic purposes on the mine. This could be accomplished by the extension of the Grizzly creek ditch a distance of about 8000 feet.

C. L. HALL, M. E.

Railways and Mining.

British Columbia is fortunate in having the advantages of lively railroad competition. Without it the great mines of the Kootenay country would yet be only prospects awaiting development, for only a small proportion of the ores could be shipped to smelters without reasonable rates. Probably the best indication of the value of the mineral resources of the country is the fact that the competing railroads are at great expense pushing their branches into it. Contractors are building a line from Trail to Robson; the Great Northern expects to build a branch from Bonner's Ferry to Nelson; an application is out for a charter for a road from Lethbridge, Northwest Territory, to the Fraser river or the Gulf of Georgia; it is probable that the Canadian Pacific will build a number of branch lines into British Columbia to hold trade, and a gang of men is clearing the right of way for the Slocan river branch of the Columbia & Kootenay Railway, and another gang is clearing the right of way for the C. P. R. road between Slocan crossing and Slocan lake.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The Black Prince, at Ione, has been bonded by Geo. Walker for thirty days to Cutting & Jordan, the lessees. They are putting up machinery to work this and the Leoni mine.

The Union Consolidated at Clinton, at the depth of 400 feet, has made a rich strike. The ledge is 16 feet wide, of free milling quartz, and is expected to average $10 a ton. The shaft was continued deeper, and, at 480 feet, struck a rich body of galena rock. The owners are continuing to sink the shaft to yet greater depths. They have a 30-stamp mill and contemplate increasing its capacity.

At the Bellweather property, owned chiefly in Chicago and located at Jackson, they have just completed a crosscut from 282 feet in depth, 130 feet east, the last 50 feet being in ledge matter which assays well. Sinking is being prosecuted steadily, the shaft now being about 320 feet in depth.

Fisher & Thompson of Stockton have bonded the ledge on the Mullen property, on Mule creek, near Ione.

Butte.

Register: On Magalia ridge, in the Peter Woods mine, owned by the English syndicate, eighteen men are employed under the supervision of E. C. Paxton.

In the same vicinity, the Ethel gold mine, owned by a New York syndicate, of which Prof. Thomas Price is the general manager and W. D. Edward superintendent, twelve men are employed.

In the Princess mine ten men are employed under Superintendent Geo. E. Hogg. It is reported that an excellent quartz ledge has been struck in this gravel mine.

In the Bader mine, of which Geo. B. Mowry is superintendent, three shifts are employed, and the gravel is paying well. The tunnel is now in 1500 feet.

In the big Magalia mine there are forty-five men at work.

On the John Dix mine, which is owned by R. Diller of Chico, six men are employed, and it is reported that the gravel pays well.

D. A. Metheson, near Nimshew, is running an open cut on his quartz mine and uncovering the ledge, which crops out for a long distance. This is what in former years was known as the old Meredith ledge. Mr. Matheson will probably in the spring erect a quartz mill upon his property.

Calaveras.

Prospect: The Sterling brothers have pumped the water out of the Wide West mine. The shaft is down about 180 feet, with two drifts at the bottom, out of which good rock has been taken. The ledge averages from 10 to 18 inches.

Thomas H. Jenkins, on Skull Flat, has cleaned out an old tunnel on a claim above the Barnhardt ranch. The tunnel was worked in early days. After clearing out about 200 feet of old driftings he uncovered a vein of ore avering from 12 to 18 inches wide that will prospect very high, is free milling, and carries a nice looking high grade of sulphurets.

El Dorado.

(Special Correspondence).—Scuppon & Alexander are prospecting on the old Moses Miller mine, three miles south of town. Their tunnel is in 65 feet. The ore body is 5 feet, and averages $6 per ton. The ore is milled at the Larkin mine. The sulphurets run 2 per cent and average over $200 per ton.

McCue & McPherson are opening a large gravel property on the Bennet ranch, twelve miles west of town.

Prospectors have uncovered an unusually large ledge on the north side of the American river, four miles north from here. The property belongs to a Mr. Hartman of San Francisco.

Seymour & Staver are doing systematic development work on the old Vandalia property, thirteen miles southwest of here. They have completed over 400 feet of underground work. The mineral-bearing ore is said to be similar to the Utica holdings—quartzite, amphybolite schist and soda spar. The young men are working vigorously and with success.

It is reliably reported that Ballard & Martin will begin work on the old Superior, or Tincup mine, three miles south of town, early in the spring. This was a richly-paying property ten years ago. The old 10-stamp mill still remains upon the property in a fair state of preservation. The greatest depth attained when this plant was operated was 155 feet.

J. T. McNutt started development work on a 12-inch cropping. The shaft is now down 25 feet on a 24-inch ledge of good ore in a slate formation. The property is thirteen miles southwest of Placerville, near the Big Canyon mine. It is called the Rockefeller.

Placerville, Feb. 1st, '97.

Gazette: At the Ohio mine, about one-half a mile from Greenwood, they are at present working a force of ten men night and day. The shaft is 300 feet deep and they are taking good ore from the bottom of the shaft; the quartz has a good showing of gold, and there are prospects of a mill in the near future. This mine is bonded by San Francisco parties.

At the Welch mine, north of the Ohio, they are sinking a shaft and are now down about 150 feet. They intend going down much farther, as their prospects are good.

At the Garibaldi mine, owned by San Francisco people, the tunnel is between 300 and 400 feet and the ledge is 8 feet wide, the ore found assaying at $8 per ton.

The owners of the Lucky Marian intend placing machinery on the mine and a 20-stamp mill be erected which will be in position to resume work this month. The shaft is 110 feet deep; the ledge in south drift is 19 feet 6 inches in width.

Hickman and Stevenson are working the southern extension of the Lucky Marian and have started to sink a shaft.

The Walker mine has been bonded to parties in San Francisco. There is a 5-stamp mill on the property and good work is being done.

Kern.

Johannesburg *News*: W. D. Sollender has sold to Rogers, Pepper & Allen, the owners of the Wedge mine, the Gold Mountain group of mines, situated one mile east of Johannesburg, which contains thirteen claims and lies on the west slope of the mountain. A big force of men has been put to work and more will be added as fast as room is made for them. The new company purpose erecting a mill as soon as development justifies it.

The Standard mine, lying west of the Little Butte and Kenyon mines, has beed sold to A. C. Harper of the Harper-Reynolds Company of Los Angeles. A force of men has been put to work developing the claim.

Nevada.

Union: Some rich ore has been uncovered in the Pocahontas mine at Gold Flat. The ledge is a good-sized one and there is every indication that the pay streak will continue as depth is attained. In past years ore yielding as high as $105 per ton has been taken out, but the mine has never been worked below the water level.

Placer.

Argus: The California Debris Commission has received an application from G. D. Duncan & Co. to mine by the hydraulic process in the Pebble Bottom mine, near Yankee Jims.

Johnson, Graber & Dyer are putting up a Huntington mill on the old Gayetty ledge, on the Bear river slope.

Herald: At the Red Point sixty men are employed. The old channel is being followed and they are in over 10,000 feet, the prospects continuing good. This mine is operated by a French company whose interests are looked after by J. A. Ferguson.

The Morning Star mine at Iowa Hill continues to be one of the most steady paying properties in that section. A dividend of $6 per share was recently declared.

The Big Dipper mine near Iowa Hill is in active operation and is a good producer.

The mining operations in the vicinity of Michigan Bluff are at somewhat of a standstill owing to the lack of water, but after the first heavy rain work will be vigorously prosecuted.

The old Evening Star mine on the James Heenan ranch, on Rock creek, has been opened up by a San Francisco company. About fifteen men have been engaged the past two weeks in cleaning out the old shaft, and when the drifts are reached as many more men will be employed. The Evening Star is a good property, and a good deal of money was taken out of it in early days.

Since the Dam mine was purchased by the Hidden Treasure Company, Centerville, where it is located, has become an important point, and when active operations begin in the spring it will be one of the liveliest camps in the mountains, owing to the large number employed about the mine.

The Hidden Treasure at Sunny South continues a steady producer, although only a comparatively small force is now employed.

Work at the Mountain Gate mine is being carried on with speed, the tunnel now being opened a distance of 5000 feet, and they are crosscutting for solid gravel. This property is owned by the Hidden Treasure Company.

About sixty men are employed at the Pioneer mine under the management of D. J. Sullivan. A shaft is being sunk from the 500 to the 1000-foot level, and the mill is kept running steadily night and day. Tunnel No. 4 is now in 2200 feet, and they will have to go in 500 feet more to reach the vein. Power drills are kept in constant operation, and 10½ feet a day is made. The company recently purchased four other claims adjoining their own property and ore is being taken out and milled at the Pioneer, and thus far with good results. This mine is owned by a Boston company.

Riverside.

Independent: Work has been suspended on the Golden Chariot mine, near Perris.

The St. Elmo people have opened up another extensive body of rich gold in a drift about 250 feet from the main shaft.

The Jumbo Mining Company are now operating the Santa Fe mill, near Perris.

The upper shaft in the old Santa Rosa mine, near Perris, has reached a depth of 254 feet, and thirty men are employed. The drifts from the new shaft are within 15 feet of those of the old shaft, and 25 tons of ore are extracted daily and milled at a good profit.

Twenty men are now employed on the level in the Good Hope mine, Perris, where the rich strike was made last week. The ore body is holding its size and richness. The superintendent says the stamp mill will be started shortly.

Shasta.

Searchlight: Dr. O. H. Simons has held a bond on the Balakalala for some time. This bond has recently been assigned to Alex. Hill, manager of the Mountain Copper Company, who will thoroughly explore the ore body, and, if he finds it satisfactory, the expenditure of large sums of money in railroad and increased reduction capacity is assured. The Balakalala group is composed of about forty claims, and, like the Iron Mountain, is a large mass of sulphide ore. The property is located about four miles northeast of Iron mountain.

It is reported that a sale is pending of the Texas Consolidated at Old Diggings, R. G. Hart, Sr., owner. This property is the largest quartz mine in operation in northern California and is developed to a depth of 1100 feet; it is equipped with a 20-stamp mill and a complete plant for saving and chlorination sulphurets. Electric power is used in the mill and an electric hoist is now being placed in the tunnel No. 5 to take the place of a gasoline hoist heretofore used.

D. Hunt, who has charge of Senator Jones' interests in Shasta county, has a force of men employed running a 500-foot tunnel on the Ballou mine on South Fork.

W. H. Goulet, a leaser on Deadwood, has struck a rich find in the upper works of the Last Chance ledge.

The Ancient Channel drift mine of Delta, which has been idle for some time, will shortly resume operations.

Chas. Butters will inspect his interests in Shasta county this week. It is said on good authority that his visit will probably result in extensive development work in the neighborhood of Kennett.

Free Press: The demand for siliceous ores is increasing through the operations of the Mountain Copper Company. This fact is giving an impetus to mining and prospecting within a range of several miles from Keswick and Redding. A home market has been created for a marketable ore product, and the industrious miner, who is able and willing to work, may, with small capital, except his muscle, make a living. At present the demand for silicious ores is greater than the suppiy, and the company have taken hold of several properties which they are developing at their own expense.

While the Uncle Sam mine on Squaw creek is worked out, yet there are about a dozen of the old hands with their families living there and making good wages with leases from the company.

The Princess Hydraulic Mining Company have completed their long ditch from Boulder creek to Horsetown, a distance of eleven miles. The water has been turned in and they have started the giant in the mine at Horsetown.

Siskiyou.

S. J. Fore, of the Last Chance mine, near Callahan's, has purchased an Evans' elevator, which is capable of hoisting 200 tons of gravel per hour. Everything is in shape to operate the mine on an extensive scale. Last Monday Mr. Fore placed thirty additional names on the pay-roll.

Journal: Grayson and Hunter, who have bonded the Blue Gravel mine at Greenhorn, are sinking a shaft to strike the gravel bed lower down the creek and then work up to the old shaft.

Prospectors are locating new claims everywhere in the county to commence work for the spring season, and companies are being formed to work old claims on a more extensive scale.

Several quartz ledges will be worked during the coming summer that have been idle on account of the ledges pinching out. It is the intention to explore for the lost ledges by going down deeper and running crosscuts.

Journal: The Blue Gravel mine, near this place, will be reopened in the course of thirty days by San Francisco parties brought here by H. H. Hunter, who will retain an interest in the property.

Several big mining deals are about consummated in the county, among them being the construction of a flume to cover the high bars below the pumping plant on Shasta river. These bars are known to be very rich, good wages being made by wheeling the gravel four hundred yards to the river and rocking it.

News: Charles Bienbaum is running a tunnel on the Jasmund mine in Humbug district. It is a well-defined ledge and can be traced for 2000 feet.

There will be some extensive improvements made at the Jumbo mine in the spring, including a cable tramway, a wagon road and some additional improvements in the mill which will be started after the tramway is completed.

Work is progressing on the 400-foot level in the Brown Bear, at the head of White's gulch. The vein was reached in 240 feet by a crosscut tunnel which was extended some 200 feet past the ledge, but the work now being done is drifting on the vein.

Trinity.

Journal: At the Sybil group of mines near Deadwood there are sixteen men employed. There is enough ore of good quality in sight to run the mill steadily.

At the Bloss & McClary mine the company are piping night and day. On piping off a slide from the mountain a good deposit of gravel was found lately.

G. L. Carr has made a new strike in his mine near Carrville. He ran in a prospecting tunnel and then raised, striking the ledge in two places.

On Coffee creek the Trinity Gold Placer Mining Syndicate are running their bedrock tunnel for the purpose of getting dump and will have it completed by spring. They will then be ready to operate their rich placer mine on a large scale.

There are large deposits of gravel at Trinity Center and vicinity, along Coffee creek, on Dutton's creek, or Indian creek, around Weaverville, at Junction City, Canyon creek, Rattlesnake, Minersville and along the Trinity river, which have not been worked to any extent owing to the expense of bringing on water.

At Hay Fork considerable work is being done in the mines. Duncan and Pragmore on Morgan gulch are taking out ore and have struck a large body of rich rock.

B. Kellogg is working two men on his ledge on Kingsbury gulch and is taking out ore.

W. C. Drinkwater is running his placer mine with good results.

Quite a number of men are working with sluices and rockers in Kingsbury gulch.

Tuolumne.

Union-Democrat: The mines around Yankee Hill are showing up well. The Silver Queen, owned by Geo. Mapes, is being steadily worked.

The Wood's Creek mine, in the vicinity of the Silver Queen, is showing a large and rich vein. It has attained a depth of 120 feet, and drifting is being done.

Work on the shaft of the No. 1 mine at Stent is being pushed forward, and Jimes McGinn, the owner, expects to develop a good body of ore as soon as a contact with the vein proper is effected.

Mother Lode Magnet: The mill at the Shawmut mine is nearing completion, and the mine will be in operation within the next two weeks.

The Confidence mine, which had been running from ten to twenty-five stamps at regular intervals, started up the full complement—thirty—last week. There is a large quantity of ore on the dump, and the mine is said to look better than ever. The company employs forty-three men.

There is some work being done on the Green mine. It is the intention of the management to begin work on an extensive scale as soon as the condition of the roads will permit.

Mother Lode: It is reported that the App will erect forty additional stamps this coming season.

The Old Bonanza mine, within the city limits of Sonora, and from which several of the present leading citizens of the county secured their fortunes, is to be reopened, after having been shut down and abandoned for years. Owing to the pockety nature of the ledge matter, the mine has never heretofore been worked systematically as a milling proposition, and it was through losing the rich pay streak that the old claim was abandoned.

The California Exploration Company, which recently purchased the Bellevue mine, have closed down the mill. It is the intention to expend $100,000 on development work, that the mine may be properly opened up.

John Dingle and associates of Sonora have bonded the Mullen mine, six miles east of Sonora, to a San Francisco syndicate. The new company will at once commence the sinking of a new shaft.

The new chlorination works, of three tons capacity, at the Star mine, are completed and giving good results. Ten stamps are dropping steadily on ore from the mine.

NEVADA.

Surveyor General Pratt of Nevada, in his biennial report, says that in the western and southwestern portions of the State, where formerly was produced the bulk of Nevada's silver, gold mining is experiencing as much of a revival as elsewhere. In Esmeralda county the Silver Star mines are paying their owners a good profit, and Silver Peak is proving to be a good gold-producing camp. The Big Indian, Marietta, Mt. Grant and Hawthorne district mines all make a good showing.

The bullion product of Nevada, according to statistics furnished by the Superintendent of the Mint, for 1895 was:

Gold	$1,780,204
Silver	1,051,992
Total	$2,832,196

For 1896:

Gold	$2,955,140
Silver	998,555
Total	$3,953,695

This shows a gain for 1896 of $1,121,499, due principally to the output of the counties of Lincoln, Esmeralda and Elko.

Dayton *Times*: Considerable work has been done on the Logan and Hulley mine, in Como district, this winter, and a great deal of ground has been opened up. At present five men are at work on a lower tunnel. There is low-grade ore enough in sight in the mine to keep a 10-stamp mill running for years.

Enterprise: A new ore body has been uncovered on the property of the Golden Eagle Mining Company, in Humboldt county. As soon as the new working tunnel is completed, the Board of Directors will meet to arrange for a mill with which to handle the ores that are now being blocked out.

On the Ophir group, the development of which is being prompted by the same gentlemen, the tunnel is being pushed ahead with two shifts.

The owners of the Blackbird, which has been productive of some high-grade ore in the past, have resumed work. The mine was closed down about two years ago. The mill, which has been idle since, will be started up in April, with abundant ore on which to run.

Gold Creek *News*: There are three important works now going on that will do much toward determining the extent and value of the ledges in this camp. At a depth of 50 feet the Snow Flake shaft has passed through the hard hanging wall and has disclosed the side of an ore body for nearly 7 feet. The quartz is plentifully sprinkled with free gold, but no tests have yet been made. The Blue Ridge tunnel is in 150 feet and is now in granite and quartzite. Stringers of quartz have been found all along that may carry gold, but nothing big is expected until the main dike is reached. The Mother Lode tunnel is in 180 feet and as the slate and porphyry in the face break easily, 5 and 6 feet every twenty-four hours is being made. The two tunnels on the Mother Lode and Blue Ridge groups and the Snow Flake shaft were started at about the same time. These are widely separated.

J. H. Robbins has located 480 acres of placer ground on Beaver creek for himself and C. A. Watkins. Beaver creek is six miles southeast of Gold creek and its waters are drained into the sink of the great basin.

Gold Creek *News*: Machinery has been ordered in San Francisco and hydraulicking at the Gold creek mines will commence April 1st. The work will begin near the head of Hope gulch, and four giants will be started about that time. Some 5000 feet of pipe will be laid. It is expected to install a plant that will eventually work from 40,000 to 45,000 cubic yards of gravel a day.

Walker Lake *Bulletin*: At Silver Peak the

dumps of the Western Soldier and Drinkwater mines are full of ore.

Work on the Mary tunnel is being pushed night and day, and there has been a favorable change in the face during the last few days. It is in nearly 800 feet and is about 500 feet below the surface.

In Alida valley they are still taking out rich ore from the Suwana mine.

Reese River *Reveille*: T. J. Bell's placer claims at Ione are producing more gold than ever. Several other valuable discoveries have been made of late.

OREGON.

Baker City *Democrat*: E. M. Hand has finished an examination of the Columbian mine in the Virtue district, controlled by W. G. Press of Chicago. Mr. Hand found that the vein averaged over $15 to the ton in gold, and averaged over 3¼ feet in width, while the west drift, which is in 75 feet, showed the same average in value and width of vein at the 175-foot level. A steam hoist is to be placed upon the property at once and development pushed. A 10-stamp mill will be erected upon the property in the spring.

Medford *Mail*: All the placer mines along Evans and Saxe creeks are in full operation with plenty of water.

The Brooks placer mine is running in full blast with good supply of water.

F. McComb and H. Oden are mining a placer mine, below the mouth of Saxe creek, with a big head of water.

Jacksonville *Democratic Times*: The Linchpin mine in Wagner creek district has developed a body of good sulphuret ore, 7 feet wide, at a depth of 114 feet.

Philips & Strong of Waldo district are building a long line of 3-foot flume for an outlet.

Morris & Smith, who bought the Polk Dews mine on the Palmer creek some time since, one day last week picked up a $27 nugget.

Gold Hill *News*: Kane creek, near Gold Hill, is under bond to Boston men. They will take water (5000 inches) from Bear creek. This will require a ditch thirty miles in length, which will give them 400 feet fall at the head of Kane creek.

The old Gold Hill mine, said to have produced a large sum from a pocket in early days, is being developed by a crosscut tunnel, cutting the ledge at a depth of about 250 feet.

Dr. Braden will start his quart mines and mill next week.

J. Beaman is taking considerable ore out of the Ritter and will start his mill shortly.

Parties are negotiating for the Sardine creek placer fields. This is a very extensive gravel deposit.

A number of small placer mines are operated around Gold Hill. With a high line ditch southern Oregon would produce several millions in gold every year.

The Black Channel, on Foots creek, is being put in working order. Large reservoirs, flumes, etc., are being built.

BRITISH COLUMBIA.

Spokesman-Review: In the Kettle river district the owners of the Pathfinder are negotiating for a sale to Montreal and Toronto parties. Should the deal fail, there is a large English syndicate anxious to get hold of the property, and who propose the erection of reduction works as soon as practicable.

A half interest in the Golden Crown, in Wellington Camp, about half way between Grand Forks and Boundary creek, has been sold to T. M. Daly for $15,000.

The Ruth mine in the Slocan, which recently came into the hands of Mr. Forster of London and George Alexander of Kaslo, is shipping about 600 tons of ore monthly.

At the Noble Five there are about 10,000 tons of ore on the dump, all of which has been taken out in course of development. The new concentrator is of 120 tons capacity. The mill was started up about a week ago. By May 1 the mine will be opened up to a depth of 1000 feet.

Negotiations are pending for the sale of the Alamo, Cumberland, Slocan mill and tramway and the Idaho mine, all in the Slocan district, to an English syndicate at a price approximating $750,000. The Idaho has already paid in dividends to its owners the sum of $125,000, and is paying a dividend of $20,000 monthly.

The Payne mine is now shipping sixty tons of ore a day. It is said that the ore will run anywhere from 250 to 400 ounces in silver to the ton. The monthly smelter returns will approximate $150,000.

Superintendent Hall of the LeRoi writes that they have struck a new body of ore in the face of the west drift of the 500-foot level, west of the main cross course. They are now shipping 150 tons of ore daily.

Spokane *Chronicle*: D. E. and W. H. McVay have sold their interests in the Ruth mine, near Sandon, B. C., for about $75,000 to people who represent an English syndicate that recently purchased the two-thirds interest in the same mine for $166,666.

The Vancouver *News-Advertiser* says 356 mineral claims were recorded in Kamloops district during the past year.

The yield of gold from the placer mines on the Thompson and Fraser rivers, within the Yale division, amounted to $61,608.

In the Similkameen division the yield of gold amounted to $9000 and of platinum to $750.

Nelson *Miner*: There are at present 863 men employed in the Slocan mines. At the customary wages of $3.50 a day the total daily pay-roll of the district thus amounts to over $3000.

The number of claims staked in this district and recorded at New Denver since 1891 is as follows:

1891	119	1895	638
1892	633	1896	1,085
1893	398		
1894	270	Total	3,143

The Transfer group, between Dayton and Springer creek, has been bonded to W. A. Campbell of Rossland for $20,000.

Work has been commenced on the Skylark and Ranger claims, situated on Dayton creek. These claims are bonded to Mr. Dick of Nova Scotia.

The Rover, on Ten Mile creek, was sold last week to the Carnduff Mining Company at a good figure. This company has now interests in thirteen claims in the district.

J. A. Thompson of Carnduff, N. W. T., last week bought from G. M. Sorelle a quarter interest in the North Extension, Pay Roll and Quadra Fraction, on Dayton creek, adjoining the Exchange, now under bond to R. C. Campbell-Johnstone.

The following is a statement of the ore smelted by the Hall mines smelter during the past year:

	Value.
Gold (575.30 ounces)	$ 11,901
Silver (628,124 8 ounces)	430,843
Copper (2,247,192 pounds)	22,171
Total	$454,908

The ore smelted amounted to 60,262,405 pounds, 59,720,335 pounds being from the Silver King and 542,070 pounds being from outside mines, and 4,775,335 pounds of matte was produced.

Average price of gold per ounce, $20; silver, 67 cents; copper, 10 cents per pound.

Spokane *Chronicle*: The Alpha and Black Bear mines near Sandon have been sold for $75,000 to English parties.

The Kootenay-Columbia tunnel has at a distance of 400 feet opened a large body of high-grade ore, averaging about $30 in gold.

A strike of six inches of ore assaying 390 ounces of silver has been made in the Cordelia in the Slocan.

A. Dick has bonded the Skylark and Ranger on Dayton creek for $10,000.

Mr. Heinze has secured enough ore to warrant him going ahead and enlarging the capacity of his smelter by the addition of two furnaces which have been ordered for the treatment of Slocan ores.

Victoria *Times*: The Kootenay tunnel, which is now 400 feet long and 100 feet in on the Columbia ground, has opened up an 8-foot ore body. This is supposed to be the chute opened in the Columbia tunnel above, from which shipments were made last year which yielded over $50 to the ton.

The ore body found west of the main chute in the Le Roi now measures about 5 feet between the walls and assays about $40 in gold and ten per cent in copper. This is the highest grade ore in copper ever found in the mine.

A double compartment shaft is being sunk from No. 2 tunnel of the War Eagle and is yielding large assays since the new owners resumed work.

According to the weekly reports of the Rossland *Miner* there are now nine regularly shipping mines in the camp.

New Denver *Ledge*: Thirty more men have been put to work on the Reco.

The $40,000 bond on the Skylark and Ranger, Dayton creek, made by A. Dick, has been signed.

A strike of cube galena was made in the Wakefield last week. Some ore soon to be shipped from this property will return a profit of over $100 to the ton.

C. K. Hammond, acting for the Ramsdall Mining Company, of Tacoma, has bonded the Sapphire and Gem on Payne mountain for $10,000, 15 per cent cash.

The Slocan Star is looking better than ever. Between two and three levels stoping is being pushed. The width of the ledge, and the way in which huge blocks of ore are blown down reminds the spectator of coal mining.

UTAH.

Eureka *Democrat*: The Homestake shaft is nearing the 300 level. The vein has left the shaft, but a crosscut to the ore body will be started from the 300.

The Buckeye is producing higt-grade ore, and regular shipments are being made.

The tunnel at the May Day is now in over 500 feet and will be run to the vein, which will probably be encountered in another hundred feet.

The experimental smelter at Mt. Nebo is not ready to start up, but a force of nine additional men have been put on the Star to take out ore.

Salt Lake *Tribune*: The Marion and Geyser have agreed to bury the hatchet and the two properties will probably soon be consolidated. The conflict between the Marion and Geyser has been over ground the ownership of which was claimed by the Geyser. It was also a matter of evidence that the territory in dispute was worth $750,000, and to acquire it a better fight has been waged. It is understood that in the compromise the two properties are consolidated. In that event the company becomes one of the strongest in Camp Floyd mining district. Each has a mill already erected. That on the Marion has a capacity for handling about sixty tons a day, which is now being put through, while the Marion, with its recent improvements, is handling an average of about 100 tons.

Eastern capitalists have secured a bond on the Yankee Girl at Silver City, and that the deal will be consummated is now practically assured.

At Mercur work at the Northern Light is progressing and the early starting of the mill is assured

The Golden Gate has a larger force of men at work now than at any previous time.

At the Little Pittsburg a good deal of exploration has been going on, and it is said there is a better showing than for some time past.

The Gold Dust has a great deal of ore in sight, and cinnabar is not lacking in the workings. That a large mill will be erected early in the spring is an assured thing.

Tintic *Miner*: There is a probability of the Swansea being obliged to shut down on account of the excessive charges for treatment of its ores now exacted by the smelters. These charges, we understand, have been advanced $7 per ton, which means, if shipments are continued, a loss of about $2500 to the Swansea Company.

The Bullion-Beck ore body on the 800 level is reported to be the richest in the history of the mine.

A contract will be let at once to sink another 100 feet in the Pocahontas. It is also stated that a steam hoist is a probability in the near future.

Capt. John A. Bard of the Silver Cloud reports that the shaft on that property is down 160 feet. It is proposed to put proper machinery on this property and to sink a deep shaft.

Jesse Knight states that the new tunnel on the Uncle Sam is now in 100 feet, and he has let another 200-foot contract.

The connection between the surface and the old shaft of the Mammoth mine has been made, and the mine will soon be able to greatly increase its output. The recent high-grade gold ore struck in the lower levels is reported to be holding out well.

IDAHO.

Murray *Sun*: The Golden Chest mill is to be closed down next week, and all the efforts of the company will be concentrated on development work. The upper levels of the Chest are practically worked out, and the company is not at present inclined to run a lower tunnel until some virgin ground on the old levels toward the Idaho line is prospected.

Wallace *Press*: The water is down to the 1100-foot level in the Tiger shaft. Men are being added to the force right along, and by the end of the week there will probably be 100 at work extracting ore. The pumps on the 1100-foot level were found to be out of order and retarded operations somewhat. The mill is giving entire satisfaction.

MONTANA.

Butte *Miner*: The Altoona Mining Company has found some good ore at a depth of 420 feet. About $100,000 has been spent on this property in the past eighteen months. It is thought probably that the great copper belt of Butte may dip in that direction and that a new mining district may be developed.

At this particular point it is thought that the Glengarry lead will be found at a depth of from 400 to 700 feet from the surface.

At a depth of 172 feet the Parrot Company found another stringer on the Hesperus lode claim, under lease and bond from James A. Murray. The stringer is similar to the one found near the surface and contains a great deal of zinc and a trace of copper.

The new Butte and Boston people will start in with a $1,000,000 in the treasury for development work. It is not at all unlikely that for the first two months the smelter will be allowed to remain under lease to the Boston and Montana people. Development work will be done in the mines of the company that are now in some cases only promising prospects. The capacity of the smelter owned by the company is 500 tons per day. If necessary ore can be taken out at once in sufficient quantities to supply the smelter, but the reserves now on hand would soon be exhausted. The developed mines of the company are the Grey Rock, 1,200 feet deep; the Blue Jay, 650 feet; the Silver Bow, 1,000 feet; the Snohomish, 450 feet and the Harrington Placer, 200 feet.

The Rarus mine, owned by F. A. Heinze, is turning out about 500 tons of ore a day.

The Anaconda Company, it is reported, has abandoned the Ground Squirrel mine after spending a great deal of money in exploration work. Some good ore was taken from the mine, but it was found near the surface and nothing was found at the greater depths.

SOUTH DAKOTA.

Black Hills *Times*: A bond and option has been given on a large group of mines situated on the Blacktail divide to a representative of the Leiter syndicate of Chicago, now operating in Cripple Creek, Col. The bond runs for ninety days, at which time the entire amount—$250,000—is to be paid. Among the properties in the deal is the Kicking Horse group, the price of which is $150,000.

The west drift on the Kicking Horse group of mines is now in 260 feet, which completes the contract. During the progress of the work eleven ore shoots were crosscut that carry an average value of $40 gold per ton.

During the past week several parties have been investigating the amount of ore now being produced from the mines and getting data as to the actual amount that could be produced if local facilities were at hand to treat it. The probability is that the parties who have made the examination will report favorably, and the result will be that a custom plant of large capacity will be erected this season.

WYOMING.

Considerable excitement prevails at Sundance over the discovery at Bear lake of a gold ore lead which assays high values. People are flocking to the scene of the discovery, and over 100 claims have been taken up. The formation is said to be the same as that at the now celebrated Ragged Top mines.

COLORADO.

Aspen *Tribune*: Extensive development work is projected on the Park Regent mine, and, among other things, the big incline on the property will be extended an additional 100 feet. Of late some above average ore has been taken from the Regent, both by leasers and company men.

The monster pump station at the foot of the main shaft on the Free Silver mine has been completed and is now being timbered.

It is semi-officially stated that within the next sixty days the Deep Shaft will be started up.

Cripple Creek *Mail*: The Doctor mine on Raven hill is now sending out thirty tons of cyanide ore per day, besides the weekly output of seventy-five tons of high-grade smelting ore.

The Good Will tunnel compressor has been erected, and a contract has been let to drive 500 feet. European capitalists have subscribed $50,000 for this tunnel.

Work will be resumed on the first of next month at the Ross & Hurd tunnel, which enters Raven hill from the east and is running toward the Elkton vein. The bore is in 700 feet and has cut five veins, but none of them has been prospected.

There are forty men now employed at the Vindicator, doing mostly development work.

In the eighth level of the Victor a large vein of ore was opened up a few days ago. The tonnage for January will exceed 1500 tons. A shipment of $162,000 last month will be more than equaled this month. Saturday night 109 cars were hoisted for the different levels, large quantities of which are high grade.

The new pump of the Lucetta shaft, one of the Golconda Company's properties, has been started. It has a capacity of 1800 gallons an hour.

The Christmas for the week ending January 23rd beat all its previous records. A new stope is being opened at the 200-foot level, where 10 feet of good ore is in sight. It shows free gold and sylvanite.

Garfield-Grouse lessees are working a big force of miners. The output now is at the rate of 300 tons a month.

Returns received from the Vandenburg lease on the Jack Pot give a value of $118 per ton on the low grade and $727 per ton on the high grade. The consignment consisted of twelve tons.

Mining Record: At the Breckenridge gold belt heavy and regular shipments of smelting ore are being made and the gold output of the mines is constantly increasing. The developments of the past year have proven that the blanket veins of Yuba Dam flats are lasting.

A. H. Boyd, lessee of the Sultana, is making regular shipments of from 100 to 200 tons per month of smelting ore. The majority of the shipments are iron and sulphide, carrying gold and silver.

At Cripple Creek there are 150 paying mines, from 41 of which there were shipped last year 111,100 tons of ore, at a valuation of $7,540,600, or an average of $68 per ton.

Eighteen good strikes have been made around Cripple Creek since New Year's day. The mills and samplers are all running to their fullest capacity. The output of ore for the month of January, 1897, will equal, if not exceed, any month of the year 1896.

NEW MEXICO.

Silver City *Enterprise*: The Treasure Mining Company, a Denver organization under the general management of S. S. Murply, employs fifty men and is making the property pay well. Last week the work of cleaning out and draining the old Deep Down property, was commenced.

Spiller & McLean are working eight men on the Pacific Gold Company's claim on the Pacific vein.

The Golden Giant Company has thirty-five men employed at the mine and mill.

W. C. Chandler is working eighteen men on the Mountain Key on the 100, 200 and 300-foot levels.

There is considerable stir about the old copper properties in the vicinity of Paschel and Whitewater. At Paschel Thomas Kuncky is working six men and making regular shipments to the reduction works. Between Paschal and Whitewater James Woodward recently started work on ten different claims.

Bell and Paul are going to erect a small smelting plant upon the old Doyle claims, between Apache and Rector's Camp, which they have relocated.

The adit level upon the Copper Queen mine has attained a length of 770 feet with vertical depth of about 500 feet from the surface. For 450 feet the ore body has been continuous without a break. The ore body is from 3 to 5 feet in width and will average over $30 per ton, three-fifths of the value being gold.

ARIZONA.

Journal-Miner: The Commonwealth Company at Pearce is negotiating for the building of a 40-stamp mill for their property, and two mills will soon be erected for crushing ore. Williams and Cooper are to sink and timber a well and as soon as sufficient water is struck the mills will follow.

The Gold Cliff Company, in the Pearce district, is considering the advisability of working its ores. A crosscut on the ledge 112 feet from the surface reveals a vein over 20 feet wide continuing down.

A rich strike is reported in the Gold Cliff mine at Pearce.

The World's Fair mine of the Harshaw district is erecting a concentrating mill and four carloads of other machinery to treat the ore have arrived.

Tucson *Star*: The Patagonia mining region, which embraces Crittenden and Rollin, will be the center of much mining interest during the year. The copper and silver developments are promising. Several companies are developing mining properties which with depth are showing large bodies of high-grade ores. Shipments of ore extracted are increasing in volume, and reduction works are being erected.

Courier: At Chaparral the Annie mill has been started up with ten 900-pound stamps and three 6-foot vanners.

The Lost Horse mine has shut down for a short time because they have the dump full of ore, and the roads are so bad that they cannot haul.

The Lottie is working its mill night and day, and sinking its shaft.

There is a force of men at work on the Bunker Hill mine.

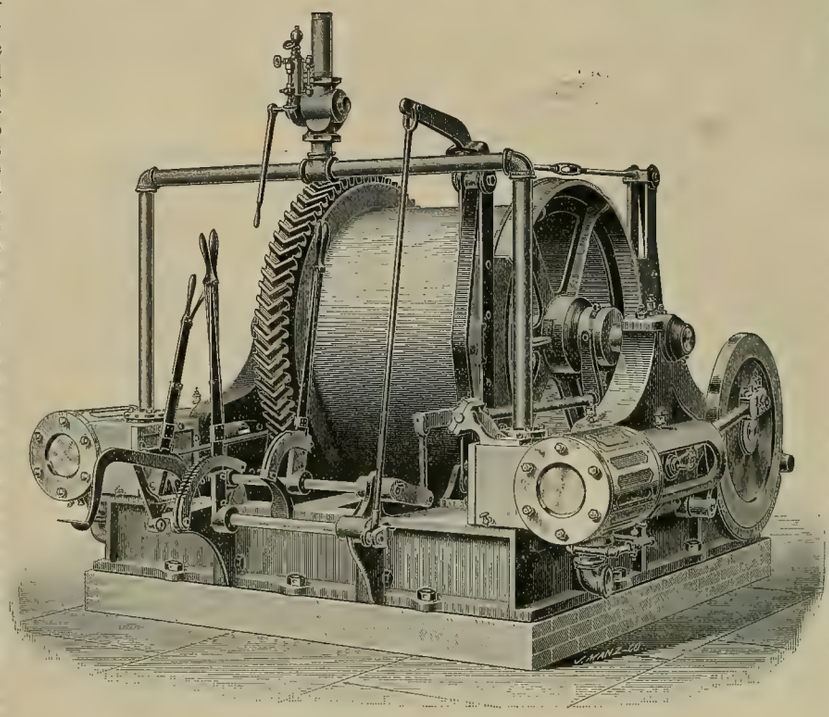
Mojave County *Miner*: H. R. McClure and F. Edwards have made a deal with a Philadelphia syndicate for their properties in Clear Creek. Provisions and mining supplies have been sent out and several men will be put to work.

Mechanical Progress.

Will Steel Frames of Tall Buildings Last?

What is occurring or what will occur to the metallic portions of the many tall buildings that are in process of erection at the present time, under great dissimilarity as regards temperature, humidity and other climatic conditions, but of one characteristic sameness, viz., being sealed in solid masonry or other coverings beyond the ken of inspection? Probably no engineering question of to-day is entitled to more serious consideration than this one. In discussing it recently before the American Society of Mechanical Engineers, Mr. M. P. Wood maintained that while inspection of some of the buildings now in progress, as well as some of those lately erected, reveals possibly a slight improvement in the means of preservation adopted over those apparent a short time ago, yet the improvement is a hollow mockery, and will bear fruit for repentance before many years have passed. These structures, though more carefully painted than those erected before, with more and heavier coatings of some kind of stuff called paint, do not appear in a single case to have received any attention or consideration as to the condition of the metallic surfaces before applying the protective coating beyond a possible sweep with a dirty broom to get rid of the rough dirt from the workshop yard, and a possible wipe with a piece of old sacking to remove the grease due to machine processes. There has been nothing like a washing down of the parts with soda ash or lye water to remove the grease, and then pickling with weak acid to remove the mill scale, and a subsequent washing with lime water to neutralize the acid bath, warming the work before painting it, and taking care to apply the paint only on clear, bright days, when no sweating can occur, or applying the paint in warm paint rooms. It is safe to say that not in a single case out of the many skeleton structures of modern sky-scrapers can this be found to have been the procedure. There would seem to be no better possible assurance than all this of trouble ahead for coming generations.—Cassier's Magazine.

Power Lost in Transmission by Belts and Shafts.



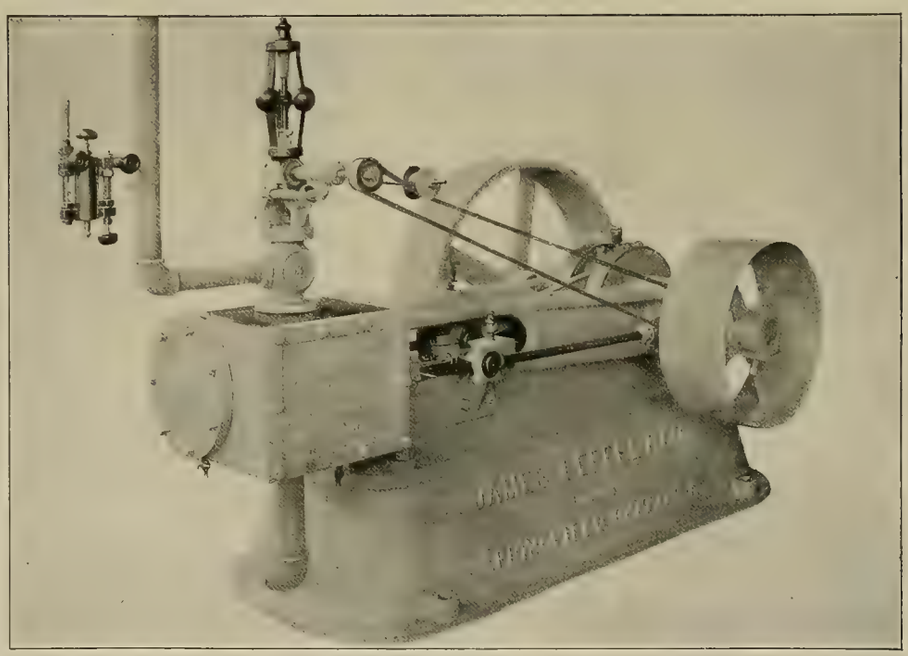
Prof. C. H. Benjamin, of the Case School of Applied Science at Cleveland, O., has recently made public his experiments in determining the loss of power through friction in the transmission by belts and shafting.

The observations were made in 16 factories, each engaged in a different kind of work. The method of making observations was as follows: During the daytime, when the works were in operation and the machines were running, indicator cards, showing the work being done by the engines, were taken each hour. Then during the noon hour or at night, when the engines were driving only the shafting, similar cards were taken, and when these and the first ones had been averaged the difference between the power required to drive the shafting alone and that required to drive the whole shop was found, and this reduced again to a percentage. The most startling loss was found in a bridge-material factory, where the shops were spread over a lot of ground. Eighty per cent of the engine's power was lost in the shafting there. In a planing mill the loss was 73 per cent; in a sewing machine factory it was nearly 70 per cent. It was 77 per cent in a stamping mill and 65 per cent in a boiler and machine works. The average loss for heavy machine shops was found to be 62.3 per cent. The average for light machine work was 55.1 per cent, and in but one instance did the loss fall below 47.3 per cent.

In this one case the percentage of loss was so small that it must serve as a serious commentary upon the character of the work generally done in putting up shafting. This was in a steel-screw works, and the loss was only 14.5 per cent. In this factory the machinery is all of the automatic type, very compactly arranged, and the shafting had been put up in the most careful manner. The shafting was in perfect alignment, and ran in hard cast-iron boxes without babbitt metal. It is supported by very rigid hangers, and was oiled by hand instead of wick oilers. The results of these observations were presented to the American Society of Mechanical Engineers, at its recent meeting, in a paper by Prof. Benjamin, and tables were given which showed the number of feet of shafting run in each of the factories under observation, and other features of the tests. One explanation of this immense loss of power, Prof. Benjamin says, is economy in either the quantity or the quality of the oil used. This cuts down the apparent size of the bills for shop expense, while the coal and water bills go piling up.

Double Cylinder Hoisting Engine.

The illustration represents an improved hoisting engine supplied by the Park & Lacy Co., 21 and 23 Fremont street, San Francisco, and specially designed for mine use, which is claimed to embody all the features necessary to the requirements of this coast. The valves are guaranteed to relieve, through the pressure plate, the strain upon the links usual in engines having unbalanced valves, and to be as easily reversed under steam pressure as when at rest. The guides are cast as a part of the drum and main shaft bearings, thus assuring perfect alignment. The crossheads are adjustable and fitted with brass slippers having broad wearing surfaces scraped to true planes, and steel crosshead pins. The connecting rods are made of hammered iron, polished full length, and fitted with selected hard brass boxings. The straps are held solid by bolts and are adjustable by means of hand-fitted keys. The main shafts are made of hammered iron, turned full length, and of proper size and length for drum duty. The drum shafts are made of steel, of ample diameter, and run in heavy anti-friction boxing. The brakes are of the post type, having sufficient resistance to hold the full weight of the load in suspension, and are operated by a foot treadle. On the clutch drum engine, as depicted in the illustration, the post brake is operated by a ratchet lever and additional brakes on the crank discs are provided, which are worked by a foot treadle located contiguous to the throttle valve. These engines are erected and tested under steam pressure, with brakes set, before shipment.



CLUTCH DRUM ENGINE.

Oxidizing Steel and Iron.

A great many parts of machinery are exposed to moisture and dampness, even if not directly to water. It does not always protect such pieces to paint them, but they can easily be fixed so that they will rust little if any if they be properly oxidized. A very good way is to make a mixture of nut galls and glacial acetic acid. After standing a while add a grain or so of nitrate of silver or copper sulphate to a small quantity of the mixture (say one ounce or so) and the solution is ready for use. Clean the surface of the metal with pumice stone, but do not use emery. Dry-air slack lime may be used after pumice stone, then cover the surface with liquid; let stand until covered with a coat of oxide. A scratch brush should then be used vigorously upon the metal and the coating, and standing repeated twice, twenty-four hours apart. After scratch-brushing the second time, clean the surface of the metal and rub with a little linseed oil and camphor.

New Standard Center Crank Throttling Engine.

The accompanying illustration shows a new pattern horizontal self-contained engine, designed and furnished by James Leffel & Co., Springfield, Ohio, who will send a descriptive catalogue upon application.

STANDARD CENTER CRANK THROTTLING ENGINE.

The builders of this engine state that they are prepared to adapt it for use as an automatic cut-off engine by dispensing with the throttling type of governor, and substituting an improved shaft governor of the automatic cut-off type on main shaft of engine, automatically varying the point of cut-off and amount of steam admitted to piston, to conform with the power being required and maintain the engine at its rated speed. This automatic governor is also adjustable for different speeds, and can be set to maintain a lower or higher speed than specified in table of standard dimensions, supplied by the builders.

A WORKMAN who was knocked senseless by an electric shock at the foundry of the Anaconda Copper Mining Company was resuscitated, after the usual expedients had failed, by removing his clothes, burying him in the foundry sand, except his mouth and nose, and thoroughly soaking the sand with a jet of water. The same experience happened to the same man twice.

Scientific Progress.

Ancient Metallurgy.

In the Anthropological section of the recent meeting in Liverpool of the British Association for the Advancement of Science, Dr. J. H. Gladstone spoke upon "The Transition from Pure Copper to Bronze Made with Tin." He said that copper was worked by the Egyptians in the Sinaiatic peninsula from the fourth to the eighteenth dynasty, perhaps from 5000 to 3000 B. C. At that period tools were made of pure copper in Egypt and Syria, and by the Amorites in Palestine, often on the model of flints. The efforts to make copper hard underwent three stages. The first was to get the copper to contain a large amount of cuprous oxide. The second was to mix it with arsenic and antimony. This was done by the Egyptians in the twelfth dynasty, and it was probably at first accidental, but one specimen had been found containing 3.9 per cent of arsenic, and this was probably a deliberately made alloy. Thirdly, it was gradually found that tin was the best metal to harden copper, but it was not so commonly found. Tin mixed with copper does occur before the bronze age, but only to a very small extent, ½ to 1 per cent. Afterward, as tin was more commonly found and became less expensive, it was more largely used, and so the bronze age was reached. In many parts of Egypt bronze tools and implements were found, and one specimen contained 9 per cent of tin. Prof. Flinders Petrie had found a bronze bar at Medum, in Egypt, in one of the small tombs belonging to the fourth or fifth dynasty. The brass of the early Israelitish period of the Bible was bronze. The immense amount of bronze used in ancient times, 5000 years ago, was astounding. The question as to where this large amount of tin was obtained is still unsolved.

BEFORE the British Association for the Advancement of Science, at the Liverpool meeting, Prof. W. Ridgway read a paper on "The Starting Point of the Iron Age in Europe." He said that the origin of the iron age is one of the most important points in European archæology. Scandinavia could not be its place of origin, for there the iron age began later than the Christian era. And it is admitted that the iron age came in per saltum in the Swiss lake dwellings, in Italy, Greece, France and Britain. Hellstadt, in Austria, was, in fact, the only place in Europe where articles of iron were found gradually replacing those of the same kind in bronze. Near the Hellstadt cemetery lay one of the most famous iron mines of antiquity. It was from this Austrian center that the use of iron spread into Italy, Switzerland, Gaul, Spain, Greece and eastern Germany, among tribes that were using bronze weapons and implements, and Tacitus was our authority on this point. In a discussion, Dr. Montelius pointed out that there were instances of the use of iron in Scandinavia, gradually superseding bronze, in the fifth or sixth century B. C. A. J. Evans said there is very early evidence of the use of iron in Syria, whence it spread to Greece, and the spread of iron in Britain was earlier than is generally supposed, as early, in fact, as the sixth century B. C., especially in Ireland.

THE reproduction of color now absorbs the attention of a large class of workers. M. Lippmann of the Sorbonne, Paris, says he has succeeded in obtaining pictures in color directly from the objects. A sensitive plate, of practically grainless coating, is attached to a tank of mercury in such a manner that the film and mercury are in absolute contact. The exposure is then made and the plate developed and fixed. Under certain conditions an image in colors is produced. This, however, is only visible at certain angles, just as the image in a daguerreotype, and the results cannot be said to give any encouragement to the idea that a practical process has been devised. Of more importance is the indirect method referred to above, by which a negative is made through a screen ruled in colors. From this negative a positive is made, which, when backed up with a ruled colored screen, yields a colored picture closely resembling the original.

THE question is often asked, Why is it that a person who is lost, whether it be in a dense wood or on a prairie, invariably moves in a circle, and always to the right? No satisfactory answer has ever been given for this well-known peculiarity under the circumstances mentioned. Some physiologists, anatomists, and speculative philosophers claim that the left leg in the human species is slightly longer than the right, and so takes longer steps, thus causing a motion to the right which in time completes a circle, if the mind is so bewildered that it has no fixed objective point in view. Perhaps the real answer to this queer question lies in the fact that most persons use their right hands in preference to the left, and are accustomed to passing objects on their right-hand side, and so, unconsciously, keep edging off to the right. On a prairie, however, where there is nothing in the way of obstacles worthy of mention, this cause or reason for walking in a "right-handed" circle would hardly hold good.

Electrical Progress.

A Great Water Power Project.

Public announcement has been made of a water-power project, which, in its magnitude, will surpass even that of the Niagara plants. The plan, according to an electrical contemporary, contemplates the development of 100,000-horse power by the diversion of a portion of the St. Lawrence river at the town of Messena, in St. Lawrence county, New York. It is proposed to create an artificial fall by diverting a portion of the stream to another channel, at a point where the topography is such that a canal less than four miles long will give a fall of about 50 feet. The Grass river flows parallel to the St. Lawrence, and the two are separated by a distance of only three miles. The Grass river discharges into the St. Lawrence at a point seven miles below Messena. In that distance the St. Lawrence falls about 100 feet, while the Grass river falls only 50 feet, so that at Messena the level of the latter is about 50 feet below that of the St. Lawrence. A canal about 3½ miles long will bring the St. Lawrence water to the bluff on the north bank of the Grass river, where it will have a sheer fall of 50 feet to the river below. The proposed canal will be 200 feet wide, and it is calculated will discharge 1,000,000 cubic feet of water a minute under a head of 50 feet. The cost of the canal, it is estimated, will be less than $1,000,000; and, according to the present plans, most of the power will be utilized on the spot in the operation of wood pulp mills and the calcium carbide plant.

THE Pioneer Electric Power Company of Ogden, Utah, has a set of castings consisting of one flange casting 6 feet 1½ inch internal diameter, two flange castings 4 feet 7⅞ inches internal diameter, one breeches pipe 6 feet internal diameter. The total weight of breeches pipe is 10,000 pounds, and of the flanges and breeches pipe 13,000 pounds. A stream of water flowing through a riveted steel pipe 6 feet in diameter, about one mile long, with a fall of 300 feet, is diverted by the breeches pipe into two streams, each 4 feet in diameter, leading to the power house. The casting is designed to stand a pressure of 200 pounds per square inch, and in reality will safely carry many times this load.

COMMANDER R. G. O. TUPPER of the English navy has been conducting a series of experiments at Portsmouth by which it was shown that by means of kites telegraphic communication could be established between ships of a fleet at considerable distances apart. The experiments were made by officers of the warships Daring and Dauntless. The end of a wire which the kite bore away from the Daring was dropped upon the deck of the Dauntless, where it was secured by the electrician of the ship and attached to a telephone apparatus in waiting. The other end, which had remained aboard the Daring, was also attached to a telephone, and as soon as this task was completed, the two ships were in perfect communication. The kite remained suspended, secured by two lines, for more than four hours, during which time communication between the Daring and the Dauntless was uninterrupted.

Practical Information.

Brass and Its Manufacture.

In taking up the price list of the American brass manufacturers we see the different headings, "rolled" or "sheet brass," which is generally known as "common or high brass," "brazing," "spinning" and "spring brass," etc., with the different prices per pound of these different grades of metal.

The brass which is ordinarily sold, unless otherwise specified, is known as common or high brass, and is spoken of as "rolled" and "sheet" brass, and consists generally of about 58 per cent of copper and 42 per cent of zinc. Looking farther down the list we see "brazing, spinning and spring brass" is worth one cent a pound more than common or high brass. This additional extra cent a pound is charged for the reason that this brass contains a little more copper than the high brass above referred to, the copper being the expensive part of the brass, and the price is generally directly in proportion to the amount of copper which enters into the composition of the metal, and this brass will generally contain about 60 per cent of copper and 40 per cent of zinc.

The next grade of brass is "extra quality" for brazing, spinning and a high class of spring brass. This is two cents a pound more than the common or high brass, and consists of about 62½ per cent of copper to 37½ per cent of zinc. The next, "low brass," is four cents a pound more than the common or high brass, and contains 66⅔ per cent of copper to 33⅓ per cent of zinc. Gilding brass, oreide and bronze are generally about seven cents a pound more than the common or high brass and contain anywhere from 70 to 90 per cent of copper, with the remainder zinc.

In all of these brasses a great number of mill men are using a small percentage of aluminum, as it makes the brass flow more freely and gives it additional fluidity, and also combines with the impurities in the zinc and brings them to the surface, thus enabling them to use poorer zinc than they would ordinarily use, and at the same time secure stronger and tougher metal. Aluminum is used to a small extent in sheet brass, and to a very large extent in brass castings. The best brass in the world is made in the United States, for the reason that we have within our borders the very purest of copper and the very best of zinc.—The Foundry.

Gold in the Ocean.

Seventy-five billion tons of gold lie in the ocean. This is the conclusion of Prof. Liversidge, of the University of Sydney, after nearly five years of experiment.

Dr. Wurtz read a paper on the subject before the American Association for the Advancement of Science as far back as 1866. Many persons have laughed outright at the assertion, others have found it interesting reading for a dull moment, and still others have ascribed to its originator wonderfully strong imaginative powers. Science hasn't, at any time, considered it seriously. Now, however, appears Prof. Liversidge, who says it is true. Moreover, the Professor has ascertained to a nicety how these seventy-five billion tons of gold are distributed in the waters throughout the globe. Month after month he confined himself in his laboratory, and there, with his delicate instruments and faithful chemicals, he wrung the story from the silent seas. He obtained specimens of sea water from various spots. Friendly ship captains brought him jars full from near and far. After his protracted labors, and when at last he has satisfied himself that he made no errors, he thus has unbosomed the results in his memoir:

"The amount of gold obtained from sea waters in my experiments must necessarily be less than the total amount of gold present in the water, since it was found that known quantities of gold chloride solution added to distilled and sea waters, and then estimated by precipitation, scarification and cupellation, showed a loss, and sometimes a very considerable one.

"All evidence is in favor of gold being present in sea water off the New South Wales coast in the proportion of about one-half to one grain per ton, or, in round numbers, from 130 to 260 tons of gold per cubic mile.

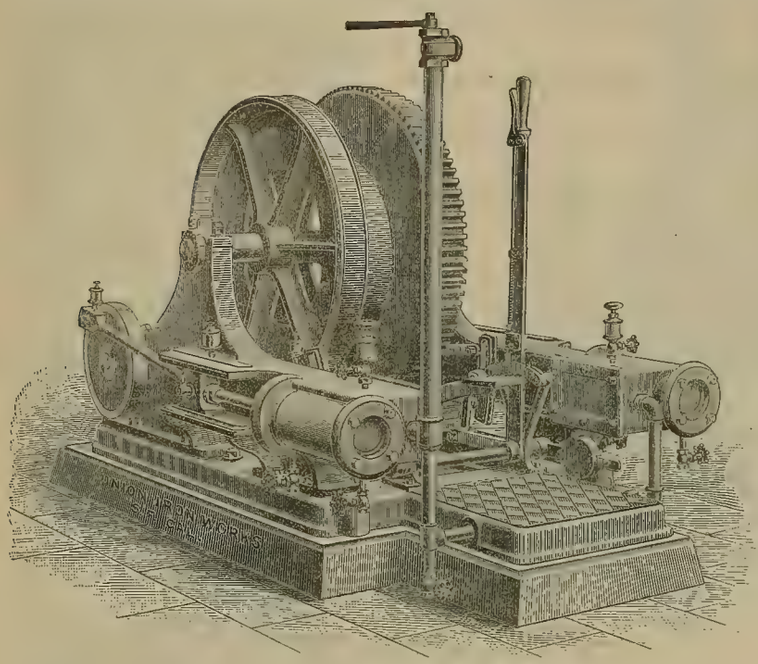
"This of course, means an enormous amount for the whole of the ocean, the cubic contents of which used to be put down at 400,000,000 cubic miles. If gold be uniformly present at the rate of one grain per ton, the total amount would be over 100,000,000,000 tons of gold.

"A later estimate is 308,710,679 cubic miles. This even would mean over 75,000,000,000 tons of gold."

There need be no fear however that the seventy-five billion tons of gold will be thrust upon an amazed world to derange financial systems and make the metal a glut.

There is no known method of profitably coercing the gold from its floating habitation. To all appearances it will lie in its restless security a long while before man's ingenuity will have devised a cunning way to wrench it without loss from the deep for his purposes. Only scientists, with their costly chemicals, can now do that, and the gold thus obtained is secured dearly.

MANY persons still believe that the instinct of animals preserves them from certain accidents, and that they never eat anything that is injurious to them. Well-instructed persons have long known that in this regard animals are no better off than men. A chicken does not hesitate to drink paint; a cow partakes of water in which bags containing nitrate of soda have been washed; ducks strangle and choke in swallowing snails. M. Giraud, a veterinary at Barnewitz, now notes a fact that merits the attention of poultry farmers. He has observed numerous cases of poisoning in ducks following their feeding on caterpillars, especially those of the cabbage moth; these caterpillars have been given to the fowls in mass or are found on the cabbage leaves furnished them for food. After from six to twenty hours, according to the number of caterpillars eaten, poisoning manifests itself by loss of appetite, great weakness, tottering steps, accompanied sometimes by symptomatic movements, finally by difficulty of breathing, and often death, after an agony of variable duration, during which the beak and claws grow pale.



NO OTHER iron range so far discovered possesses greater apparent reserves than the Mesabi of Minnesota. Conservative estimates formulated from the records of properties now exploited and worked, together with others determined by systematic explorations and analyses, show that the Mesabi range can supply ore (which will equal in average iron and phosphorus contents) double the quantity which the entire Lake Superior region has produced in fifty years. This means 200,000,000 gross tons. In this estimate there are not included a number of properties which have been imperfectly explored.—John Birkinbine in The Foundry.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

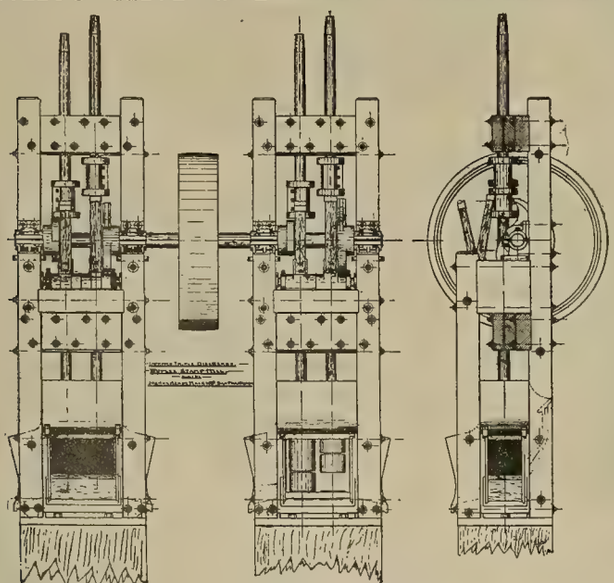
HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.



The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

Book Reviews.

The Tutorial Statics: The Tutorial Chemistry: These two octavo volumes of 270 and 225 pages respectively are from the University Tutorial Series and are admirably adapted for instruction, being applicable alike to the requirements of the teacher or student, and are also valuable as works for reference. The former discusses the laws of physics, mechanical forces, principles of virtual velocities, the laws of friction, the book requiring but a rudimentary knowledge of trigonometry to be of value to the unaided student; the latter of the two books takes up a systematic outline of the chemistry of the non-metals and is essentially a book for the teacher, though of manifest value in connection with laboratory practice. The books are published and for sale by Hinds & Noble, 4 Cooper Institute, New York; price of each, $1.

Monetary Systems of the World: This work, by M. L. Muhlman, deputy assistant treasurer of the United States, is of unusual value. Without any political or partisan prejudice the monetary system of this country is clearly and accurately explained, as well as the monetary system of every other nation on earth. The information in the book is merely a compilation, but is the condensed cream of many works, and so arranged as to be of value to a busy man who wants the undiluted facts. It is a vade mecum of modern monetary science. Published by Chas. H. Nicoll, 189 Broadway, New York; price $2.

Catalogues, Etc.

Leyner Drills, Air Compressors and Receivers: An illustrated description of the Leyner Rock Drill and Air Compressors, with sectional views, data, descriptions and testimonials. The machinery specified is manufactured and sold by the E. P. Allis Co., whose branch office is at 9 Fremont St., S. F. "Engines" is the title of another very handsome catalogue received from the same company, 185 pages of finely printed illustrations and descriptions of various styles of engines built by the company and installed throughout the country. On page 100 is illustrated the "St. Louis type" of vertical compound pumping engine, one of two built for the city of St. Louis, each being 72 feet in height and of a capacity of 30,000,000 gallons in twenty-four hours. Sundry forms of mining machinery also receive elaborate notice; on page 130 is portrayed the Reynolds steam stamp; one of these stamps in the stamp mill of the Tamarack Mining Co., Opechee, Mich., has a crushing record of 1920 tons of conglomerate copper rock in six days.

La Belle Gold Fields and Trinidad, the Gateway: The Gunnison Gold Belt, two superb brochures issued by B. L. Winchell of the passenger department of the Denver and Gulf R'y of Colorado, illustrate by contrast the apathy of California railroads in this regard. These handsome little books, like many of their predecessors, are admirably designed to attract attention to the mining wealth of Colorado and, incidentally, to secure increased traffic for the railroads. Statistical description and handsome illustrations combine to make a very attractive showing for the region described. The railroads centering in Denver aid and foster the mining industry of Colorado and are, of course, great gainers thereby, and deservedly.

Coast Industrial Notes.

—The Humboldt and Trinity, Cal., Toll Road Company proposes to build a wagon road from Mad river to Hay Fork, and have it built by next winter. Surveys are now being made.

—Seven carloads of brandy were shipped from San Jose to Philadelphia this week by the Naglee estate. The shipment was in casks and consisted of over 27,000 gallons. The brandy is from fifteen to twenty years old, and, at the present market value, is worth nearly $200,000.

—The Mill Valley & Mount Tamalpais Scenic Railroad Co. are considering the question of extending their road to Bolinas, on the Marin coast. The country that must be traversed by the new line is mountainous and the construction of the road will require considerable engineering skill.

—C. R. Lloyd of this city, the principal stockholder in the San Bernardino Electric Light Company, has bought the East Riverside, San Bernardino Co., Cal., water power and the connecting wires owned by the Electric Light and Power Company, adding 250 horse power to its capacity, and has made arrangements to connect with the wires of the Redlands Company at Colton, thus securing the benefit of 500 horse power, the surplus of that company. The purpose is to furnish motive power for street railroads and also power for the Santa Fe shops.

Obituary.

Prentiss Selby died at his residence in Oakland last Friday, aged 50 years. Mr. Selby was a son of the late Thomas H. Selby, founder of the Selby Smelting and Lead Works, and was born in New York. In the early fifties he came to California to join his father, who had preceded him, and when the smelting works were established at North Beach he took a position there and in time became superintendent, a position he occupied for a number of years. He retained a large interest in the company and took an active part in its affairs up to the time of his death. During his life Mr. Selby, while always a prominent man, was never connected with any public office.

Recently Declared Mining Dividends.

Ontario, Park City, Utah, $15,000; payable Jan. 30.

Centennial-Eureka, Utah, $30,000; payable Jan 21.

Morning Star Gravel Mining Co., No. 74, $4 per share.

Lelloi Mining Co., Rossland, B. C., $25,000; payable Jan 31.

Atlantic, Mich., Copper Mining Co., $1 per share, $40,000, Feb 10.

Boston & Montana Copper M. Co., $3 per share, $450,000, Feb. 20

The Pennsylvania Mining Company, Grass Valley, Cal., $5000; payable Feb. 1.

Alice Mining Co., Montana, $25,000; payable Jan. 19. This is a total to date of $995,000.

Homestake, Black Hills, South Dakota, $31,250; payable Feb. 25; a total to date of $6,118,750

Hecla Consolidated Mining Co., Glendale, Montana, $15,000; payable Jan. 25; a total of $2,160,000 to date.

The following will also pay dividends this month: Calumet & Hecla, $1,500,000; Quincy Copper Mining Co., $400,000; Gold Coin, $20,000; Osceola Copper Mining Co., $50,000.

The new year begins well with dividends in Utah. The Centennial-Eureka has already distributed $30,000, making a total of $1,890,000 to date, and Bullion-Beck $20,000, which advances its total to $1,967,000. Mercur paid out $25,000, which makes a total of $300,000, and Galena $5000, making a total of $71,000. South Swansea paid $7500 during the month, which made a total of $15,000, while the Swansea paid $5000 among its stockholders, who have divided $26,500 to date. The dividends by these companies alone for the month amount to over $100,000.

Personal.

F. KLEPETKO succeeds Thos. Couch in the general management of the Boston & Montana Co.

PROF. R. A. F. PENROSE and John Brockman, owners of the Pearce mine north of Bisbee, Arizona, are in San Francisco.

JOSEPH GRUSS and son George have gone to Australia, where Mr. Gruss will take the management of some mines for an English company.

MR. BERTRAM HUNT, the new local manager of the Gold and Silver Extraction Co. of America, has arrived, and assumed charge at the company's office in this city.

EX-JUDGE GEORGE TURNER, one of the heaviest shareholders in the Le Roi mine in the Trail Creek district, British Columbia, has been elected United States Senator from Washington.

MR. W. WESTON, mining engineer of Cripple Creek, has made a second examination of the White Hills (Arizona) Mining and Milling Company's property for British capitalists. He left Kingman on the 26th ult. on his way back to Colorado.

JOHN HAYS HAMMOND, consulting engineer for the Consolidated Gold Fields, Limited, will leave London next week for South Africa. His main purpose as to the mines controlled by his companies is to start more active working. His present intention is to remain but a short time before returning to London, after which he proposes to come out to the Pacific coast for a short trip.

GENERAL WILSON, who succeeds General Craighill as Chief of Engineers of the United States Army, has twice been detailed for work in California. On the occasion of his last visit he was engaged on the work of the Debris Commission on the Yuba and American rivers and made tours of inspection along the upper Sacramento and Feather rivers. He is familiar with all the conditions about the Bay of San Francisco.

THE OVERLAND LIMITED, VIA UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Hydraulic and River Miners Handling Boulders Can Easily Remove Them By Using

The Knox Patent Hydraulic Grapple.

IT WILL DO GOOD WORK AND GIVE SATISFACTION.

PRICE ACCORDING TO SIZE REQUIRED.

Address WM. KNOX, Jacksonville, Oregon, or JAS. ARMSTRONG, 10 Front Street, S. F., Cal.

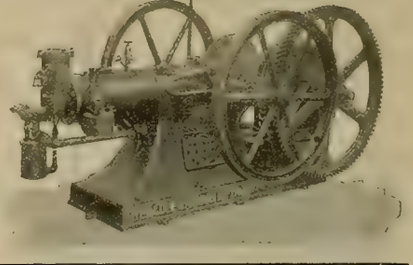
RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

HERCULES GAS, GASOLINE AND DISTILLATE ENGINES.

HOISTING ENGINES, 2 h. p. to 200 h. p. ✦ STATIONARY ENGINES, 1 h. p. to 200 h. p. ✦ MARINE ENGINES, 2 h. p. to 200 h. p.

Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running. Just ½ your expense SAVED BY USING A HERCULES in place of ANY other. We make no exception.



NEARLY 3000 HERCULES HOISTING, STATIONARY AND MARINE ENGINES IN ACTUAL USE. HIGH GRADE.

We claim full power, automatic and positive adjustment regulating speed and consumption of fuel in proportion to work being performed. No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.

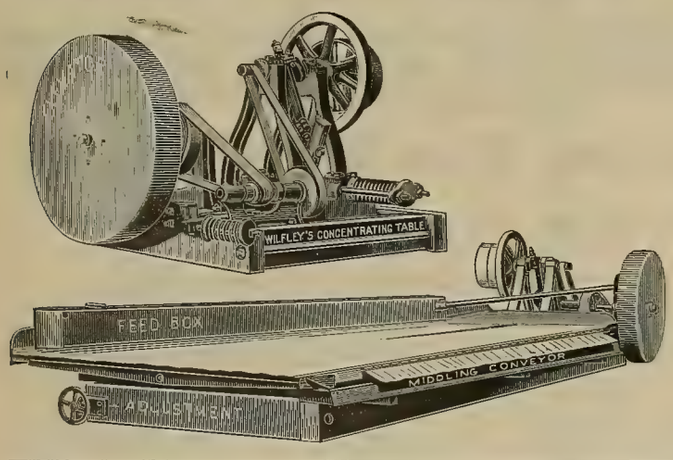
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.



Geo. E. Woodbury,
Manufacturer,
141 to 143 First St.
San Francisco, Cal.

PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st. prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

The Mine and Smelter Supply Co.,

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT PITTING AND SPREADING MACHINE.—James Harrison, Vacaville, Cal., assignor of one-third to James T. Foster of Berkeley, Cal. No. 575,896. Dated Jan. 26, 1897. This invention relates to a novel feeding mechanism, and means for pitting, dividing and separating the divided fruit, means for receiving and advancing the divided sections of fruit and spreading them upon the trays, and means for advancing the trays, and other details of construction and arrangement. It consists essentially of the combination of a vertically reciprocating knife for severing the fruit, forcing its pit out, a pair of auxiliary knives converging downwardly and movable with the main knife and adapted to enter the fruit from above, and means for engaging the upper portions of the auxiliary knives to separate the lower edges thereof, whereby the fruit is opened from its top downward, and the sections laid on their backs. In conjunction with this is an inclined shaking table adapted to receive the sections of fruit thus laid out and advance them down the incline, and a series of advancing trays adapted to receive the fruit sections.

DIE FOR MANUFACTURING CARDS FOR PHOTOGRAPHIC MOUNTS.—Paul J. Stuparich, San Francisco, Cal. No. 575,814. Dated Jan. 26, 1896. This invention relates especially to improvements in the dies for the manufacture of cards for photographic mounts, art panels, and other similar purposes. It consists of a card or base having an independent surface of roughened material, a central panel formed by removing a portion of the rough material and a previously formed hard rim disposed around the periphery of the panel so as to form upon the card when acted upon by a suitable brace, an exterior roughened surface, an interior panel and intermediate depressed channel.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 300 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

DEWEY & CO., 220 Market St., SAN FRANCISCO, PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

NOTICE TO ORE SHIPPERS.

By shipping your ores to us you can obtain the highest prices paid on competitive bids in the public market, together with a careful and accurate sample, as with our new mill and improved machinery we are able to give perfect satisfaction to all shippers. *Write for our Pocket Reference Book.* The highest cash price paid for gold bullion and old gold. Prompt returns.

STATE ORE SAMPLING COMPANY, Denver, Colo.

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 4, 1897.

Rains the past week have interrupted business by confining purchases to actual near-by wants. Bad roads in the interior prevent country consumers from coming to distributive centers, confining business to townspeople. It is stated that, with settled weather and better roads, trade will pick up and by the end of the current month largely increased orders will be coming to hand. There is a continued good movement by vessels to coast points and also to foreign ports in the Pacific. The general feeling with the trade is that values of about all lines of goods are bottom and there will be a gradual change for the better. Crop advices continue favorable. Unless there is some unforeseen unfavorable climatic change later on, California will have bumper crops of wheat, fruits and everything turned out on the farm and dairy. It looks now as if the call for farm implements will be the largest the coming season than for over half a decade. Rains and snow deposits cause a cheerful feeling in districts where there has for several seasons past been more or less shortage of water for extended mining operations.

Contrary to expectation, exchange on New York has strengthened. Why this is so it is past finding out. Several reasons are assigned. One is that large holders of idle money are sending it out of the State so as to avoid paying taxes, for assessment day is in next month; while another is that considerable is going to New York so as to get the better interest allowed by banks there. It looks as if the first reason is the true one, for it is a well-established fact that there is no very great demand for money for new ventures or otherwise until after the first Monday in March. The rates of interest are still in favor of borrowers giving gilt edge security, but lenders do not seem disposed to press for loans in this month. The export clearances of goods to foreign ports aggregate the past week over $800,000. These large weekly shipments add still further to the general ease here. New York mail advices state that many loans secured on sterling exchange will be paid off, owing to cheaper rates of money at the East. New York banks continue to adhere to a 2 per cent discount rate for call loans, but trust companies place funds at 1½ to 1¾ per cent. The inquiry in that market for funds is light, but an improvement is looked for soon.

New York Silver Prices.

NEW YORK, Feb. 4.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29¾	64⅞
Saturday	29 11-16	64¾
Monday	29 11-16	64⅝
Tuesday	29 11-16	64⅝
Wednesday	29¾	64¾
Thursday	29¾	64¾

	Copper.	Lead.	Iron.	Tin.
Friday	12 00	3 07½	11 00@13 00	13 65
Saturday	12 00	3 07½	11 00@13 00	13 60
Monday	12 00	3 07½	11 00@13 00	13 40
Tuesday	12 00	3 15	11 00@13 00	13 45
Wednesday	12 00	3 15	11 00@13 00	13 50

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	20c Prem
New York Telegraphic Transfer	22½c Prem
London Bankers' 60 days	$4.86¼
London Merchants	$4.85
London Sight Bankers	$4.88½
Refined Silver, per oz., 1000 fine	64¾
Mexican Dollars	51½@52

SILVER.—There is a continued steady demand. For over one month there has been a better export movement than ruled at the corresponding time last year. This increase has not been confined to this city alone, for New York advices are to the effect that shipments show quite a gain. The movements, so far as we are advised, have been on legitimate business lines and in no way of a speculative character. If it is true that there has been an absence of speculative buying, then the situation looks healthy.

MEXICAN DOLLARS.—The market is extremely quiet, but this always obtains during Chinese New Year's holidays. This lasts about fifteen days.

ANTIMONY.—Our market is quoted at 7⅛@8c in a jobbing way. New York mail advices quote 7½c for Cookson's, 6¾@6⅞c for Hallett's and 6½c for Japanese.

QUICKSILVER.—A sudden jump of 5s in London caused an advance to $37.50 in our market and at New York to $37 to $37.50. The demand is quiet.

The market is quoted as follows:

Domestic trade, per flask	37 50

For export, quotations are nominal but less than for home.

BORAX.—The outward movement seems to be increasing.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

COPPER.—The general situation is quite bullish and indicating that the markets at home and abroad will move to still higher figures. The exports in last month aggregate larger to Europe than in January, 1896, which strengthens the conviction that the consumption abroad is not decreasing, but rather increasing, and even with a larger production it will tax producers to meet requirements.

The local market is quoted as follows:

Ingot, jobbing	14¼@—
Ingot, wholesale	—@13½
Sheet copper	—@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c

LEAD.—The market has strengthened again at the East, moving this time to a higher range than for many months. The action of the market looks as if a bull campaign has been inaugurated abroad in tin, lead and copper.

Our market is quoted in jobbing lots as follows:

Pig	3 75	@	3 85
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a moderate demand.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes,	"	"	1 45
Buck, Balls and Chilled, do.	"	"	1 45

TIN.—Pig advanced and then shaded off, only to recover towards the close. For plate the local market is irregular, with quotations for American hard to get correctly. The consumption of pig is increasing at the East and abroad, and with decreasing stocks the markets are strong.

We quote as follows:

Pig, per lb	14¼c	@	—
Plate, I C coke, heavy, per box	$4 05	@	—
" " " light, "	3 95	@	—

IRON.—The market is well supplied with spot, but to arrive the supply is said to be small. At the East there seems to be a steadier feeling. Exports of Southern to Europe are still large. From the Bulletin of the American Iron and Steel Company we excerpt the following:

"The American Iron and Steel Association has received from the manufacturers complete returns of the production of pig iron in the United States in 1896, and also complete returns of the stock of unsold pig iron in hands of makers or their agents at the close of the year. The total production of pig iron in 1896 was 8,623,127 gross tons, against 9,446,308 tons in 1895, 6,657,388 tons in 1894, 7,124,502 tons in 1893, 9,157,000 tons in 1892, 8,279,870 tons in 1891 and 9,202,703 tons in 1890. There was a great shrinkage in production in the last half of 1896, but in the twelve months embracing the last half of 1895 and the first half of 1896 we made 10,334,986 tons of pig iron. This large production was due to the boom of 1895. A greatly decreased production in the last half of 1896 was due to the reaction from that boom and to the uncertainty and apprehension attending the Presidential campaign of that year. The production of Bessemer pig iron in 1896 was 4,654,955 tons, against 5,623,695 tons in 1895, a decrease of 968,740 tons. The production of basic pig iron in 1896 amounted to 336,403 tons, distributed as follows: New England, New York and New Jersey, 22,692 tons; Allegheny County, Pa., 168,095 tons; other counties in Pennsylvania, 51,768 tons; Virginia and Alabama, 73,680 tons, and Ohio and Wisconsin, 20,244 tons. The production of charcoal pig iron in 1896 was 310,244 tons, against 225,341 tons in 1895, an increase of 84,903 tons. The production of spiegeleisen and ferro-manganese in 1896 was 131,940 tons against 171,724 tons in 1895. The stocks of pig iron which were unsold in the hands of manufacturers or their agents on Dec. 31, 1896, and which were not intended for their own consumption, amounted to 847,686 tons, against 705,847 tons, which were similarly held on June 30, 1896, and 58,132 tons on Dec. 31, 1895."

AMERICAN.	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—Imports the past week were mostly from coast points. Foreign coals continue steady. If crop prospects continue good, more offerings will be made for shipment in the spring months. There is no cannel in market.

We quote as follows:

SPOT FROM YARD—PER TON.			
Wellington	$8 00	@	—
Greta	6 00	@	6 50
Nanaimo	6 50	@	7 00
Cumman	5 50	@	6 00
Seattle	5 50	@	6 00
Coos Bay	—	@	5 00
Cannel	8 00	@	—
Egg, hard	12 00	@	13 00
Wallsend	—	@	6 50
TO ARRIVE—CARGO LOTS.			
Australian			5 50

Mining Share Market.

SAN FRANCISCO, Feb. 4, 1897.

Under the lead of Con. Virginia the market fluctuated the past week from 5 to 10 per cent, closing yesterday afternoon at a slight advance on the lowest price of the week. Con. Virginia sold down to $1.90 and then recovered yesterday to $2.10 and $2.15. At the declining prices there was a good deal of stocks reported to have come out from outside holdings. Their selling, it is said, was due to a gradual shrinkage in values and fears of another line of assessments being levied at an early day. These assessments, the MINING AND SCIENTIFIC PRESS asserted in December last, were inevitable, and therefore to the informed is not cause for surprise. While there has been buying from stronger parties, yet there is nothing, so far as surface indications go, to warrant the belief that it is by insiders—those capable of promoting and sustaining a good-sized deal. The buying seems to have been done largely by shorts filling and two or more small outside pools. The latter are always content with a small profit and therefore sell whenever possible on a small bulge in prices. On more than one occasion we have asserted that the shares of the Comstock and other mines listed on the two exchanges are only worth for investment the ore in sight, with a reasonable per cent added for prospecting work that is being done. All over these prices is largely fictitious and dangerous to operate at. At this writing there are two points which deserve watching for near-by results, but there are others which will do to watch later on. These two points are the upraise in Con. Virginia from the 1650-foot level and at the long west crossdrift that is being run jointly by Confidence, Challenge and Con. Imperial. In the Bodie district the work reported by Standard seems to grow in interest. This company has commenced to overhaul their mill with the view of making thorough repairs and adding the latest improved machinery, so as to make it the most complete and best equipped milling property on this coast. The consolidation of the companies heretofore mentioned is nearly complete, for over 90 per cent of the old shares have been redeemed, canceled and new shares issued.

It is worthy of regard that the Chollar-Brunswick ore which is being milled at the Nevada mill shows honest management and reflects credit on the company. In substantiation of this, we take the following from the last official letter: "From all points (Brunswick lode) have saved and shipped for the week 113 tons and 1800 pounds of ore; average car sample assay: gold $31.57, silver $18.69 per ton. Wagon samples: gold $27.28, silver 19.19 ounces. Battery samples, average for the week: gold $35.02, silver 18.22 ounces per ton." It will be seen that the gold battery assays are higher than the other two assays.

The following companies report cash on hand February 1: Alta $3139, Andes $1478, Alpha Con. $3005, Best & Belcher $544 (with $2500 due to the bank), Bullion $298, Caledonia $3046, Chollar $1731 (with $7000 due the bank on a note), Challenge Con. $2051, Con. Imperial $620, Confidence $2027, Con. New York $451, Con. California and Virginia $16,980, Crown Point $4729, Exchequer $2674, Gould & Curry $9468, Hale & Norcross $2265, Mexican $6286, Occidental Con. $1067, Overman $6148, Potosi $6630, Savage $12,324, Sierra Nevada $5968, Segregated Belcher $516, Silver Hill $49, Standard $38,370, Syndicate $870, Union Con. $8090, Utah Con. $463.

The Belcher Mining Company reports an indebtedness of $801 and the Lady Washington one of $1040.

The work reported by the leading mines on the Comstock is practically unchanged, but at several points it grows interesting, yet this may be only a repetition of similar prospects in years gone by; and while the favorable indications may not fill, yet it is to be hoped they will for the good of the share market. In Utah they continue to find stringers of quartz on the level heretofore reported. In Sierra prospecting work is continued on the Layton tunnel level; no change in formation. In Union they are still prospecting the 900-foot level. The north drift was, at last advices, in porphyry with seams of gypsum, which shows some value. In Mexican they are still extending west crossdrift No. 2 on the 1000-foot level. In Ophir work is confined to the Central tunnel and 1000-foot levels. Indications are said to be more favorable. They raise a few tons of about $30 ore each week from the former level. In Con. Virginia work is largely confined to the 1000-foot, 1650-foot and 1750-foot levels. The upraise from the 1650-foot level to connect with the 1550-foot level is being closely watched. There are many who look for good results, while others again think they will not find much of an improvement over that already reported. Best & Belcher and Gould & Curry continue joint work to the east on the 800-foot Bonner shaft level. Fairly active work is being done by Savage on the levels heretofore published. In Hale & Norcross prospecting and dead work is confined to the 900-foot level. No work is being done by Chollar. In Potosi they are exploiting the old tunnel level. There is a possibility of finding, before long, enough ore to extract and mill. Bullion continues to push ahead the north drift from the 500-foot shaft level. It was started 2170 feet in to the west. No change is reported in Alpha workings. The joint west crossdrift of Confidence, Challenge and Con. Imperial is in softer formation, which admits of better

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

Mine well developed. Complete working plant. Situation and facilities first class. Address H. D. RANLETT, Ranlett, Amador County, Cal.

progress. They expect to strike the west lode about 100 feet farther on. In Confidence the work is unchanged, as is that in Yellow Jacket, Crown Point, Belcher, Seg. Belcher, Overman and Alta.

On the Brunswick lode interest centers in Chollar, where they are working on the 200-foot, 300-foot, 400-foot and 500-foot levels. This work seems to be largely done for the purpose of extracting ore found on the first four and also developing the 500-foot to strike its downward continuation. They raise and mill each week enough ore to pay current expenses. In Occidental they are working on the levels heretofore published, without any material change in formation. Joint work is being done by Con. Virginia, Best & Belcher and Gould & Curry to develop the 300-foot level. They were putting in a chute at last advices.

COLORADO'S GOLD FIELDS.

Millions Upon Millions of Dollars in Gold Have Been Added to the World's Wealth.

It is a well-known fact that the richest and most famous gold mines in the known world are those of Colorado, many of which are paying to fortunate investors millions of dollars annually in dividends Some shrewd persons who invested only a few dollars are now receiving hundreds and thousands in profits, and, judging from present indications, there are more desirable chances to invest just now than ever before. New mines are discovered daily and old ones strike richer veins of gold.

In order to meet the great demand for reliable information about mines and mining camps, one of Denver's oldest and best known publishers has just issued a handsomely illustrated book accurately describing every mining camp in the entire State of Colorado, giving scores of truthful photo-engravings of famous mines, mountains, cities, etc. Cripple Creek, the world's wonder, is fully described; also a correct map of the district. Narratives of how many poor people have become wealthy by judicious investments in gold mines, and sketches of former prospectors who are now fixed for life. Tells how to avoid unscrupulous brokers and sharpers. The volume has been carefully compiled by a disinterested author and every statement made is guaranteed to be true. All terms and phrases of miners fully explained; tables showing the State's production of gold and silver for 35 years past. The publisher will send by return mail a copy of the above great book upon receipt of 25c. (currency or stamps), which also includes a 3-months trial subscription to his big 56-column weekly family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado (established 1890). Clubs of 5 and 5 books, $1. The paper contains each week all the latest mining news and illustrations of Rocky mountain scenery, also true stories of love and adventure Cut this out. Address as above and mention The Press when you write. It is reliable.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & CO., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

DELINQUENT SALE NOTICE.

HARTMANN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Chili Gulch District, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 22nd day of December, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
C. E. Stephens	2	3,000	150 00
H. Otersoen	6	2,500	125 00
J. P. G. Harrell	10	2,000	100 00
C. B. Schofield	14	2,000	100 00
C. C. Shepardson	9	3,390	169 50

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of December, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 46, No. 4 Montgomery street, San Francisco, California, on TUESDAY, the 23d day of February, 1897, at the hour of 5:30 o'clock P. M of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

G W. PEER, Secretary.

Office—Room 46, No. 4 Montgomery street, San Francisco, California.

ESTABLISHED 1860.

DEWEY & CO.

Patent Agents,

220 MARKET ST., SAN FRANCISCO.

Reliable Advice.

Quartz Mine Owners.

A Competent, Reliable and Experienced Mining Superintendent Wants Position.

Twenty years' practical work as superintendent of quartz mines in California and Nevada. Satisfactory references. Address Box 39, this office.

WANTED.

A young man, bookkeeper, competent to take charge of a general merchandise store, seeks engagement with a mining company, or would like to hear of some mining camp where he could open a store for own account.

Address A. H., this office.

WANTED — A POSITION

By a practical mining engineer as superintendent of a gold or silver and lead mine. Twenty years' experience in mining, milling and concentrating gold, silver and lead ores in California, Nevada, Utah, Idaho, Montana and Colorado. Highest recommends from leading mining companies in above States. Would like to sign a contract for two or more years to go to Mexico or South America. Address "Practical Engineer," Box 21, Mining and Scientific Press office, San Francisco, Cal.

HYDRAULIC MINER.—A practical hydraulic miner of 20 years' experience now open for engagement. Experience as superintendent and foreman in California and British Columbia. Understands ditch surveying and fitting up mines. Address HYDRAULIC MINER, care this office.

Assessment Notices.

MINERAL HILL MINING AND SMELTING CO.—Location of principal place of business, San Francisco, California; location of works, Spenceville, Nevada County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of January, 1897, an assessment (No. 1 of 10 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 210 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 25th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—210 Sansome street, San Francisco, California. Office hours from 1 to 3 o'clock P. M.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of January, 1897, an assessment (No. 5) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 327 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 8th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—327 12th street, San Francisco, California. Office hours from 1 to 3 o'clock P. M.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 13th day of January, 1897, an assessment (No. 5) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 25th day of January, 1897, it was resolved that any stock upon which the assessment shall remain unpaid on the 24th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 21st day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of January, 1897, an assessment (No. 61) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 23d day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room No. 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1897, an assessment (No. 43) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3th day of March, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 31st day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

E. E. BURLINGAME'S ASSAY OFFICE AND Chemical Laboratory. Established in Colorado, 1865. Samples by mail or express will receive prompt and careful attention. Gold and silver bullion refined, melted and assayed or purchased. Address 1736 and 1738 Lawrence Street, Denver, Colo.

WANTED.—Foreman to run a copper blast furnace, oxidized ores, in West Australia. Salary $175. Expenses out paid. One year engagement. Address ALFRED ROPP, Selby Smelting Works, Selby, Cal.

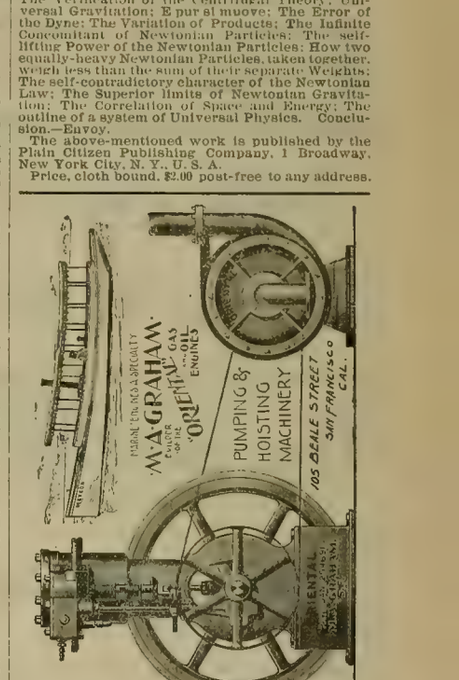
For Sale at a Bargain.

One new GOLD KING AMALGAMATOR—never used. Apply to Marshutz & Cantrell, N. W. corner Main and Howard streets, San Francisco, California.

The New York Herald in its issue of January 3, 1897 devoted nearly a whole page to a notice of the undermentioned work which it described as being "A Remarkable Scientific Memorial. It also stated that "Nothing more revolutionary than Dr. Endress's memorial has been advanced in the name of science since the day when Sir Isaac Newton presented to the Royal Society his doctrine of universal gravitation.

The Argentaurum Papers,

No. 1.



Some Remarks Concerning Gravitation.

By STEPHEN H. EMMENS.

CONTENTS.—Foreword: The Newtonian Doctrine; The Defect of Newton's Proof respecting the Centre of Force of a Spherical Shell; The Newtonian Demonstration respecting the Attraction exerted by Spheres upon External Bodies; An Inquiry as to the Reason of the Defect in the Newtonian Doctrine of Attracting Spheres having remained undiscovered until now; The Newtonian Doctrine of Internal Attractions; The Doctrine of Gravitating Centres as distinguished from Centres of Gravity; The Calculus of Gravitating Centres; The Gravitating Centre of a solid, homogeneous Sphere with relation to external bodies; The case of a Spheroid; The Precession of the Equinoxes; The Density of the Earth; The Internal Attractive Force of a Spherical Shell; The Internal Attractive Force of a Solid Sphere; The status of a Solid Sphere with regard to Internal Pressure; The Centrifugal Theory of Cosmical Bodies; The Variation of Density as regards the Earth's Crust; The Significance of Earthquakes; The Temperature of the Earth; The Source of Terrestrial Heat; The Source of Solar Heat; Saturn and Jupiter; The Volcanic Character and Quiescent Status of the Moon; The Obliquity of the Ecliptic; Elevation, Subsidence and Glacial Epochs; The Cooling and Shrinking of the Earth's Crust; The Arch Theory of the Earth's Crust; The cause of Ocean-beds and Mountains; Terrestrial Magnetism and Electricity; The Presence of Gold in the Ocean; The Verification of the Centrifugal Theory; Universal Gravitation; E pur si muove; The Error of the Dyne; The Variation of Products; The Infinite Concomitant of Newtonian Particles; The self-lifting Power of the Newtonian Particles; How two equally-heavy Newtonian Particles, taken together, weigh less than the sum of their separate Weights; The self-contradictory character of the Newtonian Law; The Superior limits of Newtonian Gravitation; The Correlation of Space and Energy; The outline of a system of Universal Physics. Conclusion.—Envoy.

Price, cloth bound, $2.00 post-free to any address.

Assaying Gold

.....AND.....

Silver Ores.

A Standard Work.

THIRD EDITION JUST OUT.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth, 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

RISDON IRON WORKS,

Office and Works: Cor. Beale and Howard Streets, San Francisco, Cal.

READ WHAT MINERS THINK OF THE BRYAN PATENT ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1898.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to silming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

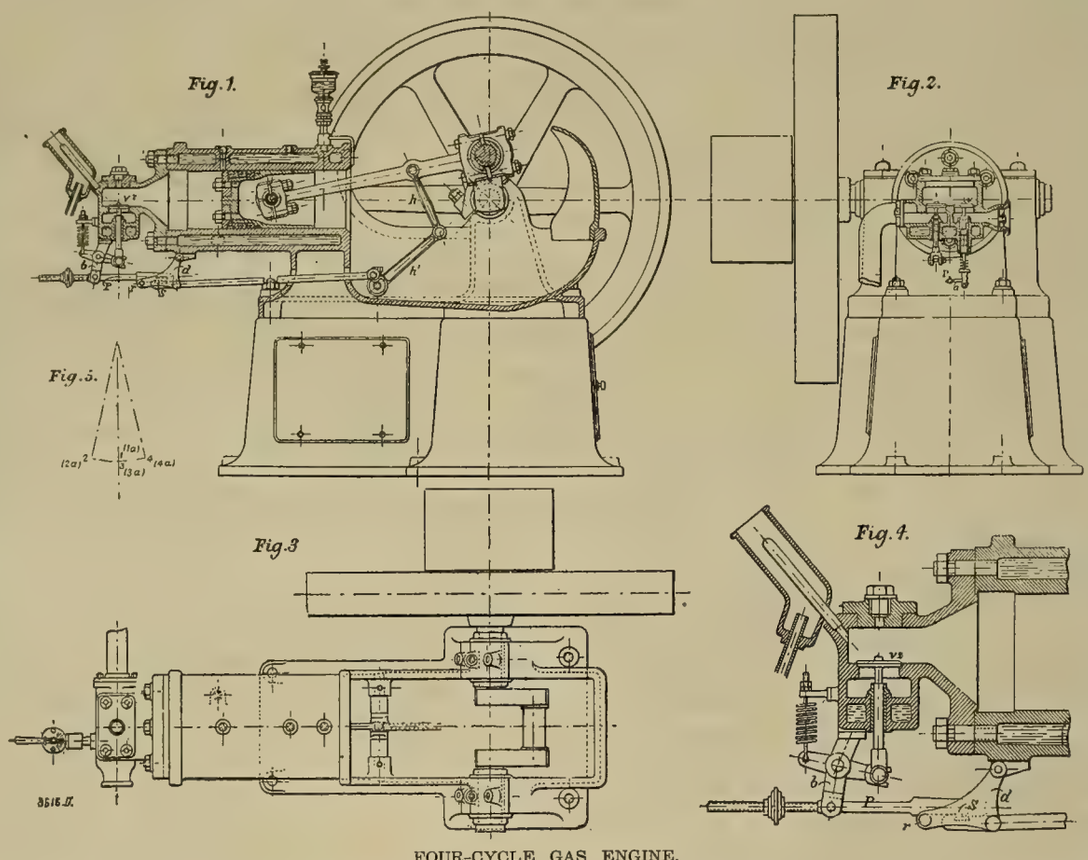
MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.



No. 1910.—VOLUME LXXIV. Number 7. SAN FRANCISCO, SATURDAY, FEBRUARY 13, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Successful Inventor.

After over thirty years of remarkable effort, A. B. Bowers has at last succeeded in securing absolute and undisturbed control of his patents for the famous hydraulic dredge to which he has devoted so much of his life and inventive genius. Last month the U. S. Circuit Court of Appeals rendered a decision confirming his claims to the original invention of the machine which has so long been a subject of litigation.

The fact that the invention itself was of immense practical value led to innumerable infringements and counter claims, and his success in devising such a machine caused a lifetime of warfare against those who combatted his claims to priority in that direction. Mr. Bowers has shown unusual tenacity and perseverance. No amount of financial embarrassment checked him in the steady prosecution of his suits. During the last ten years nearly everything began "coming his way," and he is at last in a position to dictate terms and acquire entire control of all that he has substantially claimed through all those years of struggle. The MINING AND SCIENTIFIC PRESS has in the last thirty years given so much prominence to his invention, and the progress of the litigation attendant thereon, that no more than the briefest chronicle of his final success is necessary. His career illustrates the trials of the even successful inventor: seldom have such trials resulted in so triumphant a result. In a two-page article written by him for this paper, and which appeared in our issue of Sept. 4th, 1880, Mr. Bowers discussed the troubles of inventors. That date was about his darkest hour; yet without impatience or bitterness he discussed the tendency to decry and belittle the projects of beneficial inventors, and hopefully writes: "These patient, persistent, investigating workers have a strange habit of succeeding at last. There are men who down at no one's bidding. They work on until they reach the ear of men of nerve and men of means, who are willing to listen and competent to judge, for there are such men who reason in this wise: This man appears to be moderately intelligent. There is about him no apparent evidence of insanity or imbecility. He has devoted much time and some money to the investigation of his subject and claims to understand it. After all this investigation it would be strange if he had not learned something. He may have hit upon something valuable. Such things have happened and may happen again. This would seem to be a reasonable view of the matter; but those who take this view are rare, and it is hard to find them. Great persistency, therefore, is necessary on the part of those who want to accomplish anything, however important, for which they, themselves, have not the requisite means."

Nearly seventeen years ago those words of Mr. Bowers, written in the shadow of struggle, appeared in this column, and now in the sunshine of his victory they appear prophetic.

FOUR-CYCLE GAS ENGINE.

BULLETIN No. 3 of the Minister of Mines of British Columbia—a report by William A. Carlyle, the provincial mineralogist, on the Slocan, Nelson and Ainsworth mining districts of West Kootenay—has been issued. The work done by the Government as to the new mining districts of British Columbia, while not elaborate nor very thorough, owing to the large ground to be covered, is timely and of value. The amount of gold and silver produced from the Kootenay mines, when it is considered that it is a new and comparatively undeveloped district opened up within a little over two years under great difficulties as to transportation, climate and rebellious character of the ores, speaks wonders for the future prospects of the country. This year promises to show a greater advance than ever, for many new and large mines are becoming producers.

Four-Cycle Gas Engine.

A. Borsig, of Berlin, shows at the Berlin Exhibition a four-cycle gas engine, noticeable, says the *American Manufacturer*, from the absence of toothed wheels or eccentrics. The general appearance of the engine, as shown in Figs. 1 to 3, follows the usual lines, but the valves are worked by a kind of radial gear $h\,h^1$, the principle of which is illustrated in Fig. 5, the diagram being from our Pittsburg contemporary. The path 1, 2, 3 of the die or catch s corresponds to the suction period; the path 3, 4, 1 to the compression period; the path $1a$, $2a$, $3a$ to the expansion period; and the path $3a$, $4a$, $1a$ to the period of exhaust.

During the period of suction, first cycle 1, 2, 3, the pendulum pawl P is lifted by the lateral projection a (Fig. 2) of the suction valve v; when the valve closes, P slowly falls back to be caught by the die s; on the path 3, 4, 1, s runs, therefore, idly. On the path $1a$, $2a$, $3a$, s slides under the corresponding edge of P, opening the exhaust valve v^2 while it follows in the path of $3a$, $4a$, $1a$. Thus the four-cycle is completed.

When the motor exceeds its speed, the pendulum pawl P is, by the action of the roller r of the suspension link d, thrown up too high, and falls in too late, missing s. The exhaust valve then remains closed; the expended mixture is once more compressed and expanded, and this play is repeated until the motor has regained its normal speed. Then the pendulum pawl will again act, the exhaust valve will be opened, the exhaust will escape, and suction again take place on the up-stroke, after which the normal conditions will continue.

At this time when the industrial world is giving so much attention to the subject of gas engines, the foregoing description, although brief, is particularly interesting. It seems that this type has several new features.

THERE have been in California within the past two years a number of engineers and owners of gravel mines in Russia looking into the methods in vogue here, and it is probable that within a very short time there will be a great change in the manner of working gravels in Siberia and the Caucasus. So far most of the mining has been done in a very crude way and at unnecessarily heavy expense for labor.

MISCELLANEOUS.—Concentrates, 131. Outline of the Geology of California with Reference to Its Mineral Deposits; California Deep Mining; Care of the Transit and Methods of Work, 132. The Coal Fields of Esmeralda County, Nev.; Deep Shafts, 133. Coast Industrial Notes; Personal; Commercial Paragraphs; Recent California Mining Incorporations; Recently Declared Mining Dividends, 139. Books Received, 147.

IN its issue of the 3rd inst. the greatest authority on advertising in this country says: "Many advertisers never learn that that which will pay them best may not be that which they like best. The best advertisers are those who cast prejudices and preferences aside, and utilize those methods which most effectively influence the public."

THE mineral land bill seems doomed to fail of passage by Congress at this session. But a few days remain and much business is before the House, and unless just pressure can be brought to bear upon the Speaker, and immediately, there is little hope of success. If it does fail, its passage at the next session will be of little value, for the lands in question are being so rapidly patented that there would be little work for the commission.

The Chinese and the Mines.

There has been considerable increase of late in the agitation against Chinese immigration in British Columbia. In Eastern Canada there is growing up more sympathy for the movement and petitions are being signed in Toronto, Montreal and Ottawa asking that a tax of $500 per capita be imposed on Chinese coming into the country. The greatest evil done by this nationality, from the standpoint of those interested in the mining industry, outside of the harm done to mining laborers, is through their taking up and working gravel mines and shipping the gold product out of the country. This they do, too, without making any large investments or doing development work that will be of lasting value or tend to improve the industry.

In California the Chinese have never been known to develop mines on a large scale or expend money that will be of value to the mining or other industries. Chinese miners' names are not on the books of the machinery and supply men of San Francisco. Yet, for the number of men of that race engaged in mining, probably they take out as much gold as do the whites.

Along the rivers and creeks of California, where there is auriferous gravel, particularly in Trinity, Siskiyou, Plumas and Placer, may be seen hundreds of Chinese working with small sluices, rockers or pans, upon ground that belongs yet to the Federal Government. They are squatters upon the public domain—aliens who, when they have gathered a few hundreds, will return to China.

Under the laws of the United States no one but a citizen, or one who has declared his intention to become one, may locate a mine. It has been suggested that the State Legislature pass an act providing some penalty for the working of mines that are not located. The enforcement of such a law would preserve these mines that, if not exhausted by the Chinese, would in time afford means of livelihood for part of our increasing population.

The Debris Bills.

An attempt is being made to show that there is asked from the California State Legislature for restraining dams and for dredgers nearly double what is really asked. There is now $250,000 in the State treasury appropriated by an act of March 24, 1893. To make this available the Legislature must amend the present law. Governor Budd pointed this out in his address to the last convention of the Miners' Association, and Controller Colgan, in a letter last Wednesday to Mr. Soward, author of the bill for the re-appropriation of the money, says that no part of this appropriation has been drawn from the State treasury, and the entire amount remains therein unexpended. He continues: "There appears to be no limitation as to the life of the appropriation. The only conditions surrounding it are that no warrant against it may be drawn or paid until the United States Government shall have appropriated an equal amount for a like purpose, and that the money is to be paid only upon orders drawn by the Controller upon the written request of the Debris Commissioner, and only for payment of not more than one-half of the cost of construction of works for restraining and impounding mining debris. It follows, therefore, that unless the law is amended or the office of Debris Commissioner is continued in existence, the appropriation could not be used, as no legal demand could be made upon the Controller."

And yet in the face of this it is claimed that $550,000 is being asked from the State.

There is being asked $300,000, and only that from this Legislature for caring for debris. As to this which is for dredging the Sacramento, it is urged that such work is the duty of the Federal Government. That is true, but the Federal Government refuses to act, and unless the State steps in, much more damage will soon be done than would be represented by the amount asked for.

However, California has had a good lesson from the appropriation of 1893 of the $250,000 for impounding dams. That was not so much proper work for the Federal Government as the dredging of the river, yet when the Legislature made the appropriation conditional upon a like appropriation from Congress, there was found little trouble in obtaining it.

If the State Legislature will now make the proposed appropriation of $300,000 for the dredging, there can be little question that Congress will do more in the future than it would if the bill fails to pass. In that way, from a financial point of view, it is safe to say that the State could make no better investment. An increased expenditure for the Sacramento river on the part of Congress will mean increased attention to the other needs of California in the way of caring for rivers and harbors.

The English Promoter.

Some time ago mention was made in these columns of a case of over-capitalization of a mine in Montana on the London market. For the stock £150,000 was asked, and of this £130,000 was to go to the vendors, promoters, etc., and £20,000 was for working capital on a mine without a mill or machinery and only £32,500 in ore in sight. Lately some Englishmen obtained an option on the War Eagle mine, in the Trail Creek district, British Columbia. The price was $1,000,000, or a little less. They failed to take the property, which has since been sold to a Canadian syndicate for about $800,000.

But the prospectus issued by the company formed in London—the War Eagle Mining Company—to take over the property called for £500,000, or nearly $2,500,000, for the vendors. This may be called a case of over-capitalization with a vengeance, or barefaced robbery. The War Eagle was well-developed, and the owners were not forced to sell nor desirous of selling unless they got a fair price. It is safe enough to presume that the mine was not worth more than they asked. Yet these London promoters calmly added 150 per cent to the price and made up a prospectus to fit a mine worth two and a half millions.

Had the London public been taken in, they would never have thought of blaming their own people, the promoters, but would have called down maledictions on the rascally Canadians.

Most of the trouble about the Australian mines has been caused by the greed of promoters in London, and yet Australians are the ones to suffer in the end from want of confidence on the part of capital in their properties. It is often asked why English capital is not more anxious to seek investment in California mines or properties in other old mining districts. It is simply because so many of those who place mines on the London market prefer to go to districts about which there is less information obtainable in order that the claims of their prospectors may not be too closely questioned.

Africa has been deserted by this class of promoters because the properties are too well known.

The State's Lands and Mining Claims.

Under the act of Congress of March 3, 1853, there was granted to the State of California the sixteenth and thirty-sixth sections in each township, which grant takes effect when these sections are identified by survey. There was no exception made in the act itself of the mineral lands, and it was held for many years by the State Supreme Court that the mineral lands passed to the State. However, later the United States Supreme Court overruled this interpretation of the law and upon the authority of its decision the State Supreme Court in 1891 reversed its former holding in the following language:

In Higgins v. Houghton, 25 Cal., 253, it was held by the Supreme Court of this State that mineral lands were not excepted from the operation of the grant of the sixteenth and thirty-sixth sections, made to the State by the act of March 3, 1853, and that as fast as the townships were surveyed the State became the owner of these sections absolutely. (And see Wedkind v. Craig, 56 Cal., 642.)

The rule declared by this court, as above stated, has not been approved by the Supreme Court of the United States. On the contrary, it was held by that court, in Mining Company v. Consolidated Mining Company, 102 U. S., 167, that the grant of the sixteenth and thirty-sixth sections of public land to the State of California, by the act of March 3, 1853, was not intended to cover mineral lands, but that such lands were, by the settled policy of the general government, excluded from all grants.

That decision is controlling, and must be followed here. The question then remains, Were the disputed premises, at the time of the grant, mineral lands—that is, known to be valuable for minerals? (Deffeback v. Hawke, 115 U. S., 404.)

Prior to this decision, the Legislature, assuming State ownership of the mineral school sections, provided for their sale by acts passed March 28, 1874, February 3, 1876, and April 6, 1880. Notwithstanding these later decisions, the State laws providing for the sale of mineral lands remain upon the statute books, and there is nothing to prevent the Surveyor-General from receiving an application and issuing a State title to lands which are not the property of the State.

The statutes are waste material and should be repealed. They may become the cause of confusion of titles. In fact, they have in the past.

Senator Stratton has introduced in the State Senate a bill providing for their repeal (Senate Bill No. 615), which was referred to the Committee on Mines, Drainage and Mining Debris, and has been by them favorably reported.

A Change of Policy.

Not so many years ago—1846—the reward meted out by the New South Wales, Australia, authorities to a convict who discovered gold was 100 lashes on the back. It was feared that if Australia became known as a gold-producing country it would be utterly spoiled as a receptacle for convicts. Now the paternal governments of the Colonies are doing more to encourage prospecting than any others in the world. Large sums in the way of bonus are offered by one for the discovery of new gold fields, government aid is offered in other cases for putting up mills and mining shafts on mines, it is proposed to erect a public crushing plant in New South Wales, and now comes the Minister for Mines of that colony suggesting that the Education department should establish classes in Sydney and other large towns for the instruction of prospectors, in order to enable them to determine on the spot the various minerals they may come across.

Concentrates.

THERE are employed in the mines about Baker City, Oregon, 1000 men.

IN the Colar gold fields of Mysore, India, the yield for 1896 was £1,251,738.

THE Comstock pay roll for January was $60,548 50—$1000 more than December.

THERE is a bill before the Utah Legislature to provide for a State Mine Inspector.

THE owners of the Thorpe mine, in Calaveras county, Cal., propose to put up a 10-stamp mill and a cyanide plant

DURING the twelve years of its existence the Broken Hill field has produced silver and lead to the value of £22,540,000.

THE Stockton company which owns the Arbona mine at Tuttletown, Tuolumne county, Cal., intends putting up a 10-stamp mill.

THE movement to incorporate the town of Rossland, British Columbia, promises to succeed, as the government of Canada promises support.

ACCORDING to the Denver *Republican* the output of Cripple Creek, Colorado for January was $1,350,000, against $700,000 for January, 1896.

MEN are looking over the ground on Rogue river, Southern Oregon, with a view to putting in a dredging plant to work the auriferous gravels.

A TELEGRAM from Guthrie, Oklahoma, announces that a detachment of troops had arrested a number of miners at work in the Wichita mountains.

R. A. F. PENROSE JR. of Colorado Springs, Colo., will soon begin the erection of a 40-stamp mill in Sulphur Spring Valley, Arizona, near Wilcox.

THE Nelson *Tribune* estimates the population of West Kootenay, including Nelson, Ainsworth, Slocan, Trail and Revelstoke districts, at about 16,000.

THE Mount Morgan mine of Australia, during the six months ending Nov. 30th last, produced 56,295 tons of ore, from which 75,506 ounces of gold were obtained.

F. AUGUST HEINZE is arranging for the extension of the Columbia & Western Railway, running into British Columbia, westward to the Okanogan country.

AT the last reports on the Robinson Deep in the Rand, South Africa, a shaft had reached a depth of 2137 feet. The distance sunk in the month of November was 73 feet.

SINCE D. H. Moffat and others have obtained control of the property they have announced their intention of again starting the Deep shaft on Aspen mountain, Colo.

AT the Royal Mint, Melbourne, for the week ending January 9th, 1897, the gold received was 80,329 ounces, and the value of gold coin and bullion issued was £121,669.

THE California Exploration Company have offered to bond the Good Hope mine, near the Gwin mine, in Calaveras county, Cal., from the owner, Harry Howarth, for $40,000.

NEAR Elizabethtown, New Mexico, there have been made discoveries of gold ore, and it is claimed that 75 pounds from the Black Copper mine assayed at the rate of $100,000 a ton.

IN the new copper properties near Goleonda, Nevada, the English people who have them under bond employ 45 men, and the developments made indicate that they will take the mine.

ON the W. Y. O. D. mine in Nevada county, Cal., a tunnel 475 feet long, 7 feet high, 4 feet wide on the bottom and 3 feet on top, was run between December 27th last and February 3rd.

MANY new strikes made in Cripple Creek during the past two months have enlivened the camp very much. The chief need is for greater milling capacity for the treatment of low-grade ores.

AMERICAN concessionaries who went into the Corean gold fields some months ago are well pleased with the outlook and are erecting a mill and making other arrangements to work on a large scale.

THE Mountain Copper Company, at Keswick, California, has bonded the Utah Consolidated, in Old Diggings district, Shasta county, which contains a large ledge that has resisted economical treatment by ordinary methods.

THE monthly statement of the Alaska-Mexican Gold Mining Company for December shows: Bullion shipment, $27,170; ore milled, 10,572 tons; sulphurets treated, 147 tons. Of bullion there came from sulphurets $6661; working expenses for period, $20,664.

THE Bodie, Cal., *Index* states that Cain & McCone are working ore at the Bodie tunnel mill at a cost of about $2 per ton, and that if they could do away with the fuel expense by the introduction of electric power the cost of milling would hardly exceed $1 per ton.

MOST of the big mines in the Slocan and Kaslo districts in British Columbia have contracted for their ore for some time, and the bulk of it will go to American smelters. The ore in the Ainsworth district is being sold on short contracts, and most of it comes over the line.

THE coast cities of British Columbia are agitating the question of building smelters and securing direct railway communication with the Kootenay country, in order to prevent all the trade from going to eastern Canada over the Canadian Pacific or to the United States.

A LONDON syndicate has been given an option to deposit $100,000 in bank at Spokane, Wash., for the purpose of purchasing the Le Roi mine in British Columbia for something over $4,000,000. In case they fail to accept, another English syndicate will be given an option.

SALT LAKE capitalists are figuring on putting up a smelter at Vancouver, British Columbia, in conjunction with people from Portland, Oregon. Proposed smelters have been located in many places in the Northwest, but the railroad builders will determine which shall be put up.

AT a meeting of the miners of Randsburg district, Kern county, California, last week they passed a set of strong resolutions condemning malicious claim-jumping, and announcing that it would no longer be tolerated. These claim-jumpers have been doing much harm by destroying confidence in titles.

THE British Columbia cinnabar mines are giving promise of turning out well. The British Columbia Cinnabar Company, which controls the largest property, has had a force of 25 men at work during the winter and is erecting furnaces. They have been developing the property for two years and have extracted 120 flasks of quicksilver.

THE Spokane papers are advocating the opening up of the south half of the Colville, Wash., Reservation. At present this acts as an impassable barrier to the Okanogan mines. It is claimed that its opening will mean not only opening up of 3,000,000 acres of land in the reservation, but practically of a larger country beyond, by allowing railroads to be built.

THE Helena and Frisco Company, a majority of whose stock was lately purchased by the Exploration Company, will soon be reorganized. The property is located in Idaho, the company is incorporated under the laws of Montana, and it is proposed now to form the new incorporation under the laws of West Virginia

EASTERN capitalists have been in Santa Fé county, New Mexico, lately, negotiating for the purchase of 60,000 acres of land known as the Ortiz mine grant, and owned by Senator Elkins of West Virginia, R. C. Kerens of St. Louis and others. The property contains gold mines, some of the workings being over 100 years old.

IN the San Carlos reservation, Arizona, since the segregation of part of the land, considerable prospecting has been done and several mining camps have been started. The ore is mostly copper carrying gold. In one district, where large bodies of galena ore have been discovered, there are evidences of work having been done many decades ago.

IT is proposed to establish in Auckland, New Zealand, a mining bank, but the plan has never been figured out in detail. During the boom times in Broken Hill, Australia, in the eighties, the branches of all the big banks loaned money on shares, but this has ceased. It is suggested that the proposed bank advance on "margins," as do the brokers.

AT Otago, New Zealand, the Roxburgh Amalgamated Company six years ago put in two hydraulic elevators to work auriferous gravels, and now have five in operation. The company have within the six years of their existence worked about twenty-five acres. In that time they have taken out 10,776 ounces of gold, equal in value to $200,000.

AN evidence of the value to any new mining district of railway competition is furnished in the Northwest. Upon the opening up of the mines of British Columbia, the American roads hastened to form connections, and these are afforded splendid facilities for shipping ore. Want of competition in Canada has given the business to the competing Americans.

IT has been demonstrated that the siliceous ore belt in the Black Hills, South Dakota, extends from Nigger hill, in the Bear gulch country, to Custer Peak, a distance of sixty-six miles from northwest to southeast, and from Crook mountain on the northeast to Spearfish creek on the southwest, a distance of thirty-five miles; and yet outside of this scope of country numerous prospectors are at work.

A DIVIDEND has been paid by a mine in the new Lake of the Woods district in Ontario, Canada. The local press gives the following account of it: "The Golden Gate Mining Company directors met this afternoon and declared a dividend of 50 per cent. This is the first company operating in the Lake of the Woods to declare a dividend. The money was made, not by working the mine, but by a sale to an Englishman named Laycock."

THE reports of the Union Pacific railroad as to shipments of ores in Utah show a heavy increase over last year. The most striking increase for the last week in January was in the amount of silver and lead ore, the record showing that during the week covered by the report 48 carloads were shipped, as compared with 23 cars in 1896. During the same period the same company handled 23 cars of silver and lead bullion, 2 carloads of copper bullion, 1 car of copper matte, and 9 cars of concentrates.

A TELEGRAM from Nelson, British Columbia, states that the exports of mineral from Kootenay for January, as declared at the Nelson custom house, were: Ore, 3402 tons, value $258,779; matte, 1141 tons, value $416,727; total value, $675,506. Eight hundred and fifty-two tons are reported as being shipped via Nakusp and Revelstoke, worth at least $85,200, bringing the total for the month up to $760,706, and making the exports for the two months, December and January, considerably over a million dollars.

AN association composed entirely of mining men has been formed at Nelson, British Columbia, for the purpose of supervising all legislation relating to mining matters especially, and considering other subjects of interest to the industry. Late last session of the Legislature a clause was hurriedly inserted into the mineral act, depriving miners of the right, which they had previously enjoyed, of cutting timber for mining purposes anywhere on Crown lands. Efforts will be made to put this matter on the original basis.

J. M. HARRIS, a man now about 30 years of age, went from the Cœur d'Alene country to the Slocan, in British Columbia, in 1892 and purchased a prospect, the Reco. February 1st the Reco Mining Company declared a dividend of $100,000. J. M. Harris, who was elected president and manager, stated: "Previous to incorporation the mine paid in dividends $37,500 and $150,000 in development, and shipped nearly $200,000 worth of ore. We claim $3,000,000 worth of ore in sight to-day."

NOW that there is such an increased demand for copper, prospecting for mines is going on more actively than ever. Many of the known deposits which have not of late been worked, owing to the price and low grade of the ore, are again being exploited. This is particularly true in Arizona. In the mountains about Tucson there are known to be many bodies of ore. A great advantage the prospector has nowadays over the man who went out a few years ago is the fact that he is better equipped for determining the value of what he finds.

AS to the late boom in West Australian mining stocks the Sydney *Daily Telegraph* says: "We can promise London folk that shortly there will be exposures which will edify them. They will learn, for example, that a mine of which the present market value on the London Stock Exchange is over £160,000 has had two big crushings in succession which have returned 3 dwt. and 4 dwt. per ton, and that the information has been withheld from the shareholders, who have been led to believe that the battery has been idle pending additions and alterations."

SOME of the gravel miners along the streams in Siskiyou county, Cal., are becoming interested in a scoop or dredging apparatus lately invented for working gulch and creek bed claims, where the bedrock is deep. It is simply a scoop guided by a slanting cable, extending 100 feet or more in length, to bottom of diggings, 30 to 50 feet deep in an open cut. This method, it is claimed, does away with the use of derrick or pump, as the scoop will take up gravel and water to the extent of over a ton each load, and can be worked rapidly with one man at the engine and two more in the cut, doing the work of a dozen or more men under the old system.

ACCORDING to the report of the Princess Estate and Gold Mining Company, Limited, of Johannesburg, South Africa, during the last year they treated by the cyanide process 83,662 tons, 75 per cent of the tonnage crushed. During the first four months the percentage of gold extraction was only 60.46 per cent of the gold contents of the ore, vegetable matter having had a deleterious influence on the cyanide solutions. In the last eight months, whenever clean sands were treated, the actual percentage of extraction rose to 71.8 per cent, and ultimately 75 per cent.

SHAFT SINKERS on the Amador Queen No. 1 at Jackson, Amador county, Cal., owned by the Jackson Exploration and Development Company, Limited, claim a record. The shaft is being sunk by contract, three eight-hour shifts of two men each being employed. Sam Harvey is the contractor and attends to the timbering, his partners being J. Kitto (who, in conjunction with Harvey, won the drilling contest championship in 1895), John Fox, Hart Roberts, Sam Harris, J. Staples and Joe Jefford. During the month of January, 1897, after being hampered by a sudden influx of water for two or three days, this crew of men sunk and timbered the shaft 85 feet. The shaft is 9x5 feet within timbers, 12x12 timbers being used, and is in granite.

IN the Aspen, Colorado, district the managers and owners of all the large properties have agreed to reduce the scale of royalties exacted from leasing miners in amount to correspond to reductions promised in freight by the railroad companies. The agreement as drafted states that the owners and leasers of mines in the vicinity of Aspen, realising that the mines contain large bodies of low-grade silver ores, which cannot be mined and marketed at a profit under existing railroad transportation and royalty rates, and knowing that a reduction in these rates would greatly increase the output of ore and furnish employment to a large number of men and thus add to the general prosperity of the city and county, agree to the reduction proposed.

A PARTY of miners, who had left Circle City, on the Yukon, Alaska, Nov. 18th, arrived at Dyea, on the southeast Alaskan coast, Jan. 28th. They report that a number of new strikes have been made on the Yukon. Of course, those who will gain the most are the men who have gone in prepared to make a long stay and carry themselves over a season or two. The newcomers of this summer need not expect that they can take advantage of the discoveries made without money. Yet, from all reports, in spite of the many difficulties of climate, transportation and shortness of supplies, men of experience, with provisions and money to carry them over for from two to three seasons, will find more than the usual opportunities for making a stake. But more unheeded advice has been given and will be given about Alaska than many less remote and more accessible districts. The usual rush of inexperienced tenderfeet, without means of subsistence, will go north in a few months.

THE following subjects for consideration have been suggested to the British Columbia Legislature by the *Mining Record* of Victoria, B. C.: Liberal appropriations for roads and trails; better police protection; amendments to the law relating to mining incorporations for the better protection of investors and the checking of over-capitalization of companies; a re-arrangement of mining recorders' offices, so as to give prospectors and others the least amount of trouble in recording claims; amendments to the act relating to the incorporation of towns; a liberal policy towards railway extension and to aid new railways; a strict scrutiny of all applications for railway charters; a liberal appropriation for advertising the mineral resources of the province and the publication of much needed maps of mining districts; abolishing working miners' licenses; an act to compel all mining companies doing business in this province, and incorporated under the laws of the State of Washington or elsewhere, to re-incorporate under the laws of British Columbia.

THE Slocan, British Columbia, district, with an area of about 15 by 25 miles, according to W. A. Carlyle, the government geologist, produced in 1896 18,215 tons of ore, which yielded 2,141,088 ounces of silver, and 19,210,666 pounds of lead or an average of 117.4 ounces of silver per ton and 52.7 per cent lead, giving a net profit of $75 per ton. Many carloads of ore shipped yielded as high as 300 and 400 ounces of silver per ton. The Slocan Star, which has the largest chute of high-grade ore in the district, received from the smelters from 11,529 tons of ore and concentrates sold during the last three years 912,000 ounces of silver and 13,482,000 pounds of lead. The mines shipping during the past season in the three districts were: Slocan, 42; Nelson, 4; Ainsworth, 9. The miners at work were: Slocan, 1000; Ainsworth, 200; Nelson, 350. The ore shipped was: Slocan, 2,816,561 ounces of silver, 17,778,884 pounds of lead, value $2,085,445, against $942,094 in 1895; Nelson, 586,143 ounces of silver and 2,010,294 pounds of lead, value $493,225, against $38,120 in 1895; Ainsworth, 203,897 ounces of silver and 2,476,972 pounds of lead, value $210,918, against $384,677 in 1895.

W. F. KENDRICK of Colorado directs attention to a new feature in the smelting interests of Denver and Pueblo—the shipping of ore, carrying heavy in lead as well as gold and silver, from the mines of British Columbia in bond through the United States to the Gulf of Mexico and thence by British steamers to Liverpool, the ore being smelted at Denver and Pueblo while in bond during transit. The ore carries upward of 60 per cent in lead, on which account the lead trust, it is claimed, tried to freeze out the English owners of the great silver and lead mines of British Columbia by declining to buy the output of the mines. That district is so far from the European market that the freight rates were heavily against them, so much so that the lead contained in their ore was of little commercial value. As the ore enters the United States boundary, it comes under charge of United States custom officials, and in this way is transported to the smelting works, where it is placed in bond warehouses, smelted, refined, the lead bullion shipped by rail to Galveston, thence by steamer to Liverpool, from 100 to 200 tons per day being handled in that way. It is claimed that the amount of lead that can be produced from these British Columbia mines would overstock the market and cause heavy loss to the trust, and the mine owners of that district, to protect themselves, formed a strong syndicate, which has been able to make arrangements with the railroad reaching the Gulf on terms enabling them to market their lead in Liverpool, distant from their mines by the route taken equal to over one-third the circumference of the globe.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office. No. 220 Market Street, Northeast Corner Front, San Francisco.
☞ Take the Elevator, No. 12 Front Street.

ANNUAL SUBSCRIPTION:
United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

Our latest forms go to press on Thursday evening.

San Francisco, February 13, 1897.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Four-Cycle Gas Engine, 129. The Jeffrey Coal Cutter; Jeffrey Mine Locomotives, 136.

EDITORIAL.—A Successful Inventor; A Mining Report on West Kootenay; Four-Cycle Gas Engine; Russian Engineers in California, 129. What an Authority on Advertising Says; The Mineral Land Bill; The Chinese and the Mines; The Debris Bills; The English Promoters; The State's Lands and Mining Claims; A Change in Policy, 130.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 134-5.

SCIENTIFIC PROGRESS.—Calcium Carbide: A New Reducing Agent; Tetanus Antitoxin: Penetrating Powers of Powerful Lights; Important Alloys; For the Progress of Science, 136.

ELECTRICAL PROGRESS.—Jeffrey Coal Mining Machinery; Incandescent Lamps; Ocean Telephony, 136. Electric Power in Gold Mining; A New Process of Separating Metals, 137.

MECHANICAL PROGRESS.—The River Dredger; Carbolic Acid for Tempering Steel; To Protect Miners' Lives; A Scheme to Insure the Safety of Trains, 137.

PRACTICAL INFORMATION.—Eastern Chinese Railway; Aluminum on Warships; Tea Drunkards; Incandescent Gas Lighting; May Be Outdone in Africa: British and Australian Sovereigns; Sharks in the Mediterranean; Origin of Petroleum; For Industrial Greatness; To Discover a True Weather Indicator, 137.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 146.

MISCELLANEOUS.—Concentrates, 131. Outline of the Geology of California with Reference to Its Mineral Deposits; California Deep Mining; Care of the Transit and Methods of Work, 132. The Coal Fields of Esmeralda County, Nev.; Deep Shafts, 133. Coast Industrial Notes; Personal; Commercial Paragraphs; Recent California Mining Incorporations; Recently Declared Mining Dividends, 139. Books Received, 147.

In its issue of the 3rd inst. the greatest authority on advertising in this country says: "Many advertisers never learn that that which will pay them best may not be that which they like best. The best advertisers are those who cast prejudices and preferences aside, and utilize those methods which most effectively influence the public."

The mineral land bill seems doomed to fail of passage by Congress at this session. But a few days remain and much business is before the House, and unless just pressure can be brought to bear upon the Speaker, and immediately, there is little hope of success. If it does fail, its passage at the next session will be of little value, for the lands in question are being so rapidly patented that there would be little work for the commission.

The Chinese and the Mines.

There has been considerable increase of late in the agitation against Chinese immigration in British Columbia. In Eastern Canada there is growing up more sympathy for the movement and petitions are being signed in Toronto, Montreal and Ottawa asking that a tax of $500 per capita be imposed on Chinese coming into the country. The greatest evil done by this nationality, from the standpoint of those interested in the mining industry, outside of the harm done to mining laborers, is through their taking up and working gravel mines and shipping the gold product out of the country. This they do, too, without making any large investments or doing development work that will be of lasting value or tend to improve the industry.

In California the Chinese have never been known to develop mines on a large scale or expend money that will be of value to the mining or other industries. Chinese miners' names are not on the books of the machinery and supply men of San Francisco. Yet, for the number of men of that race engaged in mining, probably they take out as much gold as do the whites.

Along the rivers and creeks of California, where there is auriferous gravel, particularly in Trinity, Siskiyou, Plumas and Placer, may be seen hundreds of Chinese working with small sluices, rockers or pans, upon ground that belongs yet to the Federal Government. They are squatters upon the public domain—aliens who, when they have gathered a few hundreds, will return to China.

Under the laws of the United States no one but a citizen, or one who has declared his intention to become one, may locate a mine. It has been suggested that the State Legislature pass an act providing some penalty for the working of mines that are not located. The enforcement of such a law would preserve these mines that, if not exhausted by the Chinese, would in time afford means of livelihood for part of our increasing population.

The Debris Bills.

An attempt is being made to show that there is asked from the California State Legislature for restraining dams and for dredgers nearly double what is really asked. There is now $250,000 in the State treasury appropriated by an act of March 24, 1893. To make this available the Legislature must amend the present law. Governor Budd pointed this out in his address to the last convention of the Miners' Association, and Controller Colgan, in a letter last Wednesday to Mr. Soward, author of the bill for the re-appropriation of the money, says that no part of this appropriation has been drawn from the State treasury, and the entire amount remains therein unexpended. He continues: "There appears to be no limitation as to the life of the appropriation. The only conditions surrounding it are that no warrant against it may be drawn or paid until the United States Government shall have appropriated an equal amount for a like purpose, and that the money is to be paid only upon orders drawn by the Controller upon the written request of the Debris Commissioner, and only for payment of not more than one-half of the cost of construction of works for restraining and impounding mining debris. It follows, therefore, that unless the law is amended or the office of Debris Commissioner is continued in existence, the appropriation could not be used, as no legal demand could be made upon the Controller."

And yet in the face of this it is claimed that $550,000 is being asked from the State.

There is being asked $300,000, and only that from this Legislature for caring for debris. As to this which is for dredging the Sacramento, it is urged that such work is the duty of the Federal Government. That is true, but the Federal Government refuses to act, and unless the State steps in, much more damage will soon be done than would be represented by the amount asked for.

However, California has had a good lesson from the appropriation of 1893 of the $250,000 for impounding dams. That was not so much proper work for the Federal Government as the dredging of the river, yet when the Legislature made the appropriation conditional upon a like appropriation from Congress, there was found little trouble in obtaining it.

If the State Legislature will now make the proposed appropriation of $300,000 for the dredging, there can be little question that Congress will do more in the future than it would if the bill fails to pass. In that way, from a financial point of view, it is safe to say that the State could make no better investment. An increased expenditure for the Sacramento river on the part of Congress will mean increased attention to the other needs of California in the way of caring for rivers and harbors.

The English Promoter.

Some time ago mention was made in these columns of a case of over-capitalization of a mine in Montana on the London market. For the stock £150,000 was asked, and of this £130,000 was to go to the vendors, promoters, etc., and £20,000 was for working capital on a mine without a mill or machinery and only £32,500 in ore in sight. Lately some Englishmen obtained an option on the War Eagle mine, in the Trail Creek district, British Columbia. The price was $1,000,000, or a little less. They failed to take the property, which has since been sold to a Canadian syndicate for about $800,000.

But the prospectus issued by the company formed in London—the War Eagle Mining Company—to take over the property called for £500,000, or nearly $2,500,000, for the vendors. This may be called a case of over-capitalization with a vengeance, or barefaced robbery. The War Eagle was well-developed, and the owners were not forced to sell nor desirous of selling unless they got a fair price. It is safe enough to presume that the mine was not worth more than they asked. Yet these London promoters calmly added 150 per cent to the price and made up a prospectus to fit a mine worth two and a half millions.

Had the London public been taken in, they would never have thought of blaming their own people, the promoters, but would have called down maledictions on the rascally Canadians.

Most of the trouble about the Australian mines has been caused by the greed of promoters in London, and yet Australians are the ones to suffer in the end from want of confidence on the part of capital in their properties. It is often asked why English capital is not more anxious to seek investment in California mines or properties in other old mining districts. It is simply because so many of those who place mines on the London market prefer to go to districts about which there is less information obtainable in order that the claims of their prospectors may not be too closely questioned.

Africa has been deserted by this class of promoters because the properties are too well known.

The State's Lands and Mining Claims.

Under the act of Congress of March 3, 1853, there was granted to the State of California the sixteenth and thirty-sixth sections in each township, which grant takes effect when these sections are identified by survey. There was no exception made in the act itself of the mineral lands, and it was held for many years by the State Supreme Court that the mineral lands passed to the State. However, later the United States Supreme Court overruled this interpretation of the law and upon the authority of its decision the State Supreme Court in 1891 reversed its former holding in the following language:

In Higgins v. Houghton, 25 Cal., 253, it was held by the Supreme Court of this State that mineral lands were not excepted from the operation of the grant of the sixteenth and thirty-sixth sections, made to the State by the act of March 3, 1853, and that as fast as the townships were surveyed the State became the owner of these sections absolutely. (And see Wedkind v. Craig, 56 Cal., 642.)

The rule declared by this court, as above stated, has not been approved by the Supreme Court of the United States. On the contrary, it was held by that court, in Mining Company v. Consolidated Mining Company, 102 U. S., 167, that the grant of the sixteenth and thirty-sixth sections of public land to the State of California, by the act of March 3, 1853, was not intended to cover mineral lands, but that such lands were, by the settled policy of the general government, excluded from all grants.

That decision is controlling, and must be followed here. The question then remains, Were the disputed premises, at the time of the grant, mineral lands—that is, known to be valuable for minerals? (Deffeback v. Hawke, 115 U. S., 404.)

Prior to this decision, the Legislature, assuming State ownership of the mineral school sections, provided for their sale by acts passed March 28, 1874, February 3, 1876, and April 6, 1880. Notwithstanding these later decisions, the State laws providing for the sale of mineral lands remain upon the statute books, and there is nothing to prevent the Surveyor-General from receiving an application and issuing a State title to lands which are not the property of the State.

The statutes are waste material and should be repealed. They may become the cause of confusion of titles. In fact, they have in the past.

Senator Stratton has introduced in the State Senate a bill providing for their repeal (Senate Bill No. 615), which was referred to the Committee on Mines, Drainage and Mining Debris, and has been by them favorably reported.

A Change of Policy.

Not so many years ago—1846—the reward meted out by the New South Wales, Australia, authorities to a convict who discovered gold was 100 lashes on the back. It was feared that if Australia became known as a gold-producing country it would be utterly spoiled as a receptacle for convicts. Now the paternal governments of the Colonies are doing more to encourage prospecting than any others in the world. Large sums in the way of bonus are offered by one for the discovery of new gold fields, government aid is offered in other cases for putting up mills and mining shafts on mines, it is proposed to erect a public crushing plant in New South Wales, and now comes the Minister for Mines of that colony suggesting that the Education department should establish classes in Sydney and other large towns for the instruction of prospectors, in order to enable them to determine on the spot the various minerals they may come across.

Concentrates.

THERE are employed in the mines about Baker City, Oregon, 1000 men.

IN the Colar gold fields of Mysore, India, the yield for 1896 was £1,251,738.

THE Comstock pay roll for January was $60,548 50—$1000 more than December.

THERE is a bill before the Utah Legislature to provide for a State Mine Inspector.

THE owners of the Thorpe mine, in Calaveras county, Cal., propose to put up a 10-stamp mill and a cyanide plant.

DURING the twelve years of its existence the Broken Hill field has produced silver and lead to the value of £22,540,000.

THE Stockton company which owns the Arbona mine at Tuttletown, Tuolumne county, Cal., intends putting up a 10-stamp mill.

THE movement to incorporate the town of Rossland, British Columbia, promises to succeed, as the government of Canada promises support.

ACCORDING to the Denver *Republican* the output of Cripple Creek, Colorado for January was $1,350,000, against $700,000 for January, 1896.

MEN are looking over the ground on Rogue river, Southern Oregon, with a view to putting in a dredging plant to work the auriferous gravels.

A TELEGRAM from Guthrie, Oklahoma, announces that a detachment of troops had arrested a number of miners at work in the Wichita mountains.

R. A. F. PENROSE JR. of Colorado Springs, Colo., will soon begin the erection of a 40-stamp mill in Sulphur Spring Valley, Arizona, near Wilcox.

THE Nelson *Tribune* estimates the population of West Kootenay, including Nelson, Ainsworth, Slocan, Trail and Revelstoke districts, at about 16,000.

THE Mount Morgan mine of Australia, during the six months ending Nov. 30th last, produced 56,298 tons of ore, from which 75,506 ounces of gold were obtained.

F. AUGUST HEINZE is arranging for the extension of the Columbia & Western Railway, running into British Columbia, westward to the Okanogan country.

AT the last reports on the Robinson Deep in the Rand, South Africa, a shaft had reached a depth of 2137 feet. The distance sunk in the month of November was 73 feet.

SINCE D. H. Moffat and others have obtained control of the property they have announced their intention of again starting the Deep shaft on Aspen mountain, Colo.

AT the Royal Mint, Melbourne, for the week ending January 9th, 1897, the gold received was 80,829 ounces, and the value of gold coin and bullion issued was £121,669.

THE California Exploration Company have offered to bond the Good Hope mine, near the Gwin mine, in Calaveras county, Cal., from the owner, Harry Howarth, for $40,000.

NEAR Elizabethtown, New Mexico, there have been made discoveries of gold ore, and it is claimed that 75 pounds from the Black Copper mine assayed at the rate of $100,000 a ton.

IN the new copper properties near Golconda, Nevada, the English people who have them under bond employ 45 men, and the developments made indicate that they will take the mine.

ON the W. Y. O. D. mine in Nevada county, Cal., a tunnel 475 feet long, 7 feet high, 4 feet wide on the bottom and 3 feet on top, was run between December 27th last and February 3rd.

MANY new strikes made in Cripple Creek during the past two months have enlivened the camp very much. The chief need is for greater milling capacity for the treatment of low-grade ores.

AMERICAN concessionaries who went into the Corean gold fields some months ago are well pleased with the outlook and are erecting a mill and making other arrangements to work on a large scale.

THE Mountain Copper Company, at Keswick, California, has bonded the Utah Consolidated, in Old Diggings district, Shasta county, which contains a large ledge that has resisted economical treatment by ordinary methods.

THE monthly statement of the Alaska-Mexican Gold Mining Company for December shows: Bullion shipment, $27,170; ore milled, 10,572 tons; sulphurets treated, 147 tons. Of bullion there came from sulphurets $6661; working expenses for period, $20,664.

THE Bodie, Cal., *Index* states that Cain & McCone are working ore at the Bodie tunnel mill at a cost of about $2 per ton, and that if they could do away with the fuel expense by the introduction of electric power the cost of milling would hardly exceed $1 per ton.

MOST of the big mines in the Slocan and Kaslo districts in British Columbia have contracted for their ore for some time, and the bulk of it will go to American smelters. The ore in the Ainsworth district is being sold on short contracts, and most of it comes over the line.

THE coast cities of British Columbia are agitating the question of building smelters and securing direct railway communication with the Kootenay country, in order to prevent all the trade from going to eastern Canada over the Canadian Pacific or to the United States.

A LONDON syndicate has been given an option to deposit $100,000 in bank at Spokane, Wash., for the purpose of purchasing the Le Roi mine in British Columbia for something over $4,000,000. In case they fail to accept, another English syndicate will be given an option.

SALT LAKE capitalists are figuring on putting up a smelter at Vancouver, British Columbia, in conjunction with people from Portland, Oregon. Proposed smelters have been located in many places in the Northwest, but the railroad builders will determine which shall be put up.

AT a meeting of the miners of Randsburg district, Kern county, California, last week they passed a set of strong resolutions condemning malicious claim-jumping, and announcing that it would no longer be tolerated. These claim-jumpers have been doing much harm by destroying confidence in titles.

THE British Columbia cinnabar mines are giving promise of turning out well. The British Columbia Cinnabar Company, which controls the largest property, has had a force of 25 men at work during the winter and is erecting furnaces. They have been developing the property for two years and have extracted 120 flasks of quicksilver.

THE Spokane papers are advocating the opening up of the south half of the Colville, Wash., Reservation. At present this acts as an impassable barrier to the Okanogan mines. It is claimed that its opening will mean not only opening up of 3,000,000 acres of land in the reservation, but practically of a larger country beyond, by allowing railroads to be built.

THE Helena and Frisco Company, a majority of whose stock was lately purchased by the Exploration Company, will soon be reorganized. The property is located in Idaho, the company is incorporated under the laws of Montana, and it is proposed now to form the new incorporation under the laws of West Virginia.

EASTERN capitalists have been in Santa Fe county, New Mexico, lately, negotiating for the purchase of 60,000 acres of land known as the Ortiz mine grant, and owned by Senator Elkins of West Virginia, R. C. Kerens of St. Louis and others. The property contains gold mines, some of the workings being over 100 years old.

IN the San Carlos reservation, Arizona, since the segregation of part of the land, considerable prospecting has been done and several mining camps have been started. The ore is mostly copper carrying gold. In one district, where large bodies of galena ore have been discovered, there are evidences of work having been done many decades ago.

IT is proposed to establish in Auckland, New Zealand, a mining bank, but the plan has never been figured out in detail. During the boom times in Broken Hill, Australia, in the eighties, the branches of all the big banks loaned money on shares, but this has ceased. It is suggested that the proposed bank advance on "margins," as do the brokers.

AT Otago, New Zealand, the Roxburgh Amalgamated Company six years ago put in two hydraulic elevators to work auriferous gravels, and now have five in operation. The company have within the six years of their existence worked about twenty-five acres. In that time they have taken out 10,776 ounces of gold, equal in value to $200,000.

AN evidence of the value to any new mining district of railway competition is furnished in the Northwest. Upon the opening up of the mines of British Columbia, the American roads hastened to form connections, and these are afforded splendid facilities for shipping ore. Want of competition in Canada has given the business to the competing Americans.

IT has been demonstrated that the siliceous ore belt in the Black Hills, South Dakota, extends from Nigger hill, in the Bear gulch country, to Custer Peak, a distance of sixty-six miles from northwest to southeast, and from Crook mountain on the northeast to Spearfish creek on the southwest, a distance of thirty-five miles; and yet outside of this scope of country numerous prospectors are at work.

A DIVIDEND has been paid by a mine in the new Lake of the Woods district in Ontario, Canada. The local press gives the following account of it: "The Golden Gate Mining Company directors met this afternoon and declared a dividend of 50 per cent. This is the first company operating in the Lake of the Woods to declare a dividend. The money was made, not by working the mine, but by a sale to an Englishman named Laycock."

THE reports of the Union Pacific railroad as to shipments of ores in Utah show a heavy increase over last year. The most striking increase for the last week in January was in the amount of silver and lead ore, the record showing that during the week covered by the report 48 carloads were shipped, as compared with 23 cars in 1896. During the same period the same company handled 23 cars of silver and lead bullion, 2 carloads of copper bullion, 1 car of copper matte, and 9 cars of concentrates.

A TELEGRAM from Nelson, British Columbia, states that the exports of mineral from Kootenay for January, as declared at the Nelson custom house, were: Ore, 3402 tons, value $258,779; matte, 1141 tons, value $416,727; total value, $675,506. Eight hundred and fifty-two tons are reported as being shipped via Nakusp and Revelstoke, worth at least $85,200, bringing the total for the month up to $760,706, and making the exports for the two months, December and January, considerably over a million dollars.

AN association composed entirely of mining men has been formed at Nelson, British Columbia, for the purpose of supervising all legislation relating to mining matters especially, and considering other subjects of interest to the industry. Late last session of the Legislature a clause was hurriedly inserted into the mineral act, depriving miners of the right, which they had previously enjoyed, of cutting timber for mining purposes anywhere on Crown lands. Efforts will be made to put this matter on the original basis.

J. M. HARRIS, a man now about 30 years of age, went from the Cœur d'Alene country to the Slocan, in British Columbia, in 1892 and purchased a prospect, the Reco. February 1st the Reco Mining Company declared a dividend of $100,000. J. M. Harris, who was elected president and manager, stated: "Previous to incorporation the mine paid in dividends $37,500 and $150,000 in development, and shipped nearly $200,000 worth of ore. We claim $3,000,000 worth of ore in sight to-day."

Now that there is such an increased demand for copper, prospecting for mines is going on more actively than ever. Many of the known deposits which have not of late been worked, owing to the price and low grade of the ore, are again being exploited. This is particularly true in Arizona. In the mountains about Tucson there are known to be many bodies of ore. A great advantage the prospector has nowadays over the man who went out a few years ago is the fact that he is better equipped for determining the value of what he finds.

AS TO the late boom in West Australian mining stocks the Sydney *Daily Telegraph* says: "We can promise London folk that shortly there will be exposures which will edify them. They will learn, for example, that a mine of which the present market value on the London Stock Exchange is over £160,000 has had two big crushings in succession which have returned 3 dwt. and 4 dwt. per ton, and that the information has been withheld from the shareholders, who have been led to believe that the battery has been idle pending additions and alterations."

SOME of the gravel miners along the streams in Siskiyou county, Cal., are becoming interested in a scoop or dredging apparatus lately invented for working gulch and creek bed claims, where the bedrock is deep. It is simply a scoop guided by a slanting cable, extending 100 feet or more in length, to bottom of diggings, 30 to 50 feet deep in an open cut. This method, it is claimed, does away with the use of derrick or pump, as the scoop will take up gravel and water to the extent of over a ton each load, and can be worked rapidly with one man at the engine and two more in the cut, doing the work of a dozen or more men under the old system.

ACCORDING to the report of the Princess Estate and Gold Mining Company, Limited, of Johannesburg, South Africa, during the last year they treated by the cyanide process 38,682 tons, 75 per cent of the tonnage crushed. During the first four months the percentage of gold extraction was only 60.46 per cent of the gold contents of the ore, vegetable matter having had a deleterious influence on the cyanide solutions. In the last eight months, when only clean sands were treated, the actual percentage of extraction rose to 71.8 per cent, and ultimately 75 per cent.

SHAFT SINKERS on the Amador Queen No. 1 at Jackson, Amador county, Cal., owned by the Jackson Exploration and Development Company, Limited, claim a record. The shaft is being sunk by contract, three eight-hour shifts of two men each being employed. Sam Harvey is the contractor and attends to the timbering, his partners being J. Kitto (who, in conjunction with Harvey, won the drilling contest championship in 1895), John Fox, Hart Roberts, Sam Harris, J. Staples and Joe Jefford. During the month of January, 1897, after being hampered by a sudden influx of water for two or three days, this crew of men sunk and timbered the shaft 85 feet. The shaft is 9x5 feet within timbers, 12x12 timbers being used, and is in granite.

IN the Aspen, Colorado, district the managers and owners of all the large properties have agreed to reduce the scale of royalties exacted from leasing miners in amount to correspond to reductions promised in freight by the railroad companies. The agreement as drafted states that the owners and leasers of mines in the vicinity of Aspen, realizing that the mines contain large bodies of low-grade silver ores, which cannot be mined and marketed at a profit under existing railroad transportation and royalty rates, and knowing that a reduction in these rates would greatly increase the output of ore and furnish employment to a large number of men and thus add to the general prosperity of the city and county, agree to the reduction proposed.

A PARTY of miners, who had left Circle City, on the Yukon, Alaska, Nov. 18th, arrived at Dyea, on the southeast Alaskan coast, Jan. 28th. They report that a number of new strikes have been made on the Yukon. Of course, those who will gain the most are the men who have gone in prepared to make a long stay and carry themselves over a season or two. The newcomers of this summer need not expect that they can take advantage of the discoveries made without money. Yet, from all reports, in spite of the many difficulties of climate, transportation and shortness of supplies, men of experience, with provisions and money to carry them over for from two to three seasons, will find more than the usual opportunities for making a stake. But more unheeded advice has been given and will be given about Alaska than many less remote and more accessible districts. The usual rush of inexperienced tenderfeet, without means of subsistence, will go north in a few months.

THE following subjects for consideration have been suggested to the British Columbia Legislature by the *Mining Record* of Victoria, B. C.: Liberal appropriations for roads and trails; better police protection; amendments to the law relating to mining incorporations for the better protection of investors and the checking of over-capitalization of companies; a re-arrangement of mining recorders' offices, so as to give prospectors and others the least amount of trouble in recording claims; amendments to the act relating to the incorporation of towns; a liberal policy towards railway extension and to aid new railways; a strict scrutiny of all applications for railway charters; a liberal appropriation for advertising the mineral resources of the province and the publication of much needed maps of mining districts; abolishing working miners' licenses; an act to compel all mining companies doing business in this province, and incorporated under the laws of the State of Washington or elsewhere, to re-incorporate under the laws of British Columbia.

THE Slocan, British Columbia, district, with an area of about 15 by 25 miles, according to W. A. Carlyle, the government geologist, produced in 1896 18,215 tons of ore, which yielded 2,141,088 ounces of silver, and 19,210,666 pounds of lead or an average of 117.4 ounces of silver per ton and 52.7 per cent lead, giving a net profit of $75 per ton. Many carloads of ore shipped yielded as high as 300 and 400 ounces of silver per ton. The Slocan Star, which has the largest chute of high-grade ore in the district, received from the smelters from 11,529 tons of ore and concentrates sold during the last three years 912,000 ounces of silver and 13,482,000 pounds of lead. The mines shipping during the past season in the three districts were: Slocan, 42; Nelson, 4; Ainsworth, 9. The miners at work were: Slocan, 1000; Ainsworth, 200; Nelson, 350. The ore shipped was: Slocan, 2,316,561 ounces of silver, 17,778,384 pounds of lead, value $2,085,445, against $942,094 in 1895; Nelson, 586,143 ounces of silver and 2,010,294 pounds of lead, value $493,225, against $38,120 in 1895; Ainsworth, 203,897 ounces of silver and 2,476,972 pounds of lead, value $210,918, against $384,677 in 1895.

W. F. KENDRICK of Colorado directs attention to a new feature in the smelting interests of Denver and Pueblo—the shipping of ore, carrying heavy in lead as well as gold and silver, from the mines of British Columbia in bond through the United States to the Gulf of Mexico and thence by British steamers to Liverpool, the ore being smelted at Denver and Pueblo while in bond during transit. The ore carries upward of 60 per cent in lead, on which account the lead trust, it is claimed, tried to freeze out the English owners of the great silver and lead mines of British Columbia by declining to buy the output of the mines. That district is so far from the European market that the freight rates were heavily against them, so much so that the lead contained in their ore was of little commercial value. As the ore enters the United States boundary, it comes under charge of United States custom officials, and in this way is transported to the smelting works, where it is placed in bond warehouses, smelted, refined, the lead bullion shipped by rail to Galveston, thence by steamer to Liverpool, from 100 to 200 tons per day being handled in that way. It is claimed that the amount of lead that can be produced from these British Columbia mines would overstock the market and cause heavy loss to the trust, and the mine owners of that district, to protect themselves, formed a strong syndicate, which has been able to make arrangements with the railroad reaching the Gulf on terms enabling them to market their lead in Liverpool, distant from their mines by the route taken equal to over one-third the circumference of the globe.

Outline of the Geology of California, with Reference to Its Mineral Deposits.

Written for the MINING AND SCIENTIFIC PRESS by HAROLD W. FAIRBANKS, Ph. D

The great mining interests of California make it important that a general knowledge of the principles of geology should be possessed by those interested in the development of the various branches of this industry. The application of the science to the needs of society is its utilitarian aspect, but there is another important one. Men are inquisitive and want to know, for the satisfaction of knowing and being intelligent, about the wonderful processes of nature by which they are always surrounded.

As a civilized people we should develop science not only for its practical results, but also for its ministration to the higher purely intellectual life of the race. The nature studies, among which geology is one of the most important, although often more neglected, are of the highest value in leading men away from the more sordid motives of existence to a nobler conception of life. The cosmic principles illustrated in geologic changes are at work around us continually and if we go through life with our eyes shut to them we miss not only many pleasurable experiences but are certainly less able to cope with nature and turn her to our advantage. We are fortunate in living in a region filled with the most attractive examples of geological and mineralogical processes, and in what is to follow I shall try to present these in a manner to arouse interest in the scientific as well as practical side.

In this series of articles I shall endeavor to give an outline of the remarkably interesting geology of California, as well as some of the general principles by which geologists are guided in their efforts to unravel the almost inconceivable complex history of our earth. If I can arouse any to take an interest in this most practical of all studies, as well as impart some information which shall be of value to the miners, the objects for which these articles have been prepared will have been accomplished.

The science of geology has reached a position at the present day which entitles it to the consideration of legislators in their efforts to encourage and build up means for developing the natural wealth of the State. The science is not a mere ornamental set of theories, but a body of knowledge built up at the cost of much time and labor, which may be made of the highest practical value.

We look out upon the mountains, valleys, and rivers flowing to the great Pacific ocean and it seems to us, judging from our brief experience, that we are in a world whose features are permanent and stable. The expression of the poet Bryant, "The hills rock-ribbed and ancient as the sun," seems to us not poetry but reality. However, when we come to study closely the processes of nature we begin to doubt the truth of this idea, "the everlasting hills," for we sometimes find shells on their summits similar to those living in the ocean, and the conclusion seems irresistible that they were once beneath the sea and that the sea must now cover in places what was formerly dry land. To the beginner who has not yet learned the methods of research into the past history of the earth, the forms of nature about him are utterly puzzling and meaningless. It has been the effort of the geologist to discover the sequence of events which have taken place, and the method of their action in shaping the world and bringing it to its present condition. He has attempted to discover the laws exemplified in all the processes and to reduce the complex phenomena about us to order. But what has he to go by? Man was not upon the earth during the millions of years which have passed in its history, and how is he able to speak with any certainty about these distant happenings?

The underlying principles are partly as follows: So far as human experience is concerned nature is observed to be uniform and the sequence of events invariable. Nothing happens haphazard or according to chance. We reach the uniformitarian view of the world, which means that the same causes have operated during its whole history which we see operating to-day. The same conditions have always produced the same results. Our lives are so short that we cannot possibly experience the mighty changes which we know have taken place, but by careful observation we have been enabled to find out that our earth is not stable; that the sea and land are oscillating now as we know they have in the past; that mountain ranges are being worn away by erosion as well as undergoing uplift or depression. In short, by means of a critical observation of what is going on to-day we are able to decipher the ancient records of the world engraved in the rocky strata. In studying the geological processes going on now we find various phenomena taking place before our eyes which have been fossilized, so to speak, in the rocks on which we tread. At many places along the seashore we see great beds of pebbles and boulders being sorted and arranged in layers by the action of the waves. In climbing over the mountains many miles from the ocean we come upon beds of pebbles called conglomerates, which have the same appearance as those along the seashore, and the conclusion is formed that the mountains were once beneath the sea, and that where the conglomerates occur there was an ancient shore-line.

Beds of sand are formed at the present day in more quiet waters out farther from the shore, or on it when boulders are absent. When we meet among the rocks similar sands hardened to sandstone or quartzite by ages of consolidation and metamorphism, we argue that in those spots in ancient times conditions existed like those where sands are sorted in beds at the present day.

Farther at sea, or in quiet, partially inclosed bays, fine silt brought down from the mountains or ground from the sea-cliffs is being deposited, and in the course of ages it will be hardened to form shale or slate, or metamorphosed to form mica schist.

By means of the animal remains which have been entombed in these beds we are enabled to say whether the ancient body of water was the open ocean, partly inclosed brackish lagoon, or fresh water lake.

The great beds of limestone and marble scattered over the earth are also very interesting. They often consist, in part at least, of corals and other animal remains. A large part of the material of some beds may have been precipitated chemically in the bed of the ocean, but we are satisfied that those full of corals were formed in a manner similar to the coral reefs in the shallower regions of the tropics.

We also know that when tropical plants and animals are discovered in the arctic regions, that climates have not remained the same indefinitely in any particular locality, but that portions of the world have been at one time much warmer than now, while during another, called the glacial epoch, arctic animals and plants descended into what are now the temperate regions.

Our studies make it certain that, by means of the different characters exhibited by the rocky strata exposed in all parts of the world, whether sandstone, shale or limestone, or their metamorphosed products quartzite, mica schist or marble, we can determine the conditions existing in any special region and the disturbances which that region has undergone.

But these are not the only rocks with which we come in contact. There are the granitic types of many kinds, the greenstones, the porphyries, and various volcanic rocks. These all give evidences of once having been molten. There is good reason for believing that the globe has cooled from a molten condition to the comparatively stable one in which it is now. It used to be thought that in granite we had the original fire-formed crust of the globe, but now it is known that such is not the case, for we have found that in California the granite of the Sierra Nevadas has been squeezed into the auriferous slates which are quite young, geologically speaking. The original crust of the earth has in all probability entirely disappeared, and there have been formed in its place the later eruptive rocks and the sedimentary ones resulting from their decomposition.

(*To be Continued.*)

California Deep Mining.

It is no longer a debatable question whether deep mining on the "Mother Lode" in this State will justify the expenditure, for work done for several companies has demonstrated that it will pay. The old Eureka, at Sutter creek, Amador county, was worked to the 2200 level on the incline, and paid its owners several million dollars in dividends. This mine has been shut down for many years. There can be no doubt it will be opened up again and produce many millions more before the 3000 level is reached. The Kennedy mine, at Jackson, Amador county, is down 2200 feet vertical. At that point the largest ore body ever discovered in that mine has been developed. At the present writing the extent in length or depth of this great ore body is not known, but it is known to be from 30 to 40 feet wide of high grade milling ore. No doubt ought to exist in the minds of practical mining men in California about this ore body going down to the 3000 foot level. At 3000 feet it may be larger and even richer than it is on the 2200 level. The Oneida Mining Company, Amador county, are sinking a vertical three-compartment shaft, and intend to go to 1700 feet before they cut the vein. The Argonaut Mining Company, of Amador county, sunk their shaft 1400 feet before cross-cutting the vein. The old Keystone mine, at Amador City, paid several million dollars in dividends, was supposed to have been worked as deep as it would pay, and therefore was practically abandoned many years ago. The main shaft was only 1300 feet deep on the incline, and at that time the mine was shut down. About seven years ago the owners commenced to sink to the 1500 level. They started ten of their forty stamps, and shortly after ten more were dropping, and finally all the stamps were dropping on paying ore. Two years ago the old mill was burned down. A new forty-stamp mill was built and in running order in ninety days. It would not be surprising to see 100 stamps dropping on Keystone ore within the next year. The fissure in the Keystone is from 500 to 1000 feet in width. The Gwin mine, in Calaveras county, which paid several million dollars in dividends, was idle for eighteen years. The present owners had the money and the confidence in deep mining on the Mother Lode to spend their money freely. They started a new vertical shaft to cut the vein 1400 feet deep. At that depth the old bullion producer did not disappoint its new owners, for a fine body of high grade ore, 14 to 20 feet wide was developed. A fine forty-stamp mill was built, and inside of two years from the day papers were signed the owners commenced to get returns.—E. C. Loftus in Herald of Trade and Finance.

Care of the Transit and Methods of Work.

Written for the MINING AND SCIENTIFIC PRESS by O. H. PACKER, M. E.

It will be impossible to treat this subject exhaustively in so limited a space. Only the principal points can be mentioned.

Care of the Transit.—When not in use the instrument should be placed in its box or in a large case made to contain it mounted. Whether in the box or case the needle should be allowed to seek the pole and then be raised off the pin to prevent dulling the point. This will also assist the needle in retaining its magnetism. When the instrument is in the field, but not in actual use, it should be covered with a silk or waterproof sack to shield it from the rays of the sun, thus preventing unequal expansion of the standards, etc.

Clearing the glass above the needle from dust by rubbing with the silk cover often magnetizes the glass, causing the needle to "stick." To discharge the glass touch it in several places with the moistened finger. Use special care not to disturb any adjusting screws by an accidental blow. It is easier to keep an instrument in adjustment than to adjust it. If the objective slide is not protected by a dust guard remove the dust before closing the slide. Looseness in this slide affects the line of collimation and makes the instrument useless for accurate work.

Adjustment of the Transit.—This subject would require too much space to be discussed here.

To Run a Straight Line.—Having the two points which determine the line to be run, set the transit over the forward point with one pair of levelling screws *parallel* with the line. Level carefully with one plate level *across* the line and the telescope approximately on the rear point. With the tangent screw bisect the rear point. Revolve the telescope on its horizontal axis and locate a point in advance (using a stake, tack and plumb line). Reverse the telescope and backsight to test the stability of the instrument. If O. K. unclamp the alidade and revolve it approximately 180°. Revolve the telescope. It will be approximately on the rear point. Relevel the *cross* bubble. With the upper tangent screw bisect the rear point. Revolve the telescope and locate a second point in advance beside the first one (possibly on the same stake). Backsight again for stability. The true line passes half way between these two points. By this method all instrumental errors are eliminated. Of course this method cannot be used unless the transit has a full vertical circle, as it should have.

To Measure a Horizontal Angle.—Center the transit over the vertex of the angle to be measured. Bring the telescope approximately on one of the points. Level carefully. Bisect the point by means of the tangent screw. If the instrument has two verniers record the reading of each. Unclamp the alidade and turn the telescope upon the second point. Clamp. Bisect by means of the *upper* tangent screw. Record both vernier readings. Correct the readings of vernier A by one-half the difference between the readings of A and B. The difference between the corrected readings should be recorded as "corrected reading No. 1." Now approximately bisect the angle with the telescope. Revolve the telescope on its horizontal axis. Unclamp the alidade and revolve it approximately 180°. Relevel. Now measure the angle again and correct the readings as before. Record as "corrected reading No. 2." Correct No. 1 by one-half the difference between No. 1 and No. 2. The result is the *true* angle. This method eliminates all errors of adjustment and eccentricity.

To Measure a Vertical Angle.—See that the vertical circle reads 0° when the instrument is leveled, the plate and telescope levels agreeing. Bisect the point. The reading of the vertical circle is the true angle if the instrument is perfectly made and adjusted. But these perfect conditions never exist. Therefore, proceed as follows: Level. Measure the angle and record the reading. Revolve the alidade 180°. Revolve the telescope. Level *again* and measure the angle again. Take the average of the two readings for the true angle. This method eliminates the errors of adjustment in the plate bubbles and of the vernier to the vertical circle. It is evident that this method requires a full vertical circle.

Traversing.—Traverse surveying is running a series of consecutive straight lines, the azimuths or bearings being determined with reference to due south, *i. e.*, the bearing of each line is the angle formed by the intersection of each respective line with the meridian.

The limb should be graduated from 0° to 360° in the direction moved by the hands of a watch. In

order to make a traverse survey the instrument must be "oriented" at each station, *i. e.*, so placed that the telescope would point due south when vernier A reads 0°.

There are two ways of orienting. A customary method, not the best, is to clamp the alidade and revolve telescope before moving from a station. Then set up on the next station, bisecting the rear point by means of the *lower* tangent screw. Reverse the telescope. The instrument is now oriented. Bisect the next forward point. Record the readings and proceed as before.

A better method is to set vernier A to read the back azimuth at each station. The back azimuth is obtained by adding (subtracting) 180° to (from) the last forward reading. The length of the lines run can be measured by any accurate method.

Therefore, to run a traverse proceed as follows: Set up over station No. 1 with the telescope due south, vernier A reading 0°. With the lower limb clamped turn the alidade so as to bring the telescope on station No. 2. Bisect the point by means of the *upper* tangent screw. Record the vernier readings. Turn the alidade *exactly* 180°. Clamp. Set up on station No. 2. Unclamp the *lower* limb and bring the telescope on station No. 1. Clamp and bisect the point by means of the *lower* tangent screw. Now loosen the alidade, locate and bisect station No. 3. Record the vernier readings. Turn the alidade *exactly* 180° and proceed as before. The azimuths are recorded from 0° to 360°. The *latitudes* and *departures* are computed by means of the following formulæ:

$$\text{Departure} = \sin \times \text{distance}.$$
$$\square\text{Latitude} = \text{cosine} \times \text{distance}.$$

The use of logarithms will *greatly* lessen the work. For facilitating the office work there are special tables of sines and cosines conveniently arranged for azimuths from 0° to 360° and for every degree or 30 seconds of arc.

Junction, Nevada, Feb. 3, '97.

The Coal Fields of Esmeralda County, Nev.

Written for the MINING AND SCIENTIFIC PRESS by M. A. KNAPP.

About twenty-five miles from the great silver mines of Candelaria, Nevada, and the same distance from the Carson & Colorado Railroad at Rhodes' Marsh, lies an extensive but undeveloped coal field, first discovered about three years ago. Had it been found before the Candelaria silver mills shut down, and while they were running full time with wood at $16 per cord, it would have made a fortune for the lucky prospector who had sense enough to investigate the peculiar black, shaly croppings over which many of them must have walked.

At present there is no demand for large amounts of fuel by any concern in that part of Nevada besides the Carson & Colorado Railroad; and as that company does not see business enough to warrant it in extending a spur to the mines (the management being in the wood business themselves), and as the coal at present developed could not compete in distant markets with a first-class coal, it is unlikely that any large amount will be mined for some years.

Except in case of a rise in the price of silver and a resuscitation of the different camps of Candelaria, there appears to be but one probable future demand for fuel in that section sufficient to cause the prospecting and development of these promising coal fields. About twenty miles to the south of them lies the old mining camp of Silver Peak. This would better have been Gold Peak, as it has been a producer of high-grade gold ore for years. This was largely gouged out of immense ledges of low-grade ore, which would not pay by the expensive methods of handling and milling in vogue there. There is little doubt that capital will eventually take hold of these properties on the large scale their great value justifies; and when it does so there will be a revival of gold mining in the outlying camps as well. This will make a market for a considerable amount of Columbus coal. As wood has become scarce and expensive at Silver Peak, the coal could be delivered in quantity in that town for $8 or $9 per ton.

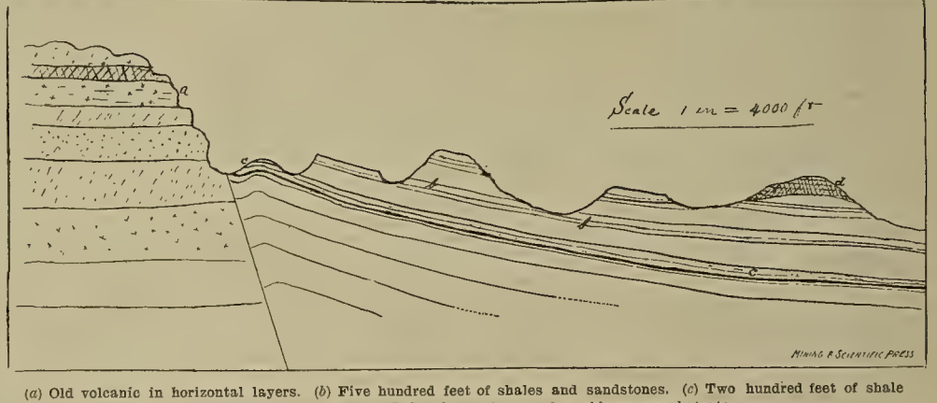
In view of the probable growth and importance of this section in the near future, a description of this coal field may be of interest to miners on this coast, as well as to geologists, owing to its rather interesting stratigraphical relations.

The coal is found in the lowest strata of a Tertiary lake bed series, now exposed by displacement along a line of faulting, as explained later.

There are two workable veins of coal outcropping, besides numerous bands of coaly shale. One of the veins is 1½ feet thick; the other, lying 200 feet deeper, is 5 feet thick. The latter lies in the middle of a 50-foot belt of coaly shale; and as it is the lowest strata outcropping the conditions seem promising for better developments by prospecting the deeper formations. The shales enclosing the coal dip to the north and northeast at low angles, and extend to the northwest, north and northeast. They are probably to be found under the whole of Columbus marsh, northwesterly. To the north they must be cut off (possibly by a fault line) at the base of a range of hills four or five miles distant.

To the northeast and east they probably extend under most of the level and rolling land in that direction for ten to twenty-five miles from the coal mines. There is an area approximating eight by twenty-five miles under which these strata extend. How much of this contains coal, and within reasonsonable distance from the surface, is a matter of conjecture; but the fact that in a well bored at Columbus, twelve miles from the mines, some years ago, some small seams of coal were found would lead one to believe that the extent of the coal land is considerable.

The development work done up to this date upon the coal veins is largely wasted energy, and consists of several inclines and shafts in the contorted portion of the field near the fault line. The work has been carried to a depth sufficient to show the character of the unaltered coal in this section of the veins.



The material furnished by the two veins mentioned is almost identical in composition, and is a compact, glossy, black, bituminous coal of a coking character, giving a firm, hard coke. The average analysis is as follows:

Fixed carbon	38½%
Volatile matter (including moisture)	31½%
Ash	30 %

The excessively high percentage of ash does not interfere with its free burning properties when properly handled, and it does not clinker on the grate. The coal cokes somewhat when burnt, but a little judicious stirring on an open grate overcomes this difficulty. A test of ten tons that was made by the Central Pacific at Reno on a locomotive gave very favorable results in every respect except the annoyance of several stoppages to clean the ash box. No clinker occurred, as there is almost no sulphur in the coal. It burnt freely with a long, hot flame, and, when fed evenly and the coke kept loosened on the grate, gave excellent returns.

As the high ash percentage is due to foreign matter—clay and sand, washed into the beds while the coal was being deposited—it seems probable that, if the field is extensive, good, clean coal can be found in some part of it. Any large demand for fuel in this section would justify extensive prospecting of the strata by deep boring. With only 10 per cent of ash this coal would have about 50 per cent of fixed carbon and 40 per cent of volatile matter, which, with its other qualities, would make it most excellent fuel.

The geological features of the deposit are interesting as well as important in judging the probable extent of the coal field. The accompanying sketch shown a cross section of the strata northeast from the coal outcrop:

(*a*) Old volcanic in horizontal layers. (*b*) Five hundred feet of shales and sandstones. (*c*) Two hundred feet of shale containing bands of coal. (*d*) Conglomerate unconformable upon coal strata.

The mountains formed by the volcanic strata (*a*) are the result of orthographic displacement along the fault line, in accordance with the "Great Basin" system of faulting fully described in a monograph of the United States Geographical Survey, 1885, by J. C. Russell, on the quaternary Lake Lahontan. The throw of this fault is at least 3000 feet, the steep escarpment of the many-colored volcanic cliffs being still 2000 feet above the coal strata. The fault line runs along the base of the range about north 70° east, dipping here about 75°. It shows at the coal mines as a 30-foot belt of clay gouge between the volcanic rocks and the shales. A half mile west are two low hills of hot spring deposit (aragonite), and about two miles farther are still existing hot springs—a proof of fault lines in this country, according to Russell, as well as strong evidence of some slight recent displacement.

The coal-bearing strata of shales and sandstones of every shade of pale yellow and drab are contorted and broken near the fault line, and dip here about 15° to northeast. Two miles away they are nearly flat to 5° of dip. On top of these strata is seen in places a coarse conglomerate wash of boulders of volcanic rocks, which is quite unconformable with the coal strata. The deposits of the Quaternary lake which filled Columbus marsh also overlie these Tertiary strata, and possibly to a great depth.

In the lowest coal strata there shows at one place a porphyritic volcanic rock, and a half mile west is a small body of basalt. As there has been considerable volcanic activity in this section since the displacement on the fault line took place, it seems more probable that these rocks are intrusive than that they are the underlying bed on which the coal was deposited.

Professor Walcott, director of the United States Geological Survey, recently took a flying trip to the Silver Peak mining district. He made a hasty examination of the coal field and stated that the coal strata corresponded to the Laramie series of Wyoming, in which extensive coal deposits are found, and which is a connecting link between the Cretaceous and Tertiary periods. Professor Merriam of Berkeley, however, determined as Tertiary, and probably Miocene, some fossil fresh water shells collected by the writer in the shales 50 feet above the coal measures. This would make the coal about the same age as the Coos Bay deposits; but, whatever the geological age, the quality of this coal will certainly be excellent if found free from ash in these strata.

It is to be regretted that this extensive deposit of fine fuel was not found and developed when it would have been of such great value in cheapening the cost of running the Candelaria mines and mills, and enabling those famous mines to continue to produce the white metal in spite of the action of Indian mints and international conferences.

Deep Shafts.

The following is a list of leading deep mining shafts in the world, as published in the London *Mining Journal:*

UNITED STATES.	*Feet.*
Red Jacket, Calumet and Hecla, Lake Superior	4900
Tamarack, Lake Superior	4450
Yellow Jacket, Comstock, Nevada	3123
California Mine, Colorado	2260

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: On the McMahen mine the shaft is down 100 feet and a crosscut is being run from that level to determine the dip of the ledge and the location of the permanent works.

Republican: From the first cleanup at the Argonaut the rock averaged between $11 and $12 a ton, nearly $10 of which was in free gold.

A recent assay of 40 feet of the 85-foot ledge of the Bellwether mine gave a result of from $7 to $18 a ton.

The diamond drill has been started at the Alma mine at the 1000-foot level, and the ledge has been struck 105 feet from the shaft.

Butte.

Mercury: At Cherokee, T. L. Vinton is working a crew of forty men on a portion of the old Spring Valley mining claim under a permit from the Debris Commission. The ground, which is very hard, is broken up by powder blasts, tunnels being run in on the bedrock to a length of 65 feet and the powder exploded in these tunnels. About 2500 pounds of powder is used in each blast. Three of these shots are exploded simultaneously, 65 feet apart and 65 feet from the face, and break up the ground for an area of 80x200 feet. The settling reservoir is located eleven miles below Cherokee on Dry creek and is kept in good repair, three men and a team being kept constantly at work. After leaving this dam the water is carried in the Cherokee canal and dumped into the tules where it can do no harm.

Register: Welsh, Sweetzer & Co. will begin opening a gravel mine on the land of P. R. Welsh in the lava bed country south of Oroville. This land was mined by the Chinese years ago, but on account of lack of powerful machinery they could not get down where the richest gravel lies.

Josiah Champion has his tunnel at the Oregon mine in 500 feet. This promises to be one of the greatest enterprises in Butte county. The ledge is from 13 to 14 feet wide in the upper tunnel. The rock is decomposed, handy to get at and there is no water to bother the men. Mr. Champion intends to put up a 25-stamp mill when he strikes the ledge.

Calaveras.

Mountain Echo: Bisbee & Rasmussen have struck a very rich body of ore that carries a large per cent of sulphurets. The ledge is about 40 feet wide.

Citizen: The Sugar Pine mine, on San Domingo ridge, has been bonded to McClay & Tretheway for $6000, $500 of which was paid down. The mine was recently discovered and is owned by Briseno & McDonald. A shaft 45 feet deep was sunk, exposing a 2-foot vein of rich ore.

Chronicle: At the Thorpe mine the working shaft, which is sunk off of the vein, has reached a depth of 600 feet. The vein was crosscutted at the 500-foot mark and the work of running the 600 level is now in progress with the prospect of finishing about the middle of next week, when sinking will again be resumed. The aim is to go down 700 feet, then open up the three levels and begin stoping. Fifteen men are at present on the pay-roll. The vein in the 500 foot level runs from ten to fifteen feet in width through in some places it is as wide as twenty feet. The rock in some parts of this will assay $12 to the ton. though taken on an average it shows a yield of about $7.

A new hoist is to be erected on the Bund mine and also one on the Burgess mine on the Rathgeb property. These mines are being operated by the California Exploration Company.

Work at the Emerson mine has been suspended temporarily. An increased flow of water was encountered and in order to handle the same additional machinery is to be erected.

A twenty day's run at the Infernal gravel mine in Chili Gulch, owned by Anthony & Cope, yielded $1,2 0. There are only six men employed and only development work is being prosecuted.

El Dorado.

(Special Correspondence).—Gravel mining is receiving attention in the neighborhood of Shingle Springs on rather a large scale.

Berry & Goff of Oakland are developing property in Quartz canyon, in the Georgetown section. They claim a ledge of low-grade ore 24 feet in width.

Work is progressing steadily on the projected electric power plant three miles from town on the American river. The property was bonded by Frank H. Page from Pearson Brothers for a New York company.

At the Eagle King mine, near Grizzly Flats, Melton & Witmer owners, a 4-foot ledge of high-grade ore was opened last week at a depth of 265 feet.

Mulkey & Spreckels have let a contract for 200 feet of tunnel in their gravel property near Fair Play. From a comparatively small open cut Mr. Mulkey took out $1032 last week. There are over 400 acres in the claim. It will be operated on an extensive scale.

John Kohlert has leased to four Oakland parties a stretch of country in which they are working old tailings. They are averaging $3 a day to the man. The property is located at Indian Diggings.

Estee & Dennar have bonded their gravel claim at Indian Diggings to Joseph Rodinea. A tunnel has been run 200 feet in good pay ground.

Mr. Sears of Stockton has bonded 180 acres from Mrs. M. French, four miles east of Indian Diggings. He has obtained a permit to hydraulic and will soon begin operations.

Seissenop & Hanley are doing well on their gravel claim just south of the Dalmatia mine, near Kelsey. In one day last week they took out $80, and on another day took out one piece that weighed $50.

The Chanced Upon quartz mine and 10-stamp mill in Kelsey were sold last week by P. G. Galpin and Mrs. M. Whitney of Oakland to Juan de Alvarado of London. Consideration $40,000.

The prospector in the employ of English and Scotch capitalists, the expert representing Eastern capital, and the mining man representing his own interests, are abroad over the county as was never recorded in the previous history of quartz mining in El Dorado. "Prospects" are receiving constant attention. Bonds are offered at very reasonable figures and on long time. El Dorado county has not presented so bright an outlook for quartz mining in thirty-five years.

The Grand Victory struck a new and rich ore body last week at the 300 mark of the shaft.

Placerville, Feb. 8th, '97.

The Darling mine, in El Dorado county, has been sold by Philip G. Galpin and Mrs. Mary F. Whitney of Oakland to Juan D. Alvarado of London for $40,000. The Darling has been idle for some time. Some ten years ago the late Senator Whitney and Mr. Galpin put up a 10-stamp mill and a steam hoist on the property.

Gazette: The Gold Bug Co have commenced building their new 8-foot flume in Canyon creek, and expect soon to be ready to take out gold.

Nugget: Tong and Ross of Clarksville are sinking a shaft on the Enterprise quartz mine in Marble Valley district. They have a 20-inch ledge.

At the Zentgraf mine the shaft is now down over 500 feet, or about 200 feet below the old tunnel. Sixty men are employed.

Gazette: At the Gentle Annie mine their 10-stamp mill is kept steadily at work crushing high-grade ore taken from the 300-foot level.

At the Grand Victory they are crosscutting from the bottom of their 300-foot shaft. In this crosscut they have encountered better and higher grade ore.

There has been a contract let at the Selby mine, Diamond Springs district, to sink the shaft 200 feet deeper.

The owners of the Griffith Consolidated mine, Diamond Springs district, are now sinking their main double-compartment shaft below the 150-foot level. It is their intention to sink to a depth of 600 feet before stoping.

At the Starlight mine, Logtown district, near El Dorado, the 10-stamp mill is running night and day on high-grade ore that is being stoped from the 200, 300 and 400-foot levels.

The Big Canyon is running steadily along furnishing ore to keep their 30-stamp mill and their chlorination plant at work all the time.

At the Larkin mine, Diamond Springs district, they are driving a crosscut from the 100-foot level east running for the ledge.

Inyo.

Register: J. W. Kelly has taken a force of men to commence development work on two groups of copper claims near Saline Valley. The first group, consists of the Copper Wedge, Tip Top, Copper Star, Copper King, Copper Queen and Clipper. The other mines include; Golden Eagle, Bismark, Bryan, Excelsior, Fairview, Standard, Butte and Summit. Assays from the Copper King, Star, and Tip Top show respectively 8 to 90 per cent, and 26 per cent commercial copper. All of these claims carry more or less silver with thousands of tons of ore in sight.

Kern.

J. R. Ellis of Frazier Valley, has sold his interest in the Rademacher to the Downing Mining Company of Visalia. They are working twelve men, running a crosscut, and have cut through 20 feet of good ore. They will sink a couple of shafts. The proposition of sinking for water is very encouraging. They are down 112 feet. So far water has not been struck, but the ground is very damp.

J. W. McNitt is milling thirty tons of rock at the Visalia Company's mill at Garlock.

Nevada.

Transcript: Preparations are being made to resume work at the old Blue Tent gravel mine, six miles north of this city. A restraining dam has been built, and recently a permit to hydraulic was granted by the Debris Commissioners. In former years a large amount of gold was taken from this mine. Experiments showed it would not pay to work by drifting. It is expected that everything will be in readiness soon to turn on the water.

Telegraph: Recently the W. Y. O. D. Company concluded to develop the easterly vein, and started a new shaft on the northerly extremity of the Parr claim. The shaft is now down over 300 feet in depth and an adit level run north about 100 feet to connect with a tunnel started from the surface for draining the mine. In addition to the work a tunnel has been run from the south side, 475 feet in length. The development on the back vein is very encouraging. A large vein of good ore has been encountered.

Placer.

Sentinel: The Central Mining Company at Deadwood has completed the new tunnel and will soon be operating through it.

P. A. Wagner, of San Francisco, has a bond on the property of the Sailor Consolidated Mining Company, comprising the Sailor, Sally, Alma and Hazel, through which the Canada Hill channel runs. Mr. Wagner secured the bond for a German syndicate.

The Glen Consolidated gravel mine, near Bald mountain, is paying well. The gravel pays from $4.50 to $5 per car. The gold is very coarse, and pieces of $5 and over are picked up in the breast.

Plumas.

National-Bulletin: C. D. Hazard has resumed work on the Plumas Imperial. Last fall the mine, ditches, dams, etc., were placed in readiness for a season of active work this year. The supply of water, owing to the late storm, is excellent. The Plumas Imperial is one of the most important hydraulic mining propositions in Plumas, possessing a large deposit of gravel, a fine water privilege and a large restraining dam and settling reservoir.

The pump at Thistle Shaft has been started. This was done merely to determine whether the water could be perceptibly lowered or not. That it could was demonstrated, but it is questionable whether the works could be emptied of the great accumulation of water at this season of the year. At any rate, work has been suspended, and it is understood that no effort will be made to resume till next spring. Whether the company will again attempt to work the rich mine through the shaft, or tap it by means of a long tunnel, is not known.

Shasta.

Searchlight: At Iron Mountain, where the ore is furnished for the smelter of the Mountain Copper Company, a rich strike was recently reported in the rock chute on the right, the ore showing a heavy deposit of native copper. About 300 men are now at work, which, taken with the 600 employed at Keswick, makes a total of 900 in the company's employ. About 500 tons of the ore are shipped daily.

Free Press: At the National Mill and Mining Company's property, in Churntown district, there are 34 men employed in the mill and mine. The former is running steadily on good ore and the latter is being developed as fast as possible.

The Hidden Treasure mine, on Slick Rock creek, together with the mill and water right, the property of the McCormick-Saeltzer Company, has been sold to the Iron Mountain Investment Company.

Sierra.

Mountain Messenger: Development work is being prosecuted in Slug Canon by Isaac Copeland, twenty men being now employed. The tunnel lately started to tap the old works in the Van Clief ledge had to be abandoned temporarily, on account of the heavy flow of water which was coming through the broken ground.

The 5-stamp mill which was lately constructed near Loganville by Mr. Copeland is running day and night on ore from the Bolivia.

Siskiyou.

News: The Klamath Flume and Mining Company will operate extensively in Happy Camp district. Their property consists of 1000 acres of rich placer ground.

At the McKinley mine they have 100 tons of high-grade ore, which will be hauled to the mill as soon as the snow gets off.

Parties are negotiating for B. G. Reeder's Bonanza mine in Fool's Paradise district. This mine has been worked only at a depth of 50 feet and a distance of some 300 feet in length, but about $12,000 were taken out by hand mortaring. Two hundred tons of ore left on the dump is supposed to go about $15 per ton. A stamp mill will probably be erected next summer.

Journal: George Warder is now crushing quartz from the Crowley ledge near Callahans, in a small stamp mill, with good results.

J. Fore has a force at work in placer mining at Callahans.

Work is progressing gradually on the Del Monte quartz mine at Humbug, owned by the Hearst estate. Good prospects were found in this ledge when first prospected.

Tuolumne.

Independent: Chicago men are about to purchase the Stanley mine, at Jacksonville.

The Black Oak mine is not sold, the parties bonding it having failed to make final payment.

The Gold Bug, a parallel east of the Draper, at Soulsbyville, has been opened by T. Whitto and a 2-foot vein discovered, giving a value of $100 to $150 in free gold. This vein is also a west parallel to the Black Oak.

Union-Democrat: At the Mammoth mine ten stamps are running night and day and new men are being put on as fast as there is room for them. It is reported that they have struck $40 rock on the 700-foot level.

Last week a 5-foot vein of very rich ore was uncovered in the Norwegian mine, near Robinson's Ferry. The mine was recently purchased from the Lawson's, whom it had made independently rich.

NEVADA.

Enterprise: Chinese and white men are working the Pro Bono Publico placer ground at the mouth of Six Mile canyon, raising gravel to the surface through shallow shafts sunk in the gravel at several points. So far no bedrock has been found and is not likely to be at the depth that can be sunk by windlass power, as a shaft sent down 113 feet at the placer where they are now operating, eighteen years ago, failed to reach bedrock. The entire plain east of town for a distance of five miles east of the mouth of Six Mile canyon, is a gravel bed of unknown depth, the bedrock not cropping out at any point on the plain.

White Pine *News*: At Cherry Creek V. G. Shepard has leased and bonded one of his mines in Granite district to Colorado parties, who commence operations at once.

Arrangements have been made by the Ben Hur Co. to ship boiler and other machinery for a 10-stamp mill, to be delivered on their mines.

Contracts have been made by the North Mountain Company for a boiler and other machinery.

OREGON.

Baker *Democrat*: Supt. Albert Geiser has come in from the Bonanza, bringing the output for the month of January, the amount being $10,000. The new engine and boiler, the former being 300 horse power and the latter double that capacity, together with ten additional stamps and other new machinery recently put in, are running well, and increased outputs may be looked for. The Bonanza will have forty stamps dropping by May 1st.

The incorporation has been affected of the Virginia Consolidated Mining Company under the laws of Nevada. The Con. Virginia mine is properly the south extension of the Virtue.

With continued depth the Virtue mine is richer than ever. So rich is the ore body and exhaustive at a depth of 700 feet that Mr. Grayson, the owner, is now contemplating the addition of twenty more stamps. This will run the monthly output considerably above the $30,000 mark, which has been credited to the Virtue for many months past.

Godfrey & Tabor, owners of the Red Boy mine, in Granite district, has shipped $4000 worth of gold bullion to the mint. The Red Boy has been a steady producer for the past two years, and to increase the output the owners propose the immediate enlargement of the mill.

The machinery from the Risdon Iron Works, San Francisco, for the French Flagstaff Mining Company, is arriving in Baker City.

Gold Hill *News*: Wm. Arthurs has purchased the W. A. Jones property on little Applegate, and will put a hydraulic plant on it.

Jacksonville *Democratic-Times*: Water is more plentiful than it has been, and the miners feel encouraged.

The Black Channel Company of Foots Creek district is building a number of ditches, flumes and reservoirs and will operate on a large scale.

The old Gold Hill mine, which produced a large quantity of gold in early days, is being developed by a crosscut aimed to strike the ledge at a depth of 250 feet.

It is reported that Ed Canfield of Galice Creek district has found the ledge for which he has been looking for a number of years.

WASHINGTON.

The Ivanhoe mine in the Okanogan country is about to commence shipping ore. They are now working on the 300-foot level and every shot shows free silver in the ore. There is now 1500 to 2000 tons of ore on the dump, the greater part of which could be shipped if Okanogan was blessed with railroad facilities. As it is, freight and treatment charges are $25 a ton.

It is reported that high-grade ore has been encountered in the Palmer Mountain tunnel.

Prof. Langhammer, who put the cyanide plant on the Wyandotte group, is now in Chicago forming a company to develop the Allison group, upon which he has a bond.

At Boundary the Legal Tender Mining Company is getting ready to commence active development work on its property, which consists of a group of six claims on Copper mountain.

At Kettle Falls Mr. Wise of Rossland has bonded the Rightside and has employed a number of men to develop it.

BRITISH COLUMBIA.

Review: At the Payne mine during December a total of 867 tons were shipped, while last month the product reached 1000 tons, even. This will net at the smelter about $100 per ton, and it is therefore safe to say that the mine has paid over $150,000 in sixty days.

The Silver Bell property, on the south fork of Kaslo creek, has been bonded by a syndicate represented by Frank Loring for $75,000, 10 per cent down.

There has been a strike of considerable importance recently made on the crosscut from the big tunnel of the Iron Mask. This was on the 210-foot level. The grade of ore is about $45 a ton. The clean ore body is about 15 inches wide.

Spokane *Chronicle*: The Skyline people at Ainsworth netted $26,000 from that mine in 1896.

The Salmon river country, in the Nelson district, is beginning to attract a great deal of attention. At present there are twenty mines working, despite the fact that there is considerable snow on the hills.

The Argo, a claim adjoining the townsite of Sandon, has been bonded for $25,000 to an English syndicate.

R. C. Campbell Johnston has purchased the Exchange group in the Slocan, consisting of four claims, for $31,000.

Negotiations are pending for the purchase for about $500,000 by the Vancouver and British Columbia Exploration Company of the Slocan Mining and Milling Company's properties, the Alamo, Cumberland, Idaho, Wild Goose, Corinth, Mocking Bird, Daybreak, Defender and Comet, situated in Alamo basin and on the divide between the south fork of Carpenter creek and Slocan lake.

The Bannockburn, Evergreen, Silver Bottom, Silver Reef, Iron Mask and Buckeye have been bonded to Ed N. Murphy for $50,000.

UTAH.

Salt Lake *Tribune*: The present output of the Bullion-Beck, which has already paid $1,967,000 in dividends, is reported at 300 tons a day. On the 800-foot level there is more ore blocked out now than can be marketed in a year, while that the chute is continuous from the 650 to the 900-foot level has been demonstrated.

At Mercur the property of the Gold King Mining Company has been bonded by James Haggin and his Eastern connections, and its systematic development will commence at once.

The report of the treasurer at yesterday's meeting of the Centennial-Eureka disclosed that during the past year ores have been produced of the value of $450,740.30, and that the dividends reached a total of $450,000.

At Mammoth the Swansea Tunnel Co. is being organized with a capital stock of $500,000. It is the intention to drive a tunnel into the mountain for a distance of 1000 feet, from which point a shaft will be sunk.

At Park City the great Ontario drain tun-

nel is within less than 100 feet of Daly No. 1. It is thought that with the completion of this great sub-waterway the old Daly, which has yielded its owners $2,887,500, besides a surplus of nearly $500,000 in the treasury, will take a new lease of life. Ore bodies that cannot now be reached on account of water will be worked.

Bingham *Bulletin*: In the 300-foot level of the Winnamuck, after running about 250 feet east from the main incline, ore has been broken into and it is coming in across the entire face of the drift. The winze sinking from the tunnel level is now 500 feet below the 200 and in solid ore, largely of shipping grade.

Mercur *Mercury*: On the 830-foot level of the Sunshine it is reported that a body of ore is being developed, running from $8 to $12 per ton.

A fine strike is reported in the Overland during the week, consisting of a 12-foot body of ore of good value.

The Herschel tunnel is now in 1340 feet and is being run with three shifts. The workings are in porphyry.

Tintic *Miner*: The Sioux-Ajax tunnel is now in 1700 feet.

Shipments from the district for the week are as follows: From the Bullion-Beck mine, 30 carloads ore; Centennial-Eureka, 10 carloads ore; Eureka Hill mill, 4 carloads concentrates; Ajax, 11 carloads ore; Mammoth mine, 7 carloads ore; Mammoth mill, 7 carloads concentrates; Carisa, 4 carloads ore; Sioux, 5 carloads ore; South Swansea, 5 carloads ore; Dragon iron mine, 1 carload ore daily.

IDAHO.

At Pierce the placer miners are feeling cheerful over the outlook for plenty of water for the coming season. Parties coming out from the mountains report the snow between three and four feet deep and still piling up. The interest that is being displayed in placer mining already indicates that this feature of mining will be pushed with vigor this year, and will result in the development of some large claims.

On Salmon river McFadden and Cooper have discovered a ledge of free-milling quartz nearly 40 feet wide.

MONTANA.

During '95 and '96 the Anaconda Copper Mining Co. shipped from Anaconda:

	1896.	1895.
Copper, lbs. fine....	125,350,693	99,775,294
Silver, ozs. fine.....	5,433,826.747	5,470,860 820
Gold, ozs. fine.....	17 411.3334	20,229.4498

In '96 the Boston & Montana Co. yielded about 60,000,000 pounds of copper.

Butte *Miner*: The Boston and Montana Company is increasing the ore reserves in sight. In addition to sinking 500 feet in two shafts, crosscutting and exploration work is being done in the other producing properties. Including over $300,000 construction charged to expense account, the Boston and Montana earned last year fully $19 per share on its capital stock.

The mill at the Hope mine in Basin, with a capacity of 250 tons of ore daily, will start up to-day.

White Cloud gold mine, five miles east of Florence, Ravalli county, was bonded by W. C. Tonkin of Thompson Falls for $18,000, $5,000 payable July 1, the remaining $13,000 Dec. 1. Tonkin also agrees to pay a royalty of 20 per cent on all ores extracted from the mine.

A rich strike of copper and silver ore has been made in the Receiver mine at the head of Horse canyon. At a depth of 220 feet a vein of copper ore was cut through in the shaft which goes 10 per cent copper and 22 ounces in silver to the ton.

Inter-Mountain: Word comes from Phillipsburg that the Combination Company will close down; that more than one-half of the miners have already been laid off and that the mill will finish the ore now in the bins in a week or so.

Helena *Independent*: The Merrell property has been purchased by C. McLure of the Granite Mountain and it is expected that operations will be resumed in the spring.

Mr. Essler has started up the Rimini concentrator to treat the Eureka dump. The mine is being worked by a small force and the ore is being shipped.

SOUTH DAKOTA.

Black Hills *Times*: The Horseshoe Mining Company's mines are now producing more ore daily than the Kildonan mill can handle, the capacity of which is now being doubled. When this is done it will be the largest chlorination mill in the world, and will handle from 200 to 250 tons of ore per day.

The Columbus Mining Company are advancing the drift from the 200-foot level of their main shaft to a connection with the old workings. It is now in over 400 feet. The ore body is evidently an extension of the Homestake.

The deal for the Carroll group of claims has been closed, deeds signed and first payment made, D. C. Boley and associates being the purchasers. The group consists of twelve locations situated on the Blacktail divide.

The Gold Queen Mining Company have resumed development work on their group of twelve claims, situated on Deadwood gulch, above Golden Gate.

Additional mining claims aggregating about 300 acres, situated in the vicinity of Garden City, have recently been included in the ninety-day option secured on other properties by C. L. Boon of Chicago. In the deal are now included the Kicking Horse, the Penobscot, the American Express, the Dalton and the Faust groups, also the property formerly owned by the South Dakota Mining Company, known as the Eva and Edna lodes, aggregating about 600 acres in all.

On the Union Hill Mining Company's properties the alterations of the old Richmond silver mill into a gold stamp mill are about completed, and it is expected that twenty of the sixty stamps will be dropping in a week or ten days. The mill will be equipped with four varieties of concentrators to test their capabilities and capacities. The contract for the new 200-stamp mill will be awarded about February 15th, the delay being caused by a change of the plans

The owners of the Hazel group of mines, adjoining the Golden Slipper property, are about closing a deal with Eastern parties, who agree to expend $10,000 in development work in consideration of a half interest in the property.

MICHIGAN.

The Calumet & Hecla Mining Co. in '96 yielded a total of 90,000,000 pounds of refined copper, the largest in its history.

The Atlantic Mining Co. hoisted 371,128 tons of rock in '96, which yielded 4,894,228 pounds of refined copper.

COLORADO.

CRIPPLE CREEK.

(Special Correspondence).—The New Ninety-six, on Gold Hill, belonging to the Mound City and Gold Hill Gold Mining Company of St. Louis, is being opened by the sinking of a shaft, drifting and crosscutting.

The Jack G., on Raven Hill, is under lease to J. R. Buchanan, whose shipments to the Victor sampler show ore values of $70 per ton.

The Marionet, on Gold Hill, shipped thirteen tons of ore one day last week which ran $25 per ton.

The Anaconda tunnel is in 4350 feet. At the breast an upraise of 500 feet will be put in to connect with the Kittie M. property (one of the Anaconda group). Shipments have been made continually from the Anaconda, but such shipments have been merely incidental to the work of development. A good deal of stoping has been done, and in the course of developments many veins have been cut, though comparatively little drifting has been done.

The Ingham mine, on Raven Hill, under the management of Supt. Lawton, has recently made building improvements and is doing some systematic development.

The Elkton, one of the best known mines on Raven Hill, has a 400-foot shaft and levels at each 100 feet. The first level runs 1100 feet north; the second 900 feet north and 125 feet south; the third 800 feet north and 280 feet south; the fourth 100 feet each way. Two station pumps, each 700 gallons per minute, serve to relieve the mine of surplus water. Ore shipments are now being made from the first and second levels and ore will soon be shipped from the third. No stoping has yet been done on the third and fourth levels. The Elkton now works about ninety men and three air drills are in use.

The Moose, located farther up the gulch from the Elkton, has been closed down for several weeks, though there is a rumor of soon starting up. This property has been a heavy producer, and, under favorable conditions, it will doubtless resume its former standing. The Moose shaft is down 680 feet and has twelve levels.

The Trail is a new property, which is being opened on the Elkton side of Bull Hill by Christopher and Lauterman. A new plant of machinery, consisting of hoisting apparatus, air compressor and five air drills, has been put in. A tunnel is being run in on the vein. Two shafts are being sunk, and from various points levels will be run.

The Last Dollar, in the course of its extensive developments, has been shipping ore in sufficient amount to pay the expenses of operating. The main shaft is down 375 feet, and ore is being shipped from the first level. December shipments amounted to seventeen carloads, of which 200 tons was high grade and 400 tons low grade.

The Orpha May, one of the big properties of Bull Hill, recently put in new machinery. The mine is shipping about twenty-four cars of smelting ore per month. At least, it has kept up this record for four or five months. As the facilities are now greater with the new machinery, its output is expected to be increased. The shaft is down 450 feet. About 100 men are employed here.

The Grouse, farther up the hill from the Orpha May, is busily sinking a shaft, which is down about 240 feet. Two levels have been run. This property has shipped ore for over a year.

The Theressa, on the south slope of Bull Hill, has put in a new plant of machinery—a 120-horse power boiler and two air compressors. The January shipments amounted to about 200 tons.

The Legal Tender, owned by the Golden Circle Mining Co., is a Bull cliff property. It has shipped 1000 tons of ore worth about $100,000.

The Christmas mine, near the Legal Tender, shipped 150 tons of ore in January. The ore is rated rather low grade.

The Lillie is being worked by the Foley Mining and Leasing Company, the latter having a one-year lease. About ten tons per day of high-grade ore is being shipped, which runs eight to ten ounces in gold. About 120 men are employed here.

The Pinto mine, belonging to the Free Coinage Company, is under lease to L. E. Reed & Co., and is being developed.

The Orphan Belle, on the east slope of Bull Hill, consists of four or five properties, under lease, ore shipments being made from each one. Very high grade ore is being produced. The January shipments from the Orphan Belle leases were 200 tons, which were high grade. Lessees here pay a royalty of about 25 per cent.

One of the most interesting group of properties on Bull Hill is the Isabella, consisting of the Buena Vista, Lee, Smuggler, Keith and Comet, of 160 acres on the east slope of Bull Hill. The properties, with shafts and shaft houses, form a continuous line. The Lee shaft is a model of construction and is a three-compartment, 4½x13 feet. By means of the work from this string of shafts the main vein has been opened continuously for 2100 feet and at a depth of 560 feet. It is stated that this vein is the same as that of the Victor mine, which adjoins the Isabella group on the south. The output is well graded. That designated as first class, which is very high grade, goes to the smelters for treatment; the second class to chlorination mills, and the third class to the cyanide works. A force of 185 men is employed by the company. The work of 1896 comprised 711 feet of shafts, 6048 feet of levels and 1801 fathoms of stoping. During that year the company hoisted 16,428 mine carloads of first-class smelter ore, 7088 cars of second-grade chlorination ore, 3017 cars of third-grade cyanide ore, 1571 cars of fourth-class waste and screenings and 15,516 cars of waste, making a total of 43,570 cars of material hoisted. The net profits for the year, according to the company's annual report, after deducting expenditures for running expenses and improvements, amounted to $220,114.

The Pharmacist, on the same hill, has two shafts. The depth of the old shaft is 655 feet, that of the new shaft 300 feet. Stoping has been done in all these levels. Shipments run about 150 tons per month of high-grade ore, low-grade shipments running about 150 tons per month. WASCOTT.

Victor, Col., Jan. 30, '97.

NEW MEXICO.

Silver City *Enterprise*: At Chloride Flat M. Taylor employs nine men on the Providencia and is making regular daily shipments.

At Pinos Altos Bell & Stevens are employing eight men on the Mina Grande. The drift from the south shaft to connect with the north shaft has been driven 275 feet, all the distance in ore. The Bell and Stevens mill is running steadily on ore from the Pacific.

The Golden Giant mine is working 35 men and running the mine one shift.

The Treasure Mining Company is working 50 men and running the mill night and day.

At Copper Flat the new smelting plant is nearly completed and will blow in before the 1st of March. Large ore reserves are developed in the mine and hundreds of tons of ore are on the dumps. About 50 men are employed about the mine and smelter.

ARIZONA.

Tucson *Star*: Many prospects which were known to be rich in copper have not been operated owing to the low prices being paid. In the Galiuru range east of Mammoth considerable work is being done.

At Greaterville the Rosemont people are putting up a whim and are working fifty men developing and taking out ore preparatory to blowing in the smelter.

E. Hughes is taking ore out of his copper mine and packing it over the mountain to the Rosemont smelter.

At the placers an increased output is the result of a new discovery and abundance of water.

MEXICO.

(Special Correspondence.)—The extension of the Mexican Central Railroad through the Amecan valley, Jalisco, has greatly increased the activity in the mining districts of the fifth canton of that State. Within two miles of Ameca, the terminus, are undeveloped deposits of both gold and silver ore, while a score of miles farther are rich copper mines. To encourage operations in this territory, the Department of Encouragement has appointed Senor Adolph Martinez of Ameca mining agent.

Exceptionally fine openings for mining investors are offered in the territory of Guerrero, northeast of Iguila, soon to be opened by the rapidly building Cuernavaca Railway. Ores from territory thereabouts, controlled by John F. Dawling and associates, assayed in November last 280 ounces of silver and 60% lead. Mr. Dawling expects to make his first shipments this month.

Capt. Miguel Bornio, of the La Planchas Mining Company, Sonora, has discovered a ledge of gold and silver-bearing ore about a mile from the works, measuring 5 feet in thickness and showing considerable distance. Assays have shown 40 ounces of silver and 2 ounces of gold.

J. Keefe Taylor, of the City of Mexico, has recently placed gold mining property in the State of Oaxaca with London parties; a silver mining investment in the State of Jalisco, near Ameca, with New Yorkers, and has two copper properties in Vera Cruz and Michoacin in negotiation with London and New York investors, respectively. At present Mr. Taylor is on the lookout for graphite property, which can be handled to advantage, if suitably located.

The French engineer, M. Maurite du Chatenet, is in Sonora, in the interests of French capitalists, looking into the merits of several mining properties about Cibuta owned by Senors Pierson and Holvilleur, of Mexico.

Boston capitalists are developing extensive mining properties near Unionde Tula, Jalisco, both gold and silver producing. Geo. H. Ellis of Chicago is superintending the operations.

The La Campa Mining Company, of Tucson, Ariz., are preparing to erect a 50-stamp mill on their mining property in Sonora.

The La Colorado y Las Prietas, operating in lower Sonora, have recently added two concentrating mills at their mines, for use in the cyanide process.

Unexpectedly rich showings are being made of late at the La Luz de Oro mines in Zacatecas.

There are several mines in Mexico that are reported to be extraordinarily rich in silver. One of these is in Sonora, where there is now enough gold in sight to keep the mills going for half a century. In the State of Durango Maximilian Dam has a similar property, while on the western slope of the Sierra Madre, in the same State, the International Mining Company, of which Senator Stewart of the United States is president, controls another.

Capt. Eugene Follette, of the City of Mexico, has secured, in association with other Mexican capitalists, valuable mining claims in the vicinity of Ameca, Jalisco, the ores from which assay from two to six ounces to the ton, gold.

In the territory near Tepic, Jalisco, for the last year the output of the Ahuacablan mine, in the district of Ixtlan, was 1620 kilograms of silver, value $55,922.49; 1250 kilos of silver sulphates, value $49,140.

John W. C. Maxwell of San Francisco, Cal., has been in Mexico for three weeks past on business with the Fomento department at the capital. He is also largely interested at several points in Lower California.

The Cincos Senores mines at Pozos, Guanajuato, showing 100 ounces to the ton, promise to surpass their satisfactory record of the past season. The Santa Brijida mine is also showing well of late—30% lead and 60 ounces silver.

A company is being organized at Monterey to develop recently discovered veins of silver two leagues west of that city, in the Mitras mountains.

Denver parties are negotiating for the purchase of the Las Catalanas mine of Maurice J. Cons, located in the Suiqui Grande jurisdiction, Sonora.

A new territory is being opened up in the State of Durango, about 140 miles west of the capital, near the Sinaloa line. La Providencia is the most prominent mine of this territory. Another district of promise lies some forty-five miles west of Durango, within easy reach of the Mexican International; Panuco de Coronado it is called.

Clarence King is again at the capital for a few weeks in the interest of a New York syndicate. The properties under consideration lie in Zacatecas and Guanajuato.

The Secretary of Fomento has ordered the several mining companies operating in the Corralitos mining district to suspend work upon that territory, concerning which they are in litigation with Senor Ramon Irigoyen; also to stop filling the shafts of the companies, not operating at present, with ores too poor for smelting.

The Rothschilds, who but recently secured the Bole copper mines in Lower California, are now negotiating through their representative, John H. Thurmann, for the purchase of the La Paz, Escarnacion and Espiritu Santo mines, that have produced copper for years in Chihuahua.

John B. Dickenson is working rich placer mines near Pihuma, Jalisco, some thirty-five miles from Colima, on the headwaters of the Belam river, a stream of considerable volume. On the side hills the soil has shown an average of from 50 to 60 cents per cubic meter, but in the gullies and the bed of the old river wash as high as $8 per cubic meter has been obtained.

Gold mining in the Minas Prietas district of Sonora is attracting general attention of late, because of the fine showing of the mines in operation. A great difficulty in this section is the lack of water with which to operate the mills. From this trouble the Colorado mine has been idle two years, although the Creston, close at hand, has been worked constantly, sufficient water being secured from the mine itself. Arrangements are being made to jointly bring a water supply from the mountains twenty miles away, which will probably be done by a system of canals.

In September last an English syndicate gave $1,000,000 for a three-quarter interest in the Los Amarillos and Grand Central mines, located in the Minas Prietas district of Sonora, and now they are eager to pay another million for the remaining interests therein. The output of the properties in October following the purchase was $300,000 in gold. The two mines are treating 100 tons of ore daily with two stamp mills, of twenty and ten stamps respectively.

Denver, Col., parties have just closed a deal by which they secure the Roscate gold mines, in the State of Oaxaca, at over $250,000, possion to be had about March 1st.

A syndicate, represented by Mr. Broderick of the City of Mexico, is negotiating for the purchase of the Copalguin mine in Durango, the reported figure offered being $4,000,000, of which $1,000,000 is to be paid down, upon privilege of six months' experimental working of the plant. If returns are satisfactory at the end of that time, the remainder is to be paid at once; if unsatisfactory, the $1,000,000 is returned to the prospective purchasers.

A powerful Mexican company is negotiating for the purchase of the mining property in La Piramicle, situated in the San Jose de Garcia district, Sinaloa, the reported price agreed upon being $1,500,000 (silver).

Recent results at the Flor de Maria mine, near the Sierra de Moctezuma, Chihuahua, district Bravos, show fifty ounces silver and 30% lead. The mines are about twenty-five miles from Moctezuma station, on the Mexican Central.

Official reports from the State government of Sinaloa show the principal minerals of the State to be gold, silver and copper. There are in operation six concerns of the first class, reducing 144,000 tons of ore, valued at $4,300,000, or $30 per ton; ten concerns of the second order, reducing 48,000 tons, at $50, amounting to $2,400,000; besides a number of smaller operations not considered. Results in the gold mining district of San Jose de Garcia are exceeding $8,000,000 per year.

The production of the mines of the Sierra Mojada region, Saltillo, according to the report of the Jefe Politico filed with Governor Cardenas, and covering the period from Oct. 1, 1893, to Dec. 31, 1896, was in total $12,887,227.71. This report dealt with twenty-three mines.

Extensive improvements will be observed the coming season at the mines of the Neuva Parena Mining Company, operating the Almania and Parena mines near Monterey, in the Sierra la Ventana.

The Michoacan Mining & Milling Company, operating near Coalcoman, on the upper western spur of the Sierra Madre del Sur, are preparing for extensive increase in their operations the coming season.

Scientific Progress.

Calcium Carbide: A New Reducing Agent.

Since the introduction of this remarkable substance it is significant that scientific men have been content to allow the product to rank solely as a water decomposer, and thus regard the production of acetylene the only available product.

Researches of a somewhat lengthy description, which have lately been carried out at the above laboratory, involve the use of calcium carbide as a metallurgical reducing agent.

In the first instance an excess of litharge was heated to redness in contact with the carbide, in a clay crucible, the reaction being accompanied by vivid incandescence, resulting in the formation of metallic lead and calcium oxide, CaO.

A further portion was now selected, in which the proportion of carbide excelled that of the litharge; this was further subdivided into various smaller portions, each portion being exposed to various temperatures, resulting in a regulus of calcium and lead of varying percentage, together with the expulsion of CO_2.

The alloys thus formed are more or less brittle, and to a certain extent sonorous when struck, their melting point ranking below that of pure lead, and are slowly, but completely, decomposed in contact with aqueous vapor, the reaction being much less energetic than that afforded by alloys of lead with the alkaline metals. Stannic oxide, cupric oxide, and also ferric oxide, at corresponding higher temperatures, were readily reduced, yielding results of no practical value; in the case of the cupric alloys those samples containing under 1 per cent of calcium being rendered cold-short and breaking under very small strain, whilst, on the other hand, iron containing calcium approaches in appearance that of ferro-manganese, being even more brittle and very oxidizable in contact with water.

In a further operation oxides of manganese, nickel, cobalt, and even chromium, molybdenum and tungsten, were readily reduced, yielding calcium alloys. Results of experiments, comprising the reductive action of the carbide upon the earthy chlorides and their haloids, will be shortly to hand. The already partial success of these reactions seems to point most conclusively towards a new and powerful reducing agent, which at the same time, considering the market value of the carbide in question, could not fail to replace both sodium and potassium.—H. N. Warren in Chemical News.

Tetanus Antitoxin.

Consul General Frank H. Mason, writing from Frankfort-on-the Main, says that from the evidence presented it would appear that tetanus, if not already conquered, is in a fair way to be successfully overcome. In the *Deutsche Medicinische Wachenschrift* (Berlin) for October 23rd appears a joint announcement by Prof. Dr. von Behring of diphtheria-antitoxin fame and Prof. Knorr of Marburg, describing the qualities and best methods of using the new tetanus antitoxin, which is now prepared under Government supervision as a commercial product by the Farbwerke at Hoechst-on-Main, and offered for use by medical practitioners under the same conditions as diphtheria antitoxin from the same source.

Tetanus, as is well known, is an exceedingly painful and hitherto usually fatal disease caused by blood poisoning, generally the result of a wound. It is believed by physicians to be caused by the introduction into the system of a minute organism which rises from the ground in certain localities, so that the prevalence of tetanus varies greatly even in different districts of the same country. At all events, the disease has its characteristic microbe, which has been recognized, isolated, described and reproduced by artificial culture. The distinctive symptom of tetanus is a persistent spasm of the voluntary muscles, aggravated by light, noise or other disturbing influence to which the patient may be subjected. These spasms may affect any muscular portion of the body, but when, as is often the case, the maxillary muscles are principally attacked, the resulting malady is known as lockjaw.

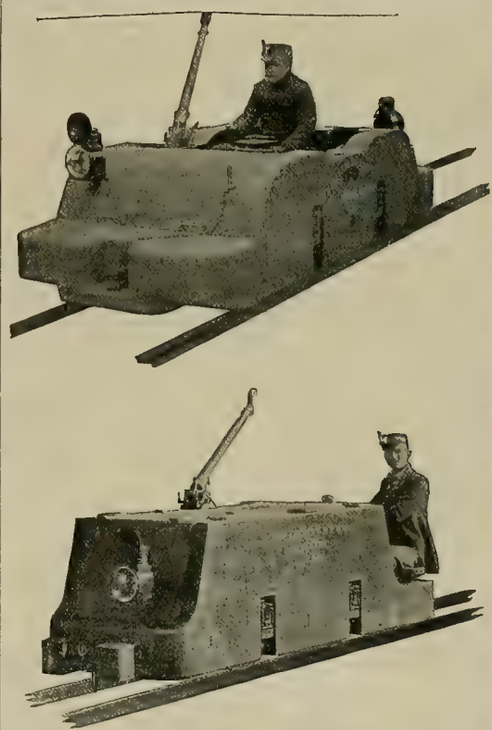
The tetanus antitoxin described by Profs. von Behring and Knorr is similar in nature, action and in the methods of its preparation to the antitoxin of diphtheria.

THE penetrating powers and ranges of powerful lights, such as are employed in lighthouse service, rapidly decrease as the ratio of their luminous power increases. For instance, a light of 5,000,000-candle power in the British channel has in average weather a luminous range of about forty-four nautical miles, while if the light be increased to the power of 10,000,000-candle the luminous range is only five miles more, or forty-nine miles. According to current practice, lights up to 200,000-candle power are obtained by means of mineral oil lamps, while electric lights are used for higher powers, and almost any power may thus be obtained. The highest power yet attempted is about 36,000,000, at Penmark point, in the department of Finisterre, France, which, when completed, will be the most powerful lighthouse illumination in the world. The height of the tower in which it is to be located is about sixty-three meters, enabling it to be seen during the day from a distance of eighteen miles in fine weather. During the night this light will be visible for sixty miles. The rotundity of the earth will prevent the rays from striking the eye directly at a distance of more than thirty miles, but the sky overhead will appear illuminated for thirty miles more. The estimated cost is about $120,000.—Machinery.

HENRI MOISSAN finds that important alloys can be obtained by taking advantage of the ease with which metallic oxides are reduced by aluminum. His general method appears to be to bring aluminum into a molten condition, and then to throw into it a mixture of aluminum filings and of the oxide of the metal which it is desired to alloy. A further energetic development of heat takes place, with the result that the most refractory oxides are reduced. By means of this method Moissan has succeeded in preparing alloys of aluminum with nickel, molybdenum, tungsten, uranium, titanium and chromium. The advantage of mixing tungsten, etc., with steel is well known, and Moissan states that not only this substance, but titanium also, can be introduced into Siemens-Martin steel. Many chemical substances when heated in the electric furnace give some very astonishing results, and in some cases they become transformed into minerals which up to the present have only been met with in nature.

THE late Dr. Alfred Nobel's bequests should do much for the progress of science. At any rate, magnificent rewards will accrue to the best discoveries. According to the terms of his will, a fund is to be formed from all his realizable property, the yearly interest from which is to be divided into five equal portions. The first of these is to be allotted as a prize for the most important discovery in the domain of physics. The second is for the principal chemical discovery or improvement. The third is for the chief discovery in physiology or medicine. The fourth is for the most distinguished literary contribution in the same field, while the fifth is to be allotted to whomsoever may have achieved the most or done the best to promote the cause of peace. All these prizes are open to Scandinavians and foreigners alike. After deducting a few bequests to individuals, it is expected that the fund thus devised to the cause of progress will amount to the sum of 35,000,000 kroner, or nearly $10,000,000.

Electrical Progress.



Jeffrey Coal Mining Machinery.

The illustrations herewith represent some of the Jeffrey specialties in the line of coal mining machinery. The words "Jeffrey" and "Successful power coal mining machinery" are synonymous, and, while the mining public in general are familiar with their manufacture, we illustrate herewith their latest coal cutter and mine locomotive, which are the culmination of many years of experience. The chain coal cutter, in simplicity, efficiency and design, is claimed by the manufacturers to be superior to all other makes. The machine is operated by electric or air power, and the daily work will average anywhere from 100 to 200 feet face, the undercut being either 5, 6 or 7 feet, according to the length of machine used.

THE JEFFREY COAL CUTTER.

The Jeffrey mine locomotives, wherever used, are reported to effect a great saving in the cost of production, the illustrations herewith showing the style made by that company. The one with man in center is preferred in many instances, while the one with controller on end is equally desirable. These locomotives are used for mine as well as surface work, and are designed for various capacities. The Jeffrey Company issue a complete catalogue descriptive of their machinery, which can be had by addressing them at Columbus, New York, Chicago or Denver.

JEFFREY MINE LOCOMOTIVES.

Incandescent Lamps.

The making of an incandescent lamp requires more than thirty distinct processes, most of which affect its quality rather than its appearance. The character of the filament, the way it is flashed and the exhaustion may generally be said to have most to do in determining the quality, but the defect in a lamp may be traced to a defect in either the filament, the glass, the platinum, even the base, or due to poor workmanship in any of the several processes in putting them together.

As light is the only useful product, the incandescent lamp may be said to have a real efficiency of from 3 to 5 per cent, the rest being wasted in heat. An incandescent lamp may be operated at such a low voltage as to give heat but no light. The filament that will stand the greatest degree of heat without vaporizing, other things being equal, is the best.

It is customary to state as the efficiency of an incandescent lamp the watts of energy required to produce one candle of light. By increasing the voltage we increase the light more than in proportion to the increase in the energy consumed and the lamp is then said to be more efficient. For example, a lamp giving 16-candle power of light at 100 volts pressure and consuming 56 watts of energy we would call a 3½-watt lamp. If we should increase the voltage to 110, the candle power would be increased to 28, the energy consumed to 70, the watts per candle would then be 2½ and we would call it a 2½-watt lamp. There is no difference in the lamp itself between what is termed a 2½-watt lamp and what is termed a 3½-watt lamp.

As lamps are operated at a higher efficiency, their defects become more apparent. If one is satisfied to operate a lamp at an efficiency of 6 or 7 watts per candle (and such lamps are made and sold), what is in reality a very bad lamp may give a customer good satisfaction.

The life of an incandescent lamp will be shorter as it is operated at a higher efficiency, or in other words at a higher voltage. For example, if at 3½ watts a lamp would have a life of 2400 hours, at 3 watts it would perhaps have a life of 1000 hours and at 2½ watts a life of 350 hours.—F. S. Terry, before the Northwestern Elect. Ass'n.

Ocean Telephony.

The following interview with Thomas A. Edison is taken from the New York *Herald*. Mr. Edison was first asked:

"If you were backed by a $10,000,000 syndicate, would you undertake to construct a practical working telephone across the Atlantic ocean?"

"It is impossible," he replied.

"There is a Russian who has telephoned under ten miles of water, and who claims that he can easily telephone across the Atlantic ocean. He is being backed by a syndicate and it is said that work will shortly be commenced on a submarine telephone cable."

Mr. Edison figured a little, and said:

"The difficulty of telephoning increases according to the square root of the distance. He telephoned ten miles under water, did he? Well, he must have had some little trouble. At ten miles his difficulties are, we will say, one. At twenty miles his difficulties would be four. Then they would run up as follows:

At 40 miles	16 times as hard;
At 80 miles	64 times as hard;
At 160 miles	256 times as hard;
At 320 miles	1,024 times as hard;
At 640 miles	4,096 times as hard;
At 1,280 miles	16,384 times as hard;
At 2,560 miles	65,536 times as hard.

"This is about the distance across the

Atlantic ocean. Now, if that Russian can overcome a job 65,000 times as hard as telephoning under ten miles of water, he may possibly telephone across the Atlantic ocean. It is not a question of battery, but of leakage and the overcoming of resistance and the impossibility of getting rid of the current at the moment the voice ceases. Such a distance, especially such a submarine distance, affords entirely too clumsy a channel for the quick and variable current necessary to a telephone wire. As I said before, it is not a question of battery. Why, with the battery now on the Alantic cable I can run a fan motor at either end. At the same time the speed of the motor could not be varied quickly enough to make its starting and stopping a matter of a few seconds. Taking these things into consideration, I am afraid the eminent Russian has a heavy job ahead of him. If I could erect poles three miles high I would undertake to telephone around the earth. As you approach the earth, however, the difficulties increase greatly, and they are of such a nature that I am afraid they can never be overcome—at least, not with present human intelligence."

Electric Power in Gold Mining.

In the gold mining districts of western Australia, particularly the Coolgardie region, the Westralian Electric Company proposes to follow the example of California and Colorado, and apply electric power transmitted over long distances.

At the Rand Central Electric Works, which applies electric power to the gold mines of the Rand, South Africa, the capacity of the plant, about 2000 H. P., has been applied for at an average of about £45 per H. P. per annum delivered, including wires and fittings. There are four three-phase generators in position, direct driven by vertical triple expansion marine type engines, having a maximum brake H. P. of 1200. Each dynamo weighs eighty tons and is constructed in four pieces. Eight multi-tubular boilers, with 200 tubes each, supply the steam. Each is of 600 H. P. and has 3300 square feet of heating surface. Only three sets of the plant will be worked at first, the fourth being held in reserve for a time. Some of the mines supplied are situated over twenty miles from the generating station. Current is generated in the dynamos at 700 volts, is raised by means of step-up transformers to 10,000 volts, and at the mines is reduced by step-down transformers to 120 volts for lighting and 240 to 500 volts for motor work.

D. TOMMASI, in a paper published in *Moniteur Scientifique*, describes a new process of electrically separating and refining metals, of which the following is a brief abstract: The anodes are either cast plates or granulated material, resting in direct contact with the positive leads. The cathode is a vertical disk, capable of rotation about its horizontal axis. Only the lower portion is immersed in the electrolyte, and the upper part is passed during rotation between scrapers that effect the removal of any spongy deposit, transferring it to channels by which it is conveyed to a convenient receptacle. The disk is constructed in replaceable sectors, when a reguline deposit is to be obtained, and the sectors are one by one removed mechanically as they attain sufficient thickness, and are plunged beneath a fluid bath of the metal under treatment until the deposit has been melted away and the sector is ready for use again. A solid disk is preferred for spongy deposits. The advantages of this arrangement are that polarization is prevented by the rotation of the cathode and by the action of the scrapers, and the liquid is sufficiently agitated to prevent separation into layers of different density, whilst spongy deposits are removed as fast as they are produced, thus preventing oxidation by the liquid and the occurrence of local action. At the same time the electrodes may be allowed to approach more closely, owing to the impossibility of short-circuiting through irregularity of deposit, and the resistance of the bath is therefore sensibly diminished.

Mechanical Progress.

The River Dredger.

The following is a general description of the dredger which it is proposed to use in the Sacramento river:

The machine will go through a sandbar at a speed of from five to ten feet a minute, cutting its way through a solid bank and leaving behind it a channel forty feet wide and twenty feet deep. Of course, it could not do its work at such an amazing rate as this if it were not for the water which it has to work with. That is the secret of the whole performance.

In front of the machine are six intake pipes, turned downward. Surrounding each of these is a cylinder fitted with knives, which is kept in revolution all the time, so that the knives cut and chew up the sand and mix it with the water. This process, it should be remembered, goes all around the intake pipes, and in these pipes the suction of great steam-driven centrifugal pumps is pulling away at the loosened mass of sand and water. It is easy to imagine the result. Great solid streams of debris flow in the pipes at a rapid speed. The hydraulic engineers have calculated the speed to a nicety. They know to the fraction of a foot what speed the current must have through those pipes in order to carry the sand in solution.

Thus the problem of maintaining a channel in the Mississippi river at low water is solved. Where there is now but four and one-half feet of water in the autumn there will be, after a few of these dredges have been put to work, fourteen feet. In two years it is possible to have fourteen feet of water from St. Louis to the sea every day in the year. Five hydraulic dredges will do the work if employed four or five months a year at a cost of $10,000 a month each. This is almost magic—modern magic.

The significance of this achievement is that the problem of maintaining low-water navigation in all alluvial streams is solved. It is applicable to the Missouri, to the Illinois, to the Sacramento, to the Volga, to the Danube, to the Dnieper, to the Hoogly in India, to the La Plata, to rivers in all parts of the world. It is thought that no invention or achievement since the development of steam navigation has done as much for water transportation upon rivers as this successful application of hydraulics to river-bed dredging will do in the near future.

Carbolic Acid for Tempering Steel.

M. Levat recommends in *L'Industrie* the use of carbolic acid for tempering steel tools. In testing two cold chisels, he tempered one in water, the other in a solution of carbolic acid, after both had been heated to a cherry red. The chisels were set to work on extra hard wrought iron. The one tempered in water became notched after a short time, the one tempered in carbolic acid remained perfectly intact. The second test was made with two puddle steel bars, which were heated to white heat and tempered in water and carbolic acid respectively. The bar tempered in carbolic acid showed a much finer fracture, which reflected like a mirror when filed. The carbon contents were not increased, but in the bending test the bar tempered in carbolic acid showed more elasticity and pliability than the other, while its hardness made it more suitable for tools, as chisels, drills, etc.

WM. EVANS of Silver Bow, Montana, personally acquainted with the risks of a miner's life, has interested himself in an attempt to protect them from liability to accident by the introduction of a bill in the Montana Legislature providing that all cages in mines over 300 feet in depth shall be cased in. Heretofore the casing in of cages has been considered impracticable by many mining men, but he figures that the change can be accomplished with little cost. He says that a steel, iron or wire casing can be attached to any cage at a trifling cost. The casing might be swung on hinges or on rollers and should be 5 feet high. The doors might be made to swing inward, so that they could be fastened when ore was being hoisted. Another section of his bill provides that the safety dogs be inspected at stated and frequent intervals and kept in good order.

A FRENCH inventor is reported to have formulated a scheme to insure the safety of trains traveling in the same direction on the same line of rails. Briefly, the appliance consists of a series of electro-magnets, which operate the whistle and the automatic brake, by which means a given distance can be maintained between the trains. In connection with these are appliances which give an approximate idea of the distance of one train from the other. It is said that warning can be conveyed to a distance of from 600 to 1000 meters, and that the system is applicable to points and level crossings.

Practical Information.

Eastern Chinese Railway.

The details of the agreement between Russia and China regarding the construction of a Chinese eastern railway has been reported to the State Department by Consul General Karel, at St. Petersburg. The articles of association of the new company were sanctioned by the Czar in December last, and by an imperial ordinance issued December 23rd. The details of the arrangement are in the main as follows:

The association has been organized under a convention concluded August 27th, 1896, by the Chinese government for the construction and exploitation of a railroad within Chinese territory from a point on the western frontier of Heilung Chung to a point on the eastern frontier of Kirin, and to be connected with the Russian-Siberian line. The company is granted concessions to work coal and other mines and to conduct industrial and commercial enterprises in China in connection with the railroad, or separately. An important stipulation provides that shares can be held only by Russian and Chinese subjects. The company will own the road eighty years after the opening of the whole line. The Russian government guarantees the resources of the company to the extent of making obligatory the payment of shares. The capital stock of the road has been fixed at 5,000,000 paper roubles ($2,570,000), divided into 1000 shares, but bonds will be issued as required. The company must begin work in August, 1897, and the line is to be completed in six years. The total length of the Manchurian line will be 1273 miles, of which 945 is in Chinese territory, and it saves 341 miles over the old line to Vladivostock.

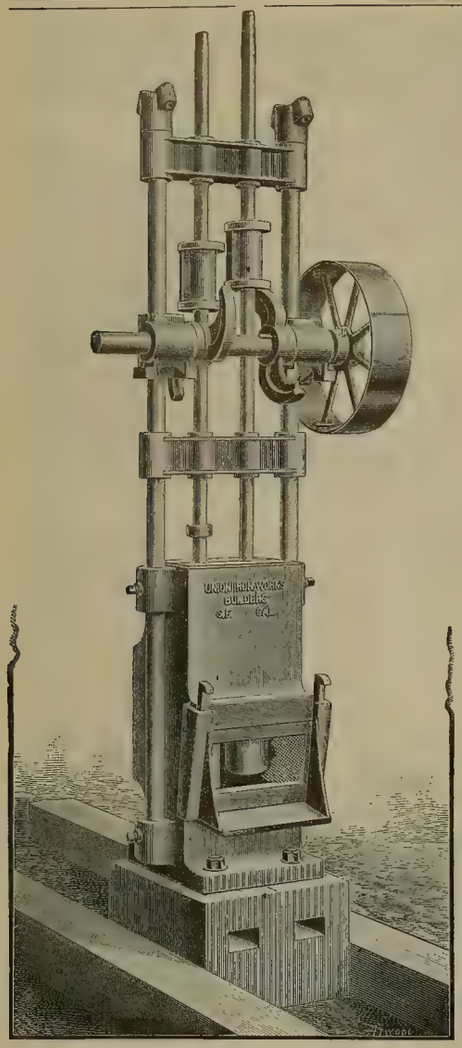
Aluminum on Warships.

Experiments at the imperial navy yards at Wilhelmshafen have shown conclusively that aluminum cannot be used practically in men-of-war construction, while aluminum bronze has turned out satisfactorily in many cases, when the alloy contained 94–96 per cent of aluminum and 6–4 per cent of copper. After investigating and testing aluminum in certain parts of vessels the following conclusions were arrived at: Aluminum bronze is useless for bearings, valves, etc., on account of the rapid wearing away; it has been found useful, however, for various parts of machines where friction is not an important factor, and also in cases where light weight is an object. Furniture made of aluminum showed decidedly too little resistance and required frequent repainting. Aluminum shows, furthermore, but little resistance to sea water, thus making it useless for the walls of vessels. A 10 per cent aluminum bronze, however, stands a fair chance of being freely used as soon as the price of aluminum can be sufficiently reduced to approach the value of cast steel.—Engineering Magazine.

ACCORDING to statistics recently furnished by Dr. James Wood, of Brooklyn, of all the patients applying for treatment at the chief dispensary of that city, no less than 10 per cent are tea drunkards. They are not aware of the fact, but the symptoms of their cases point unmistakably to over-indulgence in tea, and that presumption, on inquiry, is confirmed by their confessions. They suffer from headache, vertigo, insomnia, palpitation of the heart, mental confusion, nightmare, nausea, hallucinations, morbid depression of spirits, and sometimes from suicidal impulses—surely a formidable list of symptons. These patients are of both sexes and all ages, and confess drinking from a pint and a half to fifteen pints of tea each day.

IN Belgium a good deal of attention is being paid to the question whether incandescent gas lighting cannot be made more intense by auxiliary means, such as raising the pressure of the gas in blow-through burners by means of small hot-air motors, carbonic acid motors, or turbines and compressors driven by town water. The result is at present doubtful, for it is a question whether the gain is not more than counterbalanced by the increased cost and trouble.

THE Niagara electric power plant may be outdone in Africa. It is proposed to utilize the water power of the Victoria falls, on the Zambesi river, with the object of using the power to generate electricity and supply it to the various centers of population throughout Rhodesia, either in the form of power to work stamps and mills or of motive power for other purposes. Dr. Hopkinson and Professor Forbes have reported favorably on the scheme.



THE British and Australian sovereigns are 18-carat fine and are now both exactly alike. In 1870 a process was adopted in the Sydney mint, so that all the silver is now taken out. Sovereigns coined in Sydney before 1870 are of a light color and easily distinguishable from British sovereigns, simply because all native gold contains more or less silver; and this was retained in the coin until means of removing it were adopted.

BEFORE the Isthmus of Suez was pierced by the canal there were scarcely any sharks in the Mediterranean, the passage through the Straits of Gibraltar not being to their liking. Now, however, they come in by way of the canal and in such numbers that in more than one watering place on the Mediterranean, and also on the Adriatic, the sign has gone up: "Beware of sharks."

HERR LAUR argues that petroleum originates in the decomposition of subterranean carbides by water, so that the process must be a continuous one. Such carbides as that of aluminum would favor the formation of natural gas; such as that of uranium would favor that of liquid products. The nitrogen in crude petroleum would, on this view, not be of animal origin, but would be due to nitrides.

GERMANY seems to be forging ahead in the race for industrial greatness, if not supremacy. She already stands second among the nations in the value of her exports and imports. Official figures put her exports and imports for 1895 at $1,926,729,000; England's were $3,125,820,600; France's $1,366,167,600, and the United States' $1,544,770,000.

WE are all anxious to discover a true weather indicator—one that is strictly up to date. Not many know of the following method: Go out and gaze upon the smallest cloud you see; if it decreases and disappears, it shows a state of the air that is sure to be followed by fair weather; but if it increases, you may expect rain.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

CALIFORNIA ELECTRICAL WORKS.

Dynamos, Motors, Hoisting Apparatus, Arc and Incandescent Lamps, Instruments, and General Supplies.

TELEPHONE AND LINE CONSTRUCTION. LONG DISTANCE POWER TRANSMISSION A SPECIALTY.

Office and Works: 409 MARKET ST., SAN FRANCISCO, CAL.

OF SAN FRANCISCO.

ROOM 1, - 426 CALIFORNIA STREET, SAN FRANCISCO.

Coast Industrial Notes.

There will be launched to-day in Seattle, Wash., from Moran Bros.' establishment, the Government revenue tug Golden Gate for use in this harbor. The Golden Gate is the first steel vessel built on Puget Sound, and the launching will be an affair of a semi-official nature.

President Edgerton, head of the Scotch syndicate which is to dam the Rio Grande near Fort Selden, N. M., has gone to London to present his final report to the capitalists who are back of the enterprise. With two possible exceptions this is to be the largest water storage reservoir in the world. It will cost nearly $2 000 000 and will irrigate 200,000 acres of Rio Grande valley land between Fort Selden and El Paso.

The San Francisco and San Joaquin Valley Railroad Company has let a contract for grading south from Fresno, a distance of 30 miles, to Hanford. The directors have decided to build the Hanford extension to Bakersfield before the line by the way of Reedley and Visalia to Bakersfield, but work on the latter extension will be started as soon as rights-of-way disputes are settled. According to the contract, grading must be completed by June 17, 1897.

Personal.

HARRY B. ADSIT has been appointed general superintendent of the Tomboy mine at Telluride, Colorado.

JOHN BYRNE of Butte, an experienced miner, has been appointed State Mine Inspector by Governor Smith of Montana.

T. J. NOLTON has been appointed superintendent of the Klamath Flume and Mining Company, in Siskiyou county, California.

FRANK W. PAGE, of the Summit Mining Company, which recently paid $50,000 for the Fortuna mining claims, near Nevada City, Cal., will put an electric plant thereon.

A. D. SCHINDLER, who has been chief draughtsman for W. B. Storey, chief engineer of the San Francisco and San Joaquin Valley Railroad Company, has been appointed division superintendent at Stockton.

PRINCE FEDOR SHADRIN, who owns large placer properties in Russia, and M. Shagoloff and M. Krasilnichoff, who are engineers, have been looking into the methods in vogue in the hydraulic mines of Trinity county, California.

R. A. F. PENROSE, president of the Pearce, Arizona, G. M. & M. Co., is in San Francisco to get considerable machinery for the mine. The property has paid from the start. It is fourteen miles from Bisbee and will be thoroughly equipped.

Commercial Paragraphs.

WHILE the Link-Belt Machinery Co., Chicago, are not at the present time overcrowded with work, they are running their regular force full time. During the past few weeks a gradual improvement has developed and the signs point to increased activity in all departments within a short time. They have, among others, closed contracts with the following concerns: Gilmour & Co., Trenton, Ontario (the largest saw mill in Canada), one 750 H. P. rope drive, which includes one 14-foot fly wheel, shears (weight 40,000 pounds), etc.; C. T. Roenitz Leather Co., Sheboygan, Wis., 235 H. P. rope drives; Baltimore & Ohio S. W. Railway, Zaleski, Ohio, complete coal washing plant, including crushers, screens, elevators, conveyors, etc., having a capacity of cleaning 450 tons soft coal per day; and are now completing the installation of a 600 ton coal washing plant for the Crabtree mine of the Alexandria Coal Co., Greensburg, Pa.

THE Mine and Smelter Supply Company, Denver, Colo., have recently put in Wilfley concentrating tables in the Standard concentrating mill at Wallace, Idaho. They report having shipped four of these tables to Georgia.

Recent California Mining Incorporations.

Sliger Con. G. M. Co.; P. Maslin, W. H. Brown, E. A. Curtis, C. W. and W. P. Keeney; capital stock, $100,000—$50,000 subscribed.

Excelsior Mining Co., San Francisco, Cal.; capital, $100,000—$3020 subscribed; D. A. Donelson, C. Williams, A. T. Sherwood, G. T. Emery, J. B. Whitney.

Deseret G. M. & M. Co., Los Angeles, Cal.; capital, $100,000—$96,000 subscribed; J. W. Park, Banning; R. E. Dill, F. L. Hossack, D. D. and G. W. Whitney, Los Angeles.

Black Hawk Gravel Mining Company, San Francisco, Cal.; capital, $100,000—$45 subscribed; C. H. Crocker, B. B. Brewer, F. A. Smith, H. O. Wiedero, J. W. Rooch, San Francisco.

Recently Declared Mining Dividends.

Utah Mining Co., Utah, 2 cents per share, $2000; total to date, $175,000.

Silver King Mining Co., Utah, 25 cents per share, $37,500, February 8th.

Silver King, Utah, $37,500; payable Feb. 8. The payment of this dividend, which is the second that has been posted the present year, will increase the total to $937,500.

Cripple Creek—Its History to Date, Illustrated. Just out, with correct map and costly full page views natural as life. This great book will be sent free prepaid with our big 56-col. family paper 3 months on trial for 25c (stamps or silver); club of 5, $1. Latest mining news. Double-Jointed Ball-Bearing Hydraulic Giants.

The above presents an improved **Double-Jointed Ball-Bearing Hydraulic Giant** which we build. The improvement consists of the introduction of a **Ball Bearing** by which the pressure of the water is reduced to a minimum and the direction of the nozzle changed at will with ease.

Catalogues and prices of our specialties of HYDRAULIC MINING MACHINERY furnished upon application. **JOSHUA HENDY MACHINE WORKS, 38 to 44 Fremont St., San Francisco, Cal.**

A Great Mining Triumph.

Capt. J. R. DeLamar, of New York City, is one of the largest owners and workers of Gold Mines in the world. After the most careful investigation he purchased in August, 1895, two Griffin Mills, and his report is so remarkable as to demand the careful attention of every one interested in Gold Mining.

We give it in his own words.

NEW YORK, Jan. 9, 1896.

BRADLEY PULVERIZER CO. *Gentlemen:*—The two Griffin Mills have been in operation now for 90 days on the hardest rock, with the exception of corundum, that I have ever met during my mining life. They have taken the rock direct from the breaker and they average about 30 tons to each machine, 40 mesh fine, without elevating or boiling. We simply put a ¼ mesh screen around the Griffin Mill, and the stuff comes out 40 mesh fine or over, which makes it an excellent pulp for leaching by cyanide or chlorination; therefore we have concluded to order **10 more Griffin Mills.** We have tried high-speed rolls and dry stamps, and after looking into the Huntington Dry Pulverizer, the Narod Pulverizer, the Stedman Pulverizer, the Frisbie Loop, the Cook, and various other dry pulverizers, unhesitatingly recommend your Griffin Mill to any one.

Yours truly, (Signed) J. R. DeLAMAR.

HOW 10 GRIFFIN MILLS WORK.

DeLAMAR'S NEVADA GOLD MINING CO.,
SALT LAKE CITY, UTAH, Nov. 24, 1896.

BRADLEY PULVERIZER CO. *Gentlemen:*—In answer to your inquiry as to what the "Griffin Mill" is doing at our DeLamar Mill, DeLamar, Nevada, we beg to state that we often run 310 tons per day with 10 of your mills in operation, and on one occasion these 10 mills produced 408 tons in one day. I have no hesitancy in stating that they will regularly produce at least 30 tons per day each on our ore, which is extremely and unusually hard.

Yours very truly, H. A. COHEN, *General Manager.*

These strong letters coming from such representative men are conclusive evidence that we are right in claiming that the "Griffin Mill" will produce a larger amount of finer pulp at less cost than any other stamp or pulverizer made.

Let us send you a free copy of our illustrated pamphlet, which will tell you all about the Mill and bring to you other evidence of its great achievements.

BRADLEY PULVERIZER CO., 92 State St., Boston, Mass.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S.F.**

Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $26.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING FEBRUARY 2, 1897.

576,422.—STEAM SCRAPER—J. Austin, S. F.
576,086.—MUSIC TURNER—J. F. Blasauf, S. F.
576,427.—TYPE-WRITING MACHINE—J. Bonner, Tiburon, Cal.
576,515.—TIMBER RAFT—A. J. Burcham, Woodland, Cal.
576,536.—SASH LOCK—Carson & Paterson, S. F.
576,090.—ROTARY ENGINE—R. S. Case, Pasadena, Cal.
576,260.—BUILDING BLOCK—E. G. Durant, Pasadena, Cal.
576,109.—WRENCH—W. G. Gilmour, Oakland, Ogn.
576,315.—STOVE AND CANE—C. V. Gordon, Los Angeles, Cal.
576,308.—BREAD CUTTER—J. Habrle, S. F.
576,118.—EXTRACTING GOLD, ETC.—W. F. Heathman, Santa Ana, Cal.
576,315.—SHADING PEN—A. O. Horton, Bridge, Ogn.
576,120.—CAN-MAKING MACHINE—R. D. Hume, Gold Beach, Ogn.
576,121.—CAN-MAKING MACHINE—R. D. Hume, Gold Beach, Ogn.
576,122.—CAN-MAKING MACHINE—R. D. Hume, Gold Beach, Ogn.
576,123.—CAN-HEADING MACHINE—R. D. Hume, Gold Beach, Ogn.
576,124.—CUTTING MACHINE—R. D. Hume, Gold Beach, Ogn.
576,125.—CAN-HEADING MACHINE—R. D. Hume, Gold Beach, Ogn.
576,195.—SEPARATOR—R. W. Jessup, S. F.
576,129.—ADVERTISING DEVICE—L. Julig, S. F.
576,132.—CURRENT WHEEL—A. Kruse, S. F.
576,272.—HYDROCARBON BURNER—J. E. Larson, Los Angeles, Cal.
576,138.—LEMON SQUEEZER—F. R. Miner, Los Angeles, Cal.
576,231.—STEERING GEAR—F. E. Schofield, Everett Wash.
576,283.—CAR FENDER—I. O. Stephens, Oakland, Cal.
576,170.—MANUFACTURING GAS—J. L. Stewart, S. F.
576,491.—CAR FENDER—E. West, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAR FENDER.—Ira O. Stephens, Oakland, Cal., assignor of one-half interest to Charles L. Clough, San Francisco, Cal. No. 576,283. Dated Feb. 2, 1897. This invention relates to that class of car fenders in which an independently acting spring or yielding bars are employed. It consists essentially of independent curved-spring yielding bars, projecting outwardly from the front of the car, to which the upper ends are attached, having rear extensions underlying them and adapted to move lineally, with stops to limit the amount of movement. These underlying bars have shoes fixed to their forward ends to form a riding surface when the device is depressed to form contact with the roadway.

BREAD CUTTER.—Jules Habrie, San Francisco, Cal. No. 576,308. Dated Feb. 2, 1897. This invention relates to a device which is especially adapted for cutting bread and other substances into slices. It consists essentially of a trough or guide to receive the bread, a shaft journaled longitudinally above the trough, a cam-shaped cutting blade fixed to the shaft, transverse guides secured at opposite ends to the frame and spanning the trough and between which the blade is movable, a feed board projecting upwardly into the trough behind the loaf or article to be cut, having a rack fixed to it, a transverse shaft, a pinion on one end to engage the rack, a ratchet wheel fixed upon the opposite end of the shaft, a spring-actuated pawl engaging the ratchet wheel, a cam fixed on the main shaft and intermediate mechanism actuated by the cam, whereby the pawl is oscillated backward and forward to turn the ratchet wheel and thus advance the loaf or article to be cut by successive movements previous to each cut made by the knife. The knife is preferably in the shape of a cam, fixed to the longitudinal top shaft, and when moved downward it makes a drawing cut, which is very effective in cleanly slicing the bread or other article which is being cut. The cutter is so made that it ordinarily will not cut entirely through the loaf, but will just leave the lower crust connected at one point, so that the slices remain attached together; but if it is desired to cut entirely through, a false bottom can be placed in the trough, having a transverse channel into which the knife enters, and the cut will then be complete.

SEPARATOR.—Robert W. Jessup, Los Angeles, Cal., assignor of one-half interest to Fairfax H. Whelan, San Francisco, Cal. No. 576,195. Dated Feb. 2, 1897. This invention relates to that class of separators employing screens arranged in series in a passage provided with directing and stop plates whereby the material is delivered to the successive screens and the particles are kept apart. It is particularly adapted to separation from wheat of oats, chess, sweet clover, mustard and other small kernels. It consists essentially in the combination of a screen composed of parallel-spaced needles, having a fixed connection at one end, and thence extending separate and independent to the other end, and free at said end, said needles being pliant and springy and adapted to vibrate under the contact of the material and its passage over them, an inclined directing plate in front of the screen to deliver the material to it and an inclined stop-plate behind the screen to keep apart the separated materials.

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 11, 1897.

With more settled weather business begins to improve, but no large movement of goods to interior points is looked for until the roads become passable. Jobbers are quite confident that a large increase in the volume of goods going out will set in soon, and continue to increase well into March and April. In manufacturing circles there is a confident feeling that when the new season business thoroughly opens there will be more orders than ever before. This is particularly the case with manufacturers of mining machinery, structural material, etc. The tariff question seems to be losing its unfavorable influence with receipt of semi-official information regarding its general character. It is stated that the new bill will be more conservatively drawn than many party leaders thought possible. This of itself is calculated to allay mistrust and create the impression that for the next four years, at least, there will not be any more tinkering with the tariff. Had a radical, high-protection bill been decided on it is quite certain that before two years changes would have to be made, owing to this country's progress in manufactures and other industries.

The prospects of a bountiful crop of wheat and a very large increase in the surplus available for export are having an unfavorable effect on prices for forward shipments of coal, iron, etc., imported from Europe; also for coal shipments from Australia after May next. It is argued that the big crop will draw ships to us which will bring inward cargoes at low freights so as to get outward cargoes at fair to good prices.

In the local money market there is nothing new to report. In the absence of free shipments of products to the East and a continued good demand for New York exchange, the premium for Eastern exchange holds strong. There is very little inquiry for funds, and no improvement in the demand is looked for until after the first week of March. It is quite freely asserted that there will be more activity in the market than for several years, provided nothing occurs to disturb the growing feeling of confidence. The Eastern money markets continue to work on easy lines, with the available surplus in funds not showing any signs of decreasing. London sterlings at New York has firmed up for long bills, owing to a continued growing ease in the London markets. Discounts have dropped there to a rate of 1⅝ per cent per year for call loans. At New York last loans reported were at the rate of 1½ per cent a year for call loans.

New York Silver Prices.

NEW YORK, Feb. 11.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29¾	64¾
Saturday	29¾	64¾
Monday	29¾	64¾
Tuesday	29¾	64¾
Wednesday	29 11-16	64⅝
Thursday	29 11-16	64⅝

	Copper.	Lead.	Iron.	Tin.
Friday	12 00	3 20	11 00@13 00	13 45
Saturday	12 00	3 20	11 00@13 00	13 45
Monday	12 00	3 25	11 00@13 00	13 45
Tuesday	12 00	3 25	11 00@13 00	13 40
Wednesday	12 00	3 25	11 00@13 00	13 45

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	.22½c Prem
New York Telegraphic Transfer	.25c Prem
London Bankers' 60 days	$4.86¼
London Merchants	$4.85
London Sight Bankers	$4.88¼
Refined Silver, per oz., 1000 fine	64⅝
Mexican Dollars	51½@52

SILVER.—New York mail advices report that for the week ending February 6 1,200,000 ounces of silver bullion were exported. In our market the demand has been more quiet, as it has at the East. The easing off in the price does not cause any surprise, but before the spring months pass better prices are looked for.

Pixley & Abell report shipments of silver to India, China and the Straits as follows for the year to February 1, compared with the corresponding period of last year:

Year.	India.	China.	Straits.	Total.
1897	£253,000	£14,550	.....	£267,550
Corresponding period last year	234,498	12,400	55,200	302,098

It appears that quite large shipments of silver are made direct from Australia to the East without passing through London. Almost all the silver shipped by the Broken Hill Proprietary Company goes to the East, being reshipped at Colombo. Last year about 7,000,000 ounces was thus sent. In addition to this, the shipments from San Francisco to the East direct last year were something like 8,000,000 ounces.

MEXICAN DOLLARS.—The market is quiet but steady. The China demand will commence again after the current week.

ANTIMONY.—Our market is quoted at 7¼@8c in a jobbing way. New York mail advices quote 7¼c for Cookson's, 6½@6¾c for Hallett's and 6¾c for Japanese.

COPPER.—The market is very strong with a further advance looked for. New York advices report a strong upward tendency.

Under date of the 3rd inst., D. Houston & Co., 22 Platt street, New York, say: During the past month a very large business has been done in Lake and Electrolytic, and consumers have shown great interest in the market. The Calumet & Hecla have sold freely at different stages of the market at prices varying from 11½@11⅞ consecutively. Although these transactions have not been in the nature of a "pool" sale, the amount disposed of by this company will aggregate about 10,000,000 pounds. In addition thereto, the Calumet & Hecla has sold largely for export to the continent. The course of the market has fully justified our conviction stated in our last circular that copper would sell at 12 cents before the present issue. Sales have been made repeatedly at 12 cents the past month by different producers, and the quantity placed at these figures has been considerable. That the market rests on a substantial foundation is indisputable, and we incline to the belief that the price of copper is likely to reach a higher level still. Large orders have been placed with manufacturers for copper wire for electrical purposes, against which heavy purchases of copper have been made. The season for activity in electrical improvements is close at hand, and new work in connection with trolley roads, telephone lines and electric lighting is going to create a decided demand for copper to furnish the wire necessary to complete these projected schemes throughout this country and Europe.

The local market is quoted as follows:

Ingot, jobbing	14½@—
Ingot, wholesale	—@13½
Sheet copper	—@17
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c

QUICKSILVER.—The market is firm at $37.50 from the syndicate, but there are few outside lots, aggregating about 100 to 200 flasks, that can be had at a slight concession. New York is quoted firm, with outside lots getting scarcer. These sell at 51 to 52 cents, while the syndicate hold at 53 to 54 cents. London is stronger with outside lots cleaning up and the market advancing to Rothschild's recent advance of 5s.

The market is quoted as follows:

Domestic trade, per flask	37 50

For export, quotations are nominal but less than for home.

BORAX.—There is nothing new to report in our market.

The market is quoted as follows:

Refined, in car lots	5
Refined, in sacks	4¾
Powdered, in car lots	4½
Concentrated, "	5

LEAD.—A further advance has taken place with the markets at home and abroad closing strong, with the tendency to still better figures.

Our market is quoted in jobbing lots as follows:

Pig	3 75	@	3 85
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a stronger tone to the market.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The general situation is unchanged. Pig seems to be strengthening, but plates are very irregular.

We quote as follows:

Pig, per lb	14½c@	—
Plate, I C coke, heavy, per box	$4 05@	—
" " light, "	3 95@	—

IRON—The market is reported essentially unchanged. There is quite a stock of foreign pig here with good shipments on the way. At the East the markets are decidedly mixed with the outlook rather uncertain. A leading New York exchange reporting on the situation says: "A gentleman who has large interests in the iron and steel industry tells us that the wholesale breaking up of pools in that industry will not prove to be permanent. His opinion is that these various associations have been dissolved simply to let the situation adjust itself pending the settlement of tariff questions and other matters. It does not seem likely that any change will be made in the tariff as far as manufacturers of steel are concerned, but it is obvious that the absence of combinations and an apparently free-for-all condition of things is better while the tariff is under consideration than would be the spectacle of half a dozen or a dozen pools scattered all through the trade. As regards the ore question, he believes that before very long another ore pool will be formed, but there is no hurry in forming it as navigation will not open for some weeks.

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—The general situation is practically unchanged. The demand and offerings seem to be fairly equal. The future of the market will depend largely on the wheat crop outturn. Present advices indicate a very large surplus.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00

Mining Share Market.

SAN FRANCISCO, Feb. 11, 1897.

The market has hung around $2.05 for Con. Virginia, while the balance of the list slowly settled. There are enough bull points out of a coming deal to promote much higher prices, but the market acts in such a way as not to create confidence with conservative operators that the points are correct, at least for a near-by move of much moment. At present attention is drawn to Con. Virginia, and the prospects are largely exaggerated, but what they may result in it is hard to say. The writer will venture the opinion that not much if any wider vein will be found than is now being worked, unless work should be pushed further west. When the present showing is developed it is not at all likely but the ore will nearly pay expenses. It is beginning to be discussed who is superintendent of Con. Virginia. Some say Lyman and others say a writer on an afternoon paper. At any rate, the latter is getting considerable credit; so he did when the famous, but ill-fated financially, Jim Rule drift was run. A rumor is current that a combination has been formed to drain the American Flat mines, lying to the south of Overman. It is stated that D. O. Mills and Francis Newland have lent their names to the undertaking. That these mines will be drained is not doubted, for they are rich in minera', but how soon is an open question. The writer will place himself on record as asserting that the Comstock mines will be pumped out and work carried on below the water level. He will also assert that the west lode will be shown up and dividends paid by some of its companies. He will also affirm that the millions of tons of low-grade ore on the Comstock lode will be extracted and milled at a good profit. He will also assert that the Comstock Tunnel will be extended west, and both its north and south lateral tunnels be extended still further, besides which lateral tunnels will be run to develop the Brunswick and one or two more lodes. How soon the above work will be started, and whether as a whole or by sections, the writer will not hazard an opinion; but in the course of time it will all be done, and it will cost big money, which must come out of shareholders.

From the Comstock mines the official letters are as barren of news as a skeleton is of flesh, and they are equally as fascinating for assessment-wracked shareholders to feast their eyes upon. When there will be a change for the better it is hard to say; but with so much active exploiting work going on from one end of the lode to the other, there is apt, but not at all likely until insiders have about all the shares, to be important strikes which would lend new interest to official advices. In Alta they appeared to have dodged the Keystone vein, but have not been so successful in dodging an assessment. In Caledonia they are working on the 1100-foot level. No change of work in Overman. They continue to kill time and spend money. From Seg. Belcher and Belcher the old stereotyped letters come to hand. They do not give any particulars regarding work or how much rich ore they are developing. Crown Point's letters are more satisfactory, so far as concerns the work, but is unsatisfactory so far as concerns ore strikes or prospective strikes. Work is unchanged. In Yellow Jacket and Confidence no change is reported in the work. The latter is still taking out a few tons of ore each week while working to avoid developing the west lode. No work is reported by Challenge. The long joint west crossdrift that is being run by Confidence, Challenge and Con. Imperial is again in hard material. From Alpha and Bullion no change comes to hand. In Potosi they are still fooling around on the upper levels. No work is being done by Chollar. In Hale & Norcross they are working on the 700, 800 and 900 foot levels. Between the two former they have been repairing the shaft, and from the latter they are upraising. From Savage, Gould & Curry and Best & Belcher nothing new has come to hand. The center of attraction is at present the upraise in Con. Virginia from the 1650-foot level and the work on the twenty-sixth floor of the 1750-foot level. It looks very much as if it will result in rainbow chasing. The 1000-foot level bears closer watching than the other two levels, but it will take time yet. In Ophir they are still exploiting the central tunnel and 1000-foot levels. They appear careful not to find anything of much value. The usual prospecting work is being done by Mexican on the 1000-foot level, Union on the 900-foot level and Sierra Nevada in the Layton tunnel.

From the Brunswick lode nothing of an exciting character comes to hand. Occidental has levied another assessment, so as to provide the "sinews of war" to prosecute work on the levels reported last week. Chollar extracted, raised and milled 72 tons of ore last week. Work is being done below the 200-foot level, where they were in a 3-foot vein assaying over $45 a ton. They are working above and below the 300-foot level. On the 400-foot level they are upraising and also driving the south drift ahead. On the 550-foot level they

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

Books Received.

Getting Gold: a Gold-Mining Handbook for Practical Men: By J. C. F. Johnson, F.G.S., A.I.M.E. This is a practical book, that will be found of value to practical men engaged in mining as investors, mine owners or prospectors. A great deal of information is given in a small space. To those especially who have not access to larger works on the special subjects, it will be found of use for reference as to the methods of mining in its different branches. Published by Charles Griffin & Co., Limited, London, and J. B. Lippincott Company, Philadelphia. Price, $1.50.

DELINQUENT SALE NOTICE.

HARTMANN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Chili Gulch District, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 22nd day of December, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
C. E. Stephens	2	3,000	150 00
H. Otterson	6	2,500	125 00
J. P. G. Harrell	10	2,000	100 00
C. B. Schonfeld	14	2,000	100 00
C. C. Shepardson	9	3,390	169 50

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of December, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 46, No. 4 Montgomery street, San Francisco, California, on TUESDAY, the 23d day of February, 1897, at the hour of 5:30 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

G. W. PEEK, Secretary.

Office—Room 46, No. 4 Montgomery street, San Francisco, California.

FOR SALE---CHANNEL GRAVEL PROPERTY.

One Hundred and Two Acres at Reasonable Figures.

No cement. Permit to hydraulic assured. Expense for impounding debris comparatively small. Cheap water. Reasonable time for prospecting. Will negotiate with principals only, or authorized agents. Cash proposition. Address GRAVEL MINE, P. O. Box 66, Placerville, Cal.

WANTED.

A young man, bookkeeper, competent to take charge of a general merchandise store, seeks engagement with a mining company, or would like to hear of some mining camp where he could open a store for own account.

Address A. H., this office.

WANTED—A POSITION

By a practical mining engineer as superintendent of a gold or silver and lead mine. Twenty years' experience in mining, milling and concentrating gold, silver and lead ores in California, Nevada, Utah, Idaho, Montana and Colorado. Highest recommends from leading mining companies in above States. Would like to sign a contract for two or more years to go to Mexico or South America. Address "Practical Engineer," Box 21, Mining and Scientific Press office, San Francisco, Cal.

HYDRAULIC MINER.—A practical hydraulic miner of 20 years' experience now open for engagement. Experience as superintendent and foreman in California and British Columbia. Understands ditch surveying and fitting up mines. Address HYDRAULIC MINER, care this office.

WANTED.—Foreman to run a copper blast furnace, oxidized ores, in West Australia. Salary $175. Expenses out paid. One year engagement. Address ALFRED ROPP, Selby Smelting Works, Selby, Cal.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of January, 1897, an assessment (No. 5) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 8th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—237 12th street, San Francisco, California. Office hours from 4 to 6 o'clock P. M.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 13th day of January, 1897, an assessment (No. 5) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of February, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of November, 1896, an assessment (No. 9), of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of Janugry, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors of the Jamison Mining Company, held on the 25th day of January, 1897, it was resolved that any stock upon which the assessment shall remain unpaid on the 24th day of February, 1897, be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 21st day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of January, 1897, an assessment (No. 61) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of March, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 23d day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room No. 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1897, an assessment (No. 48) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 31st day of March, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20 and 22, Nevada block, 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of February, 1897, an assessment (No. 26) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the 6th day of April, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED R. BURROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

MINING SCIENTIFIC PRESS

INDISPENSABLE TO MINING MEN.

THREE DOLLARS PER YEAR, POSTPAID.

SAMPLE COPIES FREE.

MINING AND SCIENTIFIC PRESS,
220 MARKET ST., SAN FRANCISCO, CAL.

The New York Herald in its issue of January 3, 1897, devoted nearly a whole page to a notice of the under-mentioned work which it described as being "A Remarkable Scientific Memorial." It also stated that "Nothing more revolutionary than Dr. Emmens' memorial has been advanced in the name of science since the day when Sir Isaac Newton presented to the Royal Society his doctrine of universal gravitation."

The Argentaurum Papers,

No. 1.

Some Remarks Concerning Gravitation,

By STEPHEN H. EMMENS.

CONTENTS.—Foreword; The Newtonian Doctrine; The Defect of Newton's Proof respecting the Centre of Force of a Spherical Shell; The Newtonian Demonstration respecting the Attraction exerted by Spheres upon External Bodies; An Inquiry as to the Reason of the Defect in the Newtonian Doctrine of Attracting Spheres having remained undiscovered until now; The Newtonian Doctrine of Internal Attractions; The Doctrine of Gravitating Centres as distinguished from Centres of Gravity; The Calculus of Gravitating Centres; The Gravitating Centre of a solid, homogeneous Sphere with relation to external bodies; The case of a Spheroid; The Precession of the Equinoxes; The Density of the Earth; The Internal Attractive Force of a Spherical Shell; The Internal Attractive Force of a Solid Sphere; The status of a Solid Sphere with regard to Internal Pressure; The Centrifugal Theory of Cosmical Bodies; The Variation of Density as regards the Earth's Crust; The Significance of Earthquakes; The Temperature of the Earth; The Source of Terrestrial Heat; The Source of Solar Heat; Saturn and Jupiter; The Volcanic Character and Quiescent Status of the Moon; The Obliquity of the Ecliptic; Elevation, Subsidence and Glacial Epochs; The Cooling and Shrinking of the Earth's Crust; The Arch Theory of the Earth's Crust; The cause of Ocean-beds and Mountains; Terrestrial Magnetism and Electricity; The Presence of Gold in the Ocean; The Verification of the Centrifugal Theory; Universal Gravitation; E pur si muove; The Error of the Dyne; The Variation of Products; The Infinite Concomitant of Newtonian Particles; The self-lifting Power of the Newtonian Particles; How two equally-heavy Newtonian Particles, taken together, weigh less than the sum of their separate Weights; The self-contradictory character of the Newtonian Law; The Superior limits of Newtonian Gravitation; The Correlation of Space and Energy; The outline of a system of Universal Physics. Conclusion.—Envoy.

The above-mentioned work is published by the Plain Citizen Publishing Company, 1 Broadway, New York City, N. Y., U. S. A.

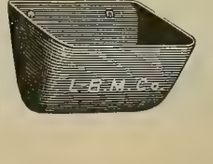
Price, cloth bound, $2.00 post-free to any address.

Assaying Gold
.....AND.....
Silver Ores.
A Standard Work.

THIRD EDITION JUST OUT.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.



The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 220 Market St., San Francisco.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

New Mexican Gold Fields.

In the present universal quest for gold, the traditions of ancient mining ground are remembered and every prehistoric point is exploited anew. Our California gold mines go back through fifty years, but we write herewith of a region that yielded gold to the crude efforts of aboriginal miners before the first voyage of Columbus. Reference is made to the gold fields of New Mexico. There is extant a document dated prior to the uprising of 1680, signed by the commandante at Santa Fe, asking the Mexican Vice-royal for an armed force to guard the transportation of a shipment of gold dust valued at over $2,000,000, from a place some miles north of Santa Fe to the Mexican capital. Ancient workings show that centuries before the date mentioned gold was produced from that region in enormous quantities. Many who have given the subject some attention say that the La Belle district, Taos Co., New Mexico, is the oldest mining community in the United States. Ancient evidences of mining indicate principally placer work, but quartz ledges are receiving the most present attention. Abundance of wood and water and a genial climate make work easier for the prospector and miner, and quite recently one of Colorado's leading railways has made that entire country very easy of access. The railroads of Colorado are a big factor in the development of that State. Unlike our California roads, they reach into every little camp, make the most favorable rates as an inducement to business, and superbly advertise the mineral resources of the State. Like the Mormons in Utah, long ago, our California railroad people seem afraid that the world will find out the surpassing mineral wealth of the Golden State and sedulously refrain from mention of mines in their meager publications. The Denver and Gulf Road, of which B. L. Winchell is Gen. Pass. Agt., has a line almost into the La Belle district, and runs from Trinidad in southeastern Colorado to Vasquez, N. M., a few miles north of La Belle. The accompanying views are from the company's most recent brochure, entitled "La Belle Gold Fields, and Trinidad the Gateway."

THE DENMARK MINE, LA BELLE, NEW MEXICO.

THE CLIMAX MINE, LA BELLE, NEW MEXICO.

Since the settlement of the Maxwell land grant difficulty there is an influx of prospectors. The ore is hematitic, changing to sulphides as depth is reached. The breast of a 500-foot tunnel in the Denmark is in $17 ore; the Climax shows a 14-foot vein of $9 ore. The free gold will be treated at La Belle; the concentrates and base ore will be shipped to Trinidad, the natural gateway to that part of New Mexico, a young city where water, coal, iron ore and railroad connection justify its claim to being the metropolis of southern Colorado.

Imports and Exports of Gold and Silver.

The U. S. Bureau of Statistics reports some interesting figures as to the exports and imports of gold and silver for 1895 and 1896. In 1895 there was imported of gold $1,310,448 and exported $15,481,347, while in 1896 the imports exceeded the exports, the former being $2,567,115 and the latter $405,856. As to silver there has been little relative change during the two years under review. The exports in 1895 were $5,159,537 against imports of $883,489. In 1896 the exports were $6,819,545 against imports of $1,279,801.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Denmark Mine, La Belle, New Mexico; The Climax Mine, La Belle, New Mexico, 149. Improved Engine Lathe, 156.

EDITORIAL.—New Mexican Gold Fields; Imports and Exports of Gold and Silver, 149. Mine Inspectors; The Mine Jumper's Paradise; The Age of the Gold-Bearing Gravels of the Sierras; An Opening for California Building Stones, 150.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 154–5.

SCIENTIFIC PROGRESS.—Refractory Clays; Philosophy of Color in Light; Candle Power; A New Source of Power; The Planet Jupiter; A Renovated Coach, 156.

MECHANICAL PROGRESS.—Improved Engine Lathe; Reduction in Cost of Manufacturing, 156.

ELECTRICAL PROGRESS.—Electrification of Air by Roentgen Rays, 156. Electric Ship Lighting, 157.

PRACTICAL INFORMATION.—The Russian Oil Export in 1896; Cost of a Piece of Track; A Concurrent Resolution; Great Iron Manufacturing Plant in France; To Establish an Iron Foundry in Chili; Elements Entering into the Cornstalk, 157.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 166.

MISCELLANEOUS.—Concentrates, 151. Outline of the Geology of California with Reference to Its Mineral Deposits; Rapid-Drop Stamps, 152. The West Kootenay Mines; Ore Atomic Process; How to Thaw Powder; National Miners' Bureau of Information, 153. Coast Industrial Notes; Book Notices; Commercial Paragraphs; Recent California Mining Incorporations; Personal; Recently Declared Mining Dividends, 159.

An Opening for California Building Stones.

The authorities of the State University of California are taking a step that will be of practical value to those interested in building stones and will do much to show the value of the resources in that direction.

It is entirely probable that for many years to come the authorities of the State University will be concerned with the erection of new buildings. That these new structures will be on a scale befitting the dignity of the institution and of the State of California is assured by the call for competitive plans which has been issued by the Board of Regents to architects the world over. This competition has been rendered immediately possible by the enlightened generosity of Mrs. Phœbe Hearst, who a few months ago gave $15,000 to advance the project and thus secure designs from the most eminent architects of our time.

In the construction of the new buildings, stone will be largely used; and in view of the fact that so little is yet known of the possibilities of the building stones of California, the Department of Geology of the University has been requested, so far as the means at its command will permit, to make a collection of the building stones of the State so that they may be available for examination and choice in determining the stones to be used in construction. Prof. Lawson has begun this work of assembling the building stones of the State at Berkeley and invites the co-operation of quarrymen in making the collection as complete and representative as possible. From quarries or outcrops where quarries are possible, and where the stone is fairly uniform, it is desired to secure two blocks of stone—one a twelve-inch cube dressed differently on different faces to show the qualities of the stone and a four-inch cube similarly dressed for the museum shelves and showcases. In cases where the rock has ornamental qualities and varies in texture and color, as in the marble quarries, several such blocks would be required to represent fairly the stone. In cases where, owing to special structures, the stone appears to better advantage as slabs or columns, these are also desired. These samples properly cut by skilled masons may be sent by freight to the geological museum of the University at Berkeley, where they will be made part of the permanent economic exhibit as soon as the necessary accommodations are provided for the museum. In cases where there are ledges of promising rock, upon which no quarrying has been done, and advice is desired as to the most advantageous opening to be made, it is possible that arrangements may be made whereby Prof. Lawson may visit the ground and advise as to the character of rock, extent, structural features, etc.

Mine Inspectors.

There has been introduced in the California Legislature by Prisk in the Senate and Robinson in the Assembly a bill to provide for the appointment by the Governor of a Mining Inspector, who shall be a practical underground miner, in each Congressional district in the State. The duties of these inspectors are defined as follows:

It shall be the duty of such inspector to examine the underground works of every operated mine, so as to ascertain its safety; to inspect its machinery, modes of ventilation, ladders, roads, supports and modes of exit, and, in case he believes that any of the same is insufficient, or dangerous, to notify the superintendent of such mine, or the owners thereof, and in case such notice remains unheeded by said superintendent or owner, such owner or person employing labor therein shall be liable to his employes and their legal representatives for any accident or injury caused or promoted by the failure to attend to such notice, and the fact that the danger was known to such employes shall be no defense against such liability.

It would seem that, in order to make the work of the inspectors of real value, some provision should be made to force the mine superintendents or owners to remedy the defects when pointed out.

The statute providing that there shall be in each mine two means of egress has been ignored in many cases. In respect to enforcing this law, the proposed mine inspectors should be able to do good work, even under the bill as drawn. It may be said that in a large majority of the mines of the West the superintendents and owners exercise a careful watch for the safety and comfort of their miners. Not only are all reasonable precautions taken against accidents, but the mines are ventilated as well as the circumstances will permit. Self-interest should induce all to do this, but unfortunately there is a small proportion of miner owners for whom stringent laws are necessary, and it is toward such that the proposed bill is directed.

It is probably best that in the proposed bill large powers are not given the inspectors at first. The measure is to an extent an experiment, and a trial will show in what direction there should be changes made by future legislatures.

The Mine Jumper's Paradise.

A correspondent writing from Kern county, California, says that, owning a mining claim the title to which seemed shaky through careless recording, he had it relocated in the name of the new owners January 1, 1896, the notice reading "beginning at this initial monument situated at the shaft of the ——— mine, and well known as the old shaft on the so-called ——— mine and running due east, etc." The exact point of compass was noted for future survey. At the beginning of this year the mine was jumped and taken possession of on the grounds that the assessment work had not been done in 1896—the year of location—and that proper monuments were not put up marking the claim. Those who jumped the property did not claim that the assessment work should have been done under the old title, but under that of the location of January 1, 1896, and, of course, that objection need not be considered here. But as to their other contention that proper monuments had not been put up to mark the boundaries of the claim—is there any one miner familiar with the methods of locating mining claims, or mining lawyer, who can tell what would be the result of a suit brought in the premises?

The MINING AND SCIENTIFIC PRESS is often asked what shall constitute a proper marking of a mining claim on location, and can only say that, to be on the safe side, it is best to put a monument on every corner and two or more on the vein. Until the State Legislature of California shall prescribe what shall constitute a proper marking, there will be confusion. It was hoped that the mining members of the present Legislature would take some steps toward securing the passage of a bill making this provision.

Unless there are adopted good laws on this subject, the troubles caused by jumpers and blackmailers who locate around new discoveries, cutting off rights of way, will increase largely in the near future with the increased activity and interest in mining, and California will become the mine jumper's paradise.

The Age of the Gold-Bearing Gravels of the Sierras.

Owing to the romance connected with the auriferous gravels lying along the western slope of the Sierra Nevada mountains and the importance they have been to the State, the country and to the world through their great yields of gold, there has been devoted to them more attention by geologists than probably their value, from a scientific point of view, would have warranted. More "theories," probably, have been promulgated by prospectors, miners, dabblers in geology and others in reference to these deposits than as to any others in the world. Of these, the old "blue lead" theory—the idea that there was an ancient channel running along the Sierras north and south, across which the present rivers have cut—has been one of the most popular. Geologists have shown that the old streams, in a general way, followed the directions of the present streams. Owing to discovery of supposed vertebrate remains, many have considered the deposits of much more recent formation than they really are.

In a recent article in the *Journal of Geology*, Mr. Waldemar Lindgren of the United States Geological Survey gives an excellent summary of the evidences gained during his extended work on the gold belt, which bear upon the age and history of the auriferous gravels. They have been found not to belong to one continuous period of deposition, but to several, and it has been his object to discriminate those of each period and determine their age. All students on this subject from Whitney down have been obliged to work at a disadvantage in having very few organic remains besides plants to guide them.

He shows that during the later Cretaceous and early Tertiary erosion was actively going on. The earliest and deepest gravels date from the close of the Eocene or the beginning of the Miocene.

During the Miocene broad valleys were excavated, and toward its close, during the deposition of the Ione formation, the great mass of the auriferous gravels were formed.

The extensive eruptions of volcanic material are supposed to close the gravel period. In Mr. Lindgren's classification the Pliocene is considerably contracted, and it is supposed to have closed with the last of the flows of Andesitic lava. The filling period, the Pleistocene, leading down to the present time, was one of active erosion, resulting in the deep canyons dissecting the ancient auriferous channels.

Lindgren differs from Whitney in making the main body of the auriferous growth of Miocene, rather than Pliocene, age; but this comes partly from the fact that he has included within the Miocene deposits which some geologists are more inclined to consider belong in the Pliocene. The determination of that point has, however, a greater technical than practical interest.

This work in the gold belt is certainly beset with great difficulties, and it may be some time before all differences are settled.

According to Lindgren, the history of the Sierra Nevadas has been in general as follows:

1. In early Cretaceous the Sierra block separated by a fault line from the great basin area.
2. Through the Cretaceous and Eocene continued degradation.
3. Slight depression in Eocene or lower Miocene, with the formation of the oldest and deepest auriferous gravels.
4. In later Miocene rhyolitic eruption and continued accumulation of gravels (main gravel period).
5. Andesitic eruptions and elevation of the range.
6. Rapid erosion, followed by basaltic eruptions, cutting deep canyons and glaciation.

A BILL has been introduced in the California Assembly by Mr. Caminetti and favorably reported upon by the Committee on Mines and Mining interests, providing for liens of miners and others upon mining claims. The act deals only with liens against mining claims, and it is so framed as to overcome the difficulties miners now find in making liens lie against many kinds of mining property, such as those held under agricultural patents or under a Mexican grant. The bill also specifies against what kind of work liens may lie. At present Supreme Court rulings preclude the miner from most of the advantages of the lien law.

Concentrates.

THE San Francisco Gold Mining Exchange has closed.

IT is proposed to organize a mining exchange at Baker City, Oregon.

A BANK is to be started in Johannesburg and one in Randsburg, in Kern county, Cal.

A 15-STAMP mill is to be erected on the Rappahannock mine at Sonora, Tuolumne county, Cal.

THE 40-stamp mill put up for the Gwin mine, Calaveras county, Cal., last fall cost $21,000.

THE immediate erection of a matting plant for the sulphide ores of Bingham, Utah, is promised.

AT Waldo, in Southern Oregon, a large vein of copper has been uncovered by hydraulic mining.

ON February 1st the wages of the DeLamar, Idaho, miners were reduced from $3.50 to $3 per day.

DURING the past two weeks over $2,000,000 in gold has been received in New York from San Francisco.

THE amount of timber used in Butte, Montana, copper mines is estimated at over 36,000,000 feet for 1895.

A COMPANY has been incorporated in Salt Lake to work the Russell mica claims in Latah county, Idaho.

ON the Vermilion river, in northwestern Colorado, rich copper and gold deposits have been discovered.

THE Nevada Silica Company shipped from Carson last week a carload of silica to Philadelphia as an experiment.

THE shipments of ore from nine mines at Rossland during the first six weeks of this year amounted to 5085 tons.

JAMES F. WARDNER has obtained a bond on the Monitor at Rossland, B. C., for a Montreal syndicate for about $200,000.

F. AUG. HEINZE, formerly of Montana, who owns smelters in British Columbia, is advocating an export duty on galena ore.

THE Congress mine, Arizona, has 400 men on its pay-roll and there is talk of eighty stamps being added to the 40-stamp mill.

THE prospect of having a railroad built into Deep Creek district, in Utah, this summer has caused considerable renewed activity.

THE exact figures of the output of copper from the Anaconda properties in Montana for '96 are 125,350,693 pounds, against 90,775,294 for 1895.

ALL men have their uses. Senator Stewart of Nevada threatens to "talk the Loud postal bill to death" in the Senate. He can do it.

GEO. D. BURTON is still organizing "electric smelting companies." The most recent is in Portland, Me., "capital stock $1,000,000;" paid up, $60.

ARRANGEMENTS are being made for the erection of a cyanide plant at the Eureka mill on the Carson river, Nevada, mainly for the working Chollar tailings.

UP to February 6th the value of the ore, bullion and matte shipped from the port of Nelson, British Columbia, from the mines of southern Kootenay, was $953,441.

THE promoters of the proposed Twin Lakes Railroad, from Leadville, Colo., to handle the ores of that district, announce that work will be commenced in March.

AT Vancouver, B. C., men are boring for coal; opposite, in North Vancouver, prospectors are at work on gold quartz claims which so far have been but slightly developed.

A PROSPECTOR near Great Falls, Montana, claims to have discovered a soap mine. It consists, he says, of alkali, concentrated, and is strong enough to take the hair off a dog.

A TELEGRAM from Santa Barbara, Cal., states that a gold mine has been found in Smith's canyon, and that a number of prospectors have gone into the hills of the neighborhood.

THE Chainman group of mines in Robinson district, near Ely, Nevada, has been sold to Charles Love and his associates for $125,000. These mines have in the past produced $850,000.

A GROUP of eight claims at Gold Mountain, Piute county, Utah, developed by Miller & Jones, has been sold to W. I. Higgins of Montana for $90,000. A mill will be put up in the summer.

THE Helvetia gold mine, Julian district, San Diego county, Cal., is reported bonded for $40,000 to Denver capitalists. A 1200-foot tunnel is being driven to tap a ledge 700 feet below the surface.

FROM the Peter Wood gravel mine on Magalia ridge, Butte county, Cal., a large section of a tree was taken recently. It was found at a vertical depth of 800 feet and from the face of the tunnel 1100 feet.

IN Kaslo, B. C., steps were recently taken toward forming an association of mine owners of the Nelson, Ainsworth and Slocan districts, and now a movement is on foot to form a similar organization at Rossland.

THE Geyser and Marion mining companies, in the Camp Floyd district, Utah, have settled their differences and joined forces in a new corporation, the Geyser-Marion Mining Company, with a capital stock of $1,500,000.

F. AUG. HEINZE wishes to make arrangements to erect refining works at Trail, B. C., to treat the matte product of his smelter, and to that end is advocating an adjustment of the tariff so as to put on an export duty.

SENATOR MITCHELL of Oregon, who defeated the California mineral land bill last May, has this week discovered that his constituency remember and revenge treachery, even to a sister commonwealth, he having failed of re-election.

NEGOTIATIONS are pending for the sale of the Almo-Cumberland Slocan mill and tramway and the Idaho mine in British Columbia to an English syndicate. The mills have earned $300,000 and the Idaho pays $20,000 a month in dividends.

THE State land department of Montana has received from the Secretary of the Interior a patent to 5459 acres of timber land located on the Missouri river and valued at over $10 per acre. The land belongs to the State Normal School grant.

MANAGER DWIGHT B. HUNTLEY of the De Lamar mine in Idaho reports for January: Tons crushed, 4043; bullion realized, $47,827; ore shipped, $1050; other revenue, $55; total, $48,932; cost and expenses, $42,638; estimated profit, $6294.

AT the John Dix mine, on the Magalia ridge, in Butte county, Cal., in order to trace the channel, a man is trying electric rods, which are supposed to point out the direction the channel follows. Electricity surely is a wonderful thing.

IN the second week in February there were shipped from the Rossland, B. C., mines 1209 tons of ore, of which 720 came from the Le Roi, 250 from the War Eagle, 90 from the Iron Mask, 65 from the Kootenay and Columbia, and 84 from the Josie.

THE reports that have gone abroad of the improvement in mining in the United States and British Columbia during the past year or two, and the depression in the industry in Africa, has caused many of the American miners who went there to return.

THEY are constructing a flume from the Standard Consolidated mill in Bodie, Cal., to the upper cyanide tank, a distance of 1500 feet, to convey tailings, which will be raised by an elevator to about the height of the mill and dumped into the boxes.

A TELEGRAM from Monterey, Mexico, announces the consolidation of the Carbonite, Trinidad and Aztec silver-lead mines and the sale of the controlling interest in the Consolidated Aztec Mining Company stock to a syndicate of local millionaires.

LAST Monday in Denver, Colorado, the Crosby-Ehrich Investment Syndicate made a final payment of $100,000 on the $300,000 they had agreed to pay for 300,000 shares in the Elkton Consolidated Mining Company. They are acting in behalf of French interests.

THE Freshwater mining district, Colorado, is attracting favorable attention. It is located twelve miles from Freshwater station, on the Colorado Midland Railway. Guffie is the name of the postoffice and new town. A mill of thirty-five stamps is about complete.

OVER 900 men are employed in the Slocan, B. C., mines. Americans in the Slocan are alarmed for fear the Legislature will pass a law prohibiting aliens from staking claims in Canada. It is said that the Canadians are inclined to retaliate against the alien labor law recently passed.

THE American consul at Matamoras, Mexico, writes to the State Department of asphalt deposits 300 miles from that city for working which he assisted in obtaining a concession for Americans under a lease for fifty years. A company is now being organized in the United States to commence work.

A BILL has been introduced in the Colorado Legislature which is aimed to prevent the similarity of the names of mining companies. There has grown up an evil in this respect where unscrupulous people mislead the public by giving to worthless properties names similar to those borne by rich mines.

LATELY J. A. Yerrington, at Carson, received several sheets of mica from the Czarina mine, situated in the St. Thomas mining district in Lincoln county, Nevada, from which shipments were made to Manchester, England, and pronounced of good quality. At the mine they are now cutting out sheets a few feet from the surface.

J. K. CLARK, one of the owners of the Mayflower mine in Madison county, Montana, says that a coal discovery on the south side of the Mayflower upsets all geological calculations. The vein was found imbedded in the lime formation and is of a medium fair grade. It is largely impregnated with iron and on assaying went $5 in gold to the ton.

THE Supreme Court of Montana has decided in favor of the shareholders against the directors in the Bannister Mining Company case. The directors had bought an adjoining claim for $45,000, which they transferred to the company for $110,000. The directors have been declared by the court guilty of a conspiracy and the sale was declared void.

THE Gold Creek, Nevada, Townsite Company, with a capital stock of $2,000,000; the Gold Creek, Nevada, Improvement Company, capital stock $100,000, and the Elko, Nevada, Mining Company, with a capital stock of $10,000,000, have incorporated in Colorado. The companies are formed to work the Gold Creek placers and handle the other properties connected.

THE Secretary of the Interior has ruled to the effect that where the book and page of the record of the location certificate has not been given in the published notice for the application of a patent to a mining claim, the application is defective and must be made over again, although the receiver's receipt has been issued. It is unlikely that such a decision will be upheld by the courts.

A CONTRACT has been let for the erection of a 100-ton cyanide and amalgamation mill at Bingham, Utah, on the Highland Boy property. The mill will be upon the plan generally adopted in the treatment of South African ores, first amalgamating and the tailings treated with cyanide. It is to be automatic throughout, the ore passing through the various processes without any handling at all.

IT is amusing to read the claim of Eastern "mining journals" that they are in daily receipt of inquiries from "heavy" investors, asking for advice as to how and where to make purchases of mining property. It is so likely that men with money to buy mining property content themselves solely with supplicating pointers from publishers of "sample copy" "mining journals" in Eastern cities.

THE stocks of copper in the world's market have been decreasing of late in spite of the large output, and with the continued increase of electrical work it is probable that, unless there shall be a large increase in the output, the prices will increase. The total visible supply of copper in the world on February 1 was 32,288 tons, against 34,930 tons the first of January, and 42,128 tons at the first of February, 1896.

ONE Benjamin Brazelle, a very distinguished scientist of St. Louis, Missouri, has discovered a key to all sorts of transmutations with the aid of electricity. He can not only transmute silver into gold, but gold into silver; but that he considers an insignificant part of his discoveries, for he can easily change clay into gold, silver, iron, calcium, aluminum, and some fifteen other metals not known to science.

MINING in the west of England is at a low ebb, and it is said that only one mine is now working at a profit. The mines of lead, antimony, iron, zinc and manganese, which formerly gave employment to some thousands of people, have practically ceased to exist, and the production of copper, once a very large industry, is now quite insignificant. Tin mining is still an important industry, but the quantity produced is dwindling year by year.

THE Congressional Committee now working on the tariff bill has decided to restore the McKinley duty on lead ores. The McKinley rate was 1⅛ cents per pound, the present duty is ¾ cent. It was also decided, instead of having imported lead ores assayed at the port of entry as now, to admit them under bond and have them assayed at the assaying office nearest their destination. Copper, brass, gold and silver were also restored to the rates of the McKinley law, which are 35 per cent ad valorem on copper, 1¼ cents per pound on brass and 30 per cent ad valorem on gold and silver.

ACCORDING to figures furnished by the Witwatersrand Chamber of Mines, Johannesburg, South Africa, the total number of ounces of gold produced by the mines of that district during 1896 was 2,281,374, as compared with 2,277,635 ounces in 1895, 2,024,159 in 1894 and 1,478,473 in 1893. The product for 1896 is 4239 ounces in excess of the preceding year's output and 57,715 ounces more than the Transvaal mines yielded in 1894.

THE gold yield of Ontario, Canada, for 1894 was $32,776; for 1895, $50,281, and for 1896, about $175,000. A number of large mills have been erected and the output is increasing. Of the minerals of economic value mined in Ontario there are salt, petroleum, natural gas, graphite, mica, asbestos, gypsum, apatite, gold, copper, nickel and iron. In 1896 the nickel from the ores and matte of Ontario refined in the United States amounted to 3,697,039 pounds.

THE bill throwing open to use and occupation the reservoir sites of the Western States has passed the House. Bowers explained that with the amendments the bill was favorable to the arid districts and was absolutely necessary to the development of arid lands. Without such legislation acts providing for reservoir sites were useless. There are twenty-three such sites in California, nineteen in New Mexico and as many in Arizona and Nevada.

THE Exploration Company of London, through Henry Bratnober, have purchased from Alvinza Hayward his one-sixth interest in the Mariposa grant, Mariposa county, Cal., for $166,666.66, or at the rate of $1,000,000 for the whole property. Negotiations are now pending for the purchase of other interests. The grant consists of 44,000 acres in Mariposa county. The other owners are the Hobart estate, one-sixth; John W. Mackay, one-sixth, and John P. and Sam Jones, three-sixths.

MR. BEGG has gone on to Ottawa, Canada, to present to the Minister of Railways and Canals his scheme for a railway from Stickeen to Teslin lake and ask for government aid. His plan is to reach the Yukon gold fields by means of a railway from the head of navigation on the Stickeen to Teslin lake, where the headwaters of the Yukon are reached and navigation to Fort Cudahy and other points on the Yukon is available. The length of the railroad would not exceed 125 miles.

THE petroleum industry in Santa Barbara county, Cal., is gradually increasing. Colonel C. F. Crocker recently obtained right of way for a pipe line to Gaviota Landing, through which the new coast road will run, and the product will be piped to that point, a distance of twenty-five miles. English capital is said to be interested in the enterprise. Many prospect wells are being sunk in the Summerfield and other districts. It is stated that one man is pumping a well by hand and gets twelve barrels per day.

AT the late annual meeting of the Daly West Company in Salt Lake the reports showed that during the past year ore of the value of $240,000 had been marketed; that improvements amounting to $128,000 had been erected, and that $114,000 had been put into general operating expenses. There are now in the bins and upon the dumps 12,000 tons of ore, the value of which is estimated at $150,000. The policy of the management has been to take out only such ore as was necessary in the prosecution of development work. Practically no stoping has yet been done.

AT a meeting of the Executive Committee of the California Miners' Association last Tuesday, in this city, called to consider the Debris Commission bills before the Legislature, there were present by request Senators Voorhies, Chapman, Prisk and Shine and Assemblymen Power, Soward and Montana. After considerable discussion, a resolution was adopted recommending that the commissioner's term of office be fixed at four years and his pay at $10 a day while engaged. The question of salary was practically the only one at issue between the Senate and Assembly, the terms of the bill otherwise having been agreed upon.

IN the West Kootenay country, in British Columbia, the mineral lands are open to location by any person having a free miner's license, which costs $5 per year, but only one claim 1500 feet square can be staked off on a vein or ore deposit by one person. No vein or ore can be mined beyond the boundaries of such claim. In other words, these locations have no extra-lateral rights—except those taken up before 1892—on which the vein or deposit can be followed down on its dip beyond the side line. Possessory rights are secured by doing $100 worth of work each year, or paying that amount into the treasury of the province. When $500 worth of work has been done, or that amount paid in, the holder can secure full title through a Crown grant.

IN '93 Chauncey Depew was quoted as saying: "There are fifty men in New York who can in twenty-four hours stop every wheel on all railroads, close every door of our manufactories, lock every switch of all telegraph lines, and shut down every coal and iron mine in the United States. They can do so because they control all the money which this country produces." "This," says another prominent New Yorker, "is as true to-day as it was then, except that the number has been reduced to twenty-five." The statement on both sides is probably a huge exaggeration, but it implies the existence of a money power which is a reality, and which has much to do with the too violent ebb and flow of national prosperity. It also illustrates the fact that gold mining is the one form of metal production unaffected by the usual law of competition and business rivalry, thus standing unique among the business industries of the world.

EVEN as smart a man as General Alger of Michigan, just chosen Secretary of War by President-elect McKinley, and who has made several millions in the lumber business, gets cheated when he goes to Tennessee to buy mineral lands. A case in which General Alger appears as plaintiff came up last week at Chattanooga, Tenn., in the United States Circuit Court there. It seems several years ago General Alger bought of one Anderson 25,000 acres of alleged mineral lands in Franklin county, Tenn. The agents who made the sale represented the property which General Alger bought as possessing the richest deposit of coal in the South. To deceive the purchaser, they washed the hillside ledges with black paint, it is claimed, and by this ruse, the plaintiff alleges, he was induced to invest his money in coal veins of great width. The blackened rocks were made to look like coal. One would think it would take something more than black paint to draw $144,000 out of General Alger's pocket, on a supposed investment in rich coal lands in Tennessee. This beats any reported case of "salting" a gold or silver mine.

Outline of the Geology of California with Reference to Its Mineral Deposits.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by HAROLD W. FAIRBANKS, Ph. D.

For many millions of years the primitive earth was subject to violent disturbances; the crust was broken up and refused, until finally it became sufficiently cooled to permit the water to settle upon it. Then it was that the forces of erosion first began to act, which resulted in the formation of sedimentary beds along the borders of the seas. Ages followed with repeated eruptions of lavas on different portions of the surface; the formation of great mountain ranges; their erosion through the action of the atmosphere and the rain, while through continued sinking or elevation the crust adjusted itself to the cooling interior.

When life originated we do not know, for the earliest fossiliferous rocks which have been discovered contain organisms already highly differentiated, and it is believed that the time which elapsed between the period when life appeared and the beginning of the Cambrian was much greater than that from the Cambrian to the present day. Our imagination cannot conceive of such immense stretches of time, and while it is quite evident that we cannot even approximately measure them, yet we are certain that time has been long.

In studying geology, then, we begin with the Archæan, the oldest rocks with which we are acquainted and underlying the Cambrian. The basal Archæan rocks contain no fossils at present, as it appears that they have been totally destroyed by metamorphism. From these early times down to the present there is a connected series of rocks which have been deposited beneath the sea and contain greater or less numbers of organic remains. These beds do not, however, occur altogether in one region, and as there have been innumerable catastrophic disturbances, how are we to tell which rocks are the older? In some disturbed regions it is even known that the strata have been completely overturned, so that the older lie on the top. In California the problem of the age of the rocks is particularly difficult to solve, and if it were not for the fossil remains buried in the rocks a classification of the strata according to age would in many cases be impossible.

Although the western part of North America has undergone many convulsions since life began, yet there are portions of the Eastern States where there is an almost complete series of strata from the oldest to the youngest, and disturbed comparatively little. As we study this, as well as other areas in different parts of the earth, we find that there is in all places where the record is comparatively complete a regular succession of animal and plant remains. The oldest are the lowest and simplest in structure, while the younger represent gradually higher and higher types down to the present. When once this organic scale has been established with some certainty we are in a position to apply it to disturbed regions where the series of rocks is not complete. In California the strata are most remarkably broken and disturbed, and it is only by comparing the fossils found in them with those from other parts of the earth that we establish their relative ages. This is not always an easy matter, for not only was the progress of life not absolutely uniform in all parts, but the fossils may be in poor condition and few in number.

We have established, then, a scale of life for classifying the sedimentary rocks of the globe, and when we have added to this the fact that similar strata are deposited under similar conditions in lakes or on marginal sea bottoms, we are fairly well equipped for beginning geological investigations.

There are also other criteria for determining the occurrence of various events. If we examine a great cliff in a canyon or on the seashore it appears to be made up of regular layers of different kinds of rock, as for instance, sandstone, shale and limestone. These may be horizontal, or inclined with bends and fractures, but it is known that they were formed originally in a nearly horizontal position beneath the water, and the position which they now occupy is due to mountain-making movements. In undisturbed portions of the earth these parallel layers may constitute beds of many thousands of feet thickness and have required for their formation millions of years. On the western side of the Sacramento valley the upturned Cretaceous strata have the remarkable thickness of 30,000 feet.

Great convulsions have not generally affected the whole earth at one time, so that geologists in arranging a classification of strata cannot use breaks in the strata in one region for determining the position of those in another. The different periods of geological time to which names have been given are thus not always clearly marked off in various parts of the earth. While in California the oil-bearing strata belonging to the Miocene are distinctly marked off from the other formations above and below, rocks of the same age may in another portion of the country blend into those adjoining. I hope by means of these illustrations to have made clear the fact that terms which we are accustomed to see applied to different formations do not imply that they are everywhere marked off by geographical catastrophies. The great breaks are not generally world wide, and life has moved on in comparatively undisturbed conditions in some places, while in others the strata have been violently upheaved or depressed and life in those places destroyed.

The names which have been given to the successive portions of geologic time from the earliest records down to the present are the following: Archæan, Algonkian, Cambrian, Silurian, Devonian, Carboniferous, Triassic, Jurassic, Cretaceous, Eocene, Miocene, Pliocene, Quarternary. Each of these in different portions of the earth is divided into local stages. Nothing is known definitely about the time length of these divisions beyond the fact that they are probably measured by millions of years. One not familiar with geology may ask: What is the advantage of these names, and what real meaning do they convey? As I have said before, the successive groups of rocks to which the names have been given are found in some portions of the world in regular order one above the other, and with a definite series of fossils in them. Take the great coal period called the Carboniferous. It is characterized everywhere by similar fossils and plants—a fact which has been demonstrated at the expense of years of toil on the part of the scientist. If now in examining the rocks in different parts of California, as, for example, in Shasta county or in the main gold belt in the Sierras, we find certain fossils like those of the Carboniferous of the Middle and Eastern States, we know that we have rocks of that age in California and that there is a possibility of finding coal. The coal of the Carboniferous is of good quality, and it would be greatly to our advantage to possess it. Study of these rocks has, however, led to the conviction that nowhere on the Pacific coast does coal of this age occur. Coal beds require peculiar conditions for their formation—low, swampy or partly inundated areas, either inland or formed by partly inclosed lagoons along the ocean. Now, in California the strata of the Carboniferous period are characterized by an abundance of limestone and shale, which were probably formed in the deep quiet waters of the open ocean at some distance from land.

It is rare that all the geological formations occur in any single region, for, in order to have them all present, that region must have been continuously beneath the sea and receiving sediments through all known geologic time. In California many of the main geological periods are separated from each other by great upheavals, while the strata of some are absent. As a result of this they rest upon each other in unconformable position. By this is meant that the lower ones dip at a different angle from the upper and present a more or less uneven surface on which the upper was deposited. This is a very important condition to be observed in working out the geological history of any region, for it is positive evidence that between the periods of deposition of the two series of rocks the country was raised from beneath the sea, perhaps to form a mountain range, and exposed for thousands of years to the action of rain and other disintegrating and erosive influences, until possibly worn down nearly to the sea level again, after which it sank and a new series of sediments formed over it. Our study of the Coast Range shows that with them this has taken place many times.

At the time of each disturbance, when the crust of the earth has been broken, it has happened that enormous bodies of molten rock have been forced up into the rocks or have flowed out over them on the surface. Sometimes these have covered thousands of square miles, modifying the whole appearance of the country. The economic importance which these lava flows may acquire is illustrated well by the enormous area in northeastern California, northern Nevada, Oregon, Idaho and Washington, which is undoubtedly mineral-bearing, but which has been covered several thousand feet deep by the non-mineral-bearing lavas. Instead of mountain ranges with mineral veins, we have a vast plateau or table land of lava.

It is not believed that the interior of the earth is generally molten. It has a very high temperature, but so great is the pressure that it acts as if it were a solid, becoming molten only when the pressure is removed along mountain foldings, when it flows out through the cracks or lines of weakness in the broken strata.

I have given above, in as plain language as possible, some of the meanings which we see implied in geological phenomena, and which the student of nature uses in deciphering the record of the rocks. It will be seen that the science of geology is based upon facts which become very instructive if properly interpreted. All theories in geology are to-day, as far as possible, compared with actual fact, and we can be reasonably certain that the major part of the conclusions reached are reliable, and not mere guess work.

With this preliminary, which seemed necessary to make the subject clear, I will now take up an outline of the geological history of California as far as it is at present known, beginning with the earliest rocks and tracing them down to the present, discussing at the same time the events which led to the formation of the great mineral deposits of different kinds which are scattered up and down the State.

The western border of the American continent has been the scene since the earliest time of violent foldings of the crust and volcanic disturbances, and its geologic history is correspondingly complex and difficult to decipher. A great deal of study has been given to California, but we are still far from possessing a satisfactory knowledge of what has taken place here. The changes in topography, as well as geography, have been so great that, accustomed as we are to think of the hills and valleys as always existing where they are now, I fear that I cannot adequately emphasize what the intensity of the changes has been.

We have a fairly good idea of the great Archæan area in the northeastern United States and Canada, but in the Cordilleran region our knowledge is not yet very definite. A belt of these ancient rocks has been traced northwesterly through the Rocky mountain region, while nearer, they occur in the Grand canyon of the Colorado; but, as far as California is concerned, we cannot yet say anything definite, for they have not been positively recognized here. The Algonkian is generally associated with the Archæan, and, consequently, we know as little concerning it. A part of the California region, at least, was beneath the sea during that period.

The Cambrian, the oldest group of fossil-bearing rocks, has recently been discovered in the Inyo Range, in eastern California. Rocks of the Silurian period have been found in Plumas county, the Devonian in Shasta and Siskiyou counties, while the Carboniferous appears at many points through the whole gold-bearing region of the State. It is evident that much of California was beneath the sea during the long time represented by these periods, for we must remember that where rocks of a certain age occur that region was submerged during their formation, and probably above water where the strata are absent. These strata now appear as limestone, sandstone and slate, or have been changed to their metamorphic forms as marble, quartzite and mica schist. The relative ages of these older beds have been determined by the fossils contained in them—those animals which populated the world so many million years ago, and which have sometimes been so finely preserved that even the most delicate structures and markings are still visible. During the period from the Cambrian to the Carboniferous land probably existed in western Nevada, and, quite possibly, in the Coast ranges of California. Geologists have generally considered the Coast ranges to be of quite recent origin, but there is nevertheless a granitic axis stretching from Point Reyes southeasterly through the Santa Cruz, Gavilan, Santa Lucia and San Jose ranges toward the San Emedio, San Gabriel and San Bernardino ranges, which, I think, is older than the Sierra Nevadas, and may possibly represent the oldest land area of California. It may be asked: What is the reason for supposing the Coast ranges to be so ancient? It is as follows: Through all these mountains there are no rocks carrying fossils older than the Jurassic (a time just antedating the great gold deposits), and it follows that where all the more ancient rocks are absent, we have good reason for believing that the region existed as land above the sea, for then no extensive rock formations could have been made. It is believed that some time after the close of the Carboniferous (Calaveras formation) land still existed through a part of the Sierra Nevada region, as well as in the Coast ranges.

It may be that gold-bearing quartz veins were formed in this ancient mountain region, as pebbles occur in places in a conglomerate at the base of the Mariposa beds. It is thought by Mr. Lindgren that the gold in this conglomerate, which is exposed on the divide between the middle and north forks of the American river, was derived from those ancient veins; but this is not at all certain, and it seems to me that we have no good evidence of gold deposits antedating the formation of the Sierra Nevadas as a great mountain range at the close of the Jurassic.

(*To be Continued.*)

Rapid-Drop Stamps.

The following description of a rapid-drop stamp mill comes through our Colorado agent from Newell & Newell, of Central City, Colo.: "We have a 10-stamp rapid-drop section in our Penn mill, equipped with Bolthoff self-feeders and Gilpin county bumping tables. These stamps weigh 550 pounds and run about sixty-two drops per minute, with a drop 9 inches. Dimensions of mortar: 9 inches at bottom and, say, 10 inches at bottom of screen. Discharge, about 11 inches. The average percentage of amalgamation is about equal, inside and outside. We use a 50-mesh screen—in fact, the same screen as we use on our slow batteries, running side by side with the fast.

In this mill our plates have an inclination of 2½ inches per foot. The ten rapid stamps crush fully as much as the twenty-five slow stamps, all of them running on the same quality of ore. The percentage of values saved on the plates and in concentrates is slightly in favor of the rapid stamps. It is our intention to replace our slow stamps with the others whenever they are worn out.

Will say we have tested them thoroughly on other

ores as well as our own, and are perfectly satisfied that the rapid-drop stamps, so-called (though really a compromise between a rapid drop and a slow drop), have come to stay, even in slow-going old Gilpin.

We have also our Iron City mill, which is a complete, automatic, modern, quick-drop mill—that is, running at a speed of about sixty-two drops a minute and containing twenty-five stamps—equipped with Bolthoff feeders and Gilpin county bumpers. In this mill the stamps weigh 650 pounds and the plates have an inclination of 1¾ inches per foot. We believe two inches would be about the proper thing.

NEWELL & NEWELL.

Central City, Colo., Feb. 5, 1897.

The West Kootenay Mines.

The following are extracts from the report just published by the Bureau of Mines of British Columbia on the Slocan, Nelson and Ainsworth mining districts in West Kootenay and written by William A. Carlyle, the Provincial Mineralogist:

The mining industry of British Columbia, apart from the placer, gold and coal mining, is of very recent inception. Until eight or nine years ago the great extent of the mountainous country south of the Canadian Pacific Railway to the boundary line was a wilderness known to few save the Indians and hunters, or the prospectors for gold diggings, but the finding of silver-copper ore on Toad mountain, and the beginning of work on the silver-lead ore deposits on the east of Kootenay lake, discovered many years ago by men in the Hudson Bay Company's employ, with the subsequent discovery among the mountains near by of other silver ledges, signalized the commencement of mining in Kootenay. But it was not until 1890–91 that these silver veins were beginning to attract mining men to this Province from abroad, and active operations were getting well under way.

Work, nevertheless, on some of the veins was persevered in, and in 1894 nearly $650,000 worth of silver ore was sent out of Kootenay. Then better means of communication were provided, and in 1895 the production of the different kinds of silver ore increased to over $1,000,000, which production has been doubled in 1896.

Meanwhile the gold-bearing pyrrhotite deposits on Trail Creek were being exploited under many vicissitudes, until the shipments of pay ore, in 1894, to the value of $75,000, and of nearly ten times this amount, in 1895, from the large ore bodies of the Le Roi and War Eagle, commanded wide-spread interest by reason of its being gold ore and very profitable.

The production of the Kootenay mines, when compared with that of many of the mining centers in other countries, will not appear so very large to a casual reader, but when all the conditions are understood, that an entirely new country of large territorial extent is being rapidly opened up under difficulties, that the supply of needed capital, until recently, has been meager, and that in reality not a single mine has had time to do sufficient development to put it on a really proper basis for extraction of ore and further exploratory work, this production will then be seen to indicate a most flourishing and hopeful condition of affairs.

As to the future there is now no doubt but that the number of paying mines and the mine output will steadily increase in the districts to be described, but not with that extravagant rate of increase predicted by some—at least not until those conditions exist that will permit the extraction of a much greater tonnage of ore.

There promises to be a steady increase in the amount of the ore extracted and sold, and in the amount of development done, but it is both unwise and hurtful to predict very large and sudden advances in the mineral output, as it must be remembered that a greatly increased output requires also a greatly increased amount of underground work, unless large bodies of very high-grade ore are uncovered. Extravagant prophesies may travel far, and, if the actual results do not approach the amount thus foreto'd, harm unjustly a mine or district, in which the progress has been most favorable and satisfactory, quite equal to the expectations of those best qualified to know.

The Slocan.—The Slocan, according to the number of its shipping mines and the amount and value of the ore sold, now ranks as the most productive mining district in the Province and in point of importance is not surpassed by any other.

In an area of fifteen by twenty-five miles there have been discovered many veins of high-grade silver-lead ore, which are being developed with great vigor and success, and among the mining men is every feeling of confidence and hopefulness. This winter nearly fifty of these properties are shipping high-grade ore that yields very profitable returns, and a large number of other claims are being opened up.

So far but comparatively little imported capital has been expended here, as in the case of nearly every mine now established sufficient money has been realized from ore extracted during development to pay for more extensive workings, new buildings, mills, trails, roads and also dividends, but more or less capital will be required to properly open up many other claims on which the veins exist, but are not so easily accessible as those first discovered. But as most of these veins are found along the steep mountain sides and can be worked by tunnels, and the cost of mining is low, requiring little or no machinery, capital will be necessary mostly when tramways and concentrators are to be built, or, in some cases, for hoisting plants and pumps when tunnel sites may not be available.

Many of these mines are located near the summits of the high precipitous mountains at an elevation of 5500 to 6500 feet above sea level, where erosion has cleared away nearly all debris from the veins; but lower down, also, on the mountain sides and in the valleys, are being found other veins, or those discovered first much higher up, to the highest of which now run good trails or wagon roads, or else wire-rope tramways. The snow that lies deep on these summits during the winter is in no wise detrimental to mining operations, as most work is done after its fall, when the ore can be dragged down the smooth snow trails in rawhides in larger loads and at lower prices than are possible in the summer time, but the tracks of snow-slides must be carefully avoided.

During 1896, 18,215 pounds of ore yielded 2,141,088 ounces of silver and 19,210,666 pounds of lead, or an average of 117.4 ounces of silver per ton and 52.7% lead, which would have a net profit of about $75 per ton, while many carloads were shipped that yielded from 300 to 400 ounces of silver per ton.

The Slocan Star has, of course, the largest chute of high-grade ore yet found in this district, and we are kindly permitted to state that from 11,529 tons of ore and concentrates sold during the last three years 912,600 ounces of silver and 13,482,000 pounds of lead have been paid for by the smelters, and of these amounts 7000 tons yielded 600,000 ounces of silver and 9,000,000 pounds of lead during the past season of 1896.

Many of the veins are small, varying from 2 to 3 inches in width to 20 to 30 inches of solid ore, but the high value of silver at present makes this ore very profitable, together with the low cost of breaking ground. The small Reco-Goodenough vein, the width of which is measured in inches, is probably the richest vein yet mined, as from the smelter returns of about 600 tons the average was 407 ounces of silver per ton and 42% lead. The high percentage of lead makes this ore a very desirable one for the smelters, and the lead contents are usually sufficient to pay the freight and treatment charges and the duty charged on the lead.

At no time in the history of this district have so many mines had high-grade ore exposed, and of such mines can be named among others the Slocan Star, Ruth, Wonderful, Monitor, Idaho, Alamo, Cumberland, Ivanhoe, Queen Bess, Wild Goose, Payne Group, Slocan Boy, Washington, R. E. Lee, Last Chance, Noble Five Group, Reco, Goodenough, Blue Bird, Antoine, Surprise, Rambler, Best, Dardanelles, Northern Belle, Whitewater, Wellington, Charleston, Lucky Jim, London Hill, Reed and Tenderfoot, Fisher Maiden, Thompson Group, Galena Farm, Enterprise, Neepawa, Bondholder, Two Friends, Howard Fraction.

Nelson.—The Silver King silver-copper mine of the Hall Mines Co., Ltd., the Poorman gold (quartz) mine and some small placer workings have yielded all the production credited to this district, but other mines will be added ere long to this list. Since the completion of the smelter at Nelson there has been greatly increased activity at the mine of this company.

The Silver King mine has now shipped 31,000 tons of ore that yielded 800,000 ounces of silver and 2,500,000 pounds of copper, and the development of the property is rapidly being pushed, so as to permit of a greatly increased output, while the smelter is being increased so as to undertake the treatment of all classes of ore as may be bought in the market.

The Poorman gold mine has given up about $100,000 from its quartz ledge, and other properties in this locality that have similar veins are now under bond and will be worked.

The new district known as the Salmon river country, lying south of Nelson to the boundary and traversed by the Nelson & Fort Shepherd Railroad, was not visited, but during the past year many claims were staked off on gold and silver leads on the ridges, between which run the tributaries of this river.

Ainsworth.—The output from Ainsworth for 1896 was much lowered by the cessation early in the year of mining on the Blue Bell, in which, it is reported, the ore has become rather low-grade for present conditions, but in several of the other mines west of the town of Ainsworth considerable progress was made.

Industries says the ore atomic process is now in successful operation in West Australia. The process consists in first crushing the gold-bearing quartz to lumps of a convenient size, which are then, in a closed chamber from which the air is excluded, submitted to the heat of a furnace, to the action of water, and hydrogen gas. The sulphur in the ore is thereby eliminated, being driven off as sulphuretted hydrogen, and any oxide in the ore is reduced to the metallic state. After being thoroughly heated the material is suddenly quenched by the injection of cold water. The operation is repeated several times, until the quartz is so softened as to be easily crumbled into powder by the fingers. The contents are then thrown into tank and the gold separated by washing. It is claimed that in this process there is no loss whatever by "float gold" or by oxidation, but that every particle of gold in the ore is recovered. The amount of fuel consumed in the operation is variously stated, and will no doubt have a considerable bearing upon the comparative economy of the new process.

How to Thaw Powder.

Harry A. Lee, late Commissioner of Mines of Colorado, writes to the Denver *Republican* as follows on the dangers of thawing dynamite:

The records of the bureau from December 1, 1896, to date show eleven men killed and eleven men seriously crippled, making a total of twenty-two casualties from powder explosions in two months. The causes of these accidents are picking out missed shots, the use of iron or steel tamping bars, and the warming or thawing of frozen powder.

At this season of year explosions are caused by thawing powder in front of a fire or blacksmith forge, on boiler walls and previously heated hot sand, by dipping in hot water, thawing in can heated by by candles or by holding in flame of candle. Few nitro-powder consumers seem to be aware that quick thawing or the application of dry heat of high temperature is the cause of explosions.

Of the twenty-two noticed, all of the men killed or injured were old miners and were pursuing customs which they had followed for periods varying from five to twenty-five years without fatal results.

Where mining plants have steam power the expense of providing a water jacket powder warmer is trivial. For smaller operators there are now several portable powder warmers in the market which can be procured at a cost from $2.50 to $5 each.

The warmer, as a whole, is a cylinder, 10 or more inches in diameter and about 20 inches high, with a bail attached like a bucket for carrying around. The top part is practically a vessel within a vessel, made water tight. The inner vessel is the receptacle for the powder and is securely fastened to the outer vessel at the top and provided with removable cover. The space between the two vessels is filled with water through a spout. The compartment below may be termed the fire box, has a door and proper opening for ventilation and a candle stick to hold two short candles or snuffs. The size here described will hold about eight pounds of powder, but can be procured of any dimension desired.

The miner fills the outer space with water, the inner one with powder, lights the candles and goes to work. The heat from the candles being so small the increase in temperature is slow, but sufficient to heat and thaw the powder within two or three hours after charging. The candles burn out and the water retains heat enough to keep powder in good condition for several hours longer. The owners of these warmers at first used a coal oil or furnace lamp attachment for supplying heat. These attachments were not approved of and it is gratifying to state they have been changed and candles substituted. The reasons urged against the lamp were quick and possibility of long-continued heat through neglect. Nitro-powder and coal oil are comparatively safe when properly cared for, but a dangerous combination when neglected.

The consumer of nitro-powder would do well to give some time and study to the manufacture, use and abuse of explosives. Literature on these questions will be furnished by any of the powder companies upon application.

National Miners' Bureau of Information.

An association has been incorporated under the laws of the State of Colorado called the National Miners' Bureau of Information, with headquarters in Denver. The organization is officered as follows: Thomas B. Everett, general manager; Henry Apple, treasurer; M. C. Jackson, secretary, who, with J. T. Cornforth, W. M. Ingersoll, L. H. Flanders, S. G. Patrick, W. B. Rundle, C. P. Wicks, W. B. Cornforth and C. H. Olmsted, constitute the Board of Control. Spacious quarters have been provided at 1628–34 Lawrence St., Denver.

The plans of the promoters of this bureau contemplate that any miner, prospector or mine owner, having a property, but not having funds with which to develop it, may place with the bureau specimens of his ore, with certificate of assays and data as to location, development, grade of ore, process required, etc., and, by becoming a member of the bureau, he shall have the facilities which it offers members for coming into touch with investors. The interests of the bureau are not to be confined to the promotion of gold and silver mining, but extend to copper, lead, iron, coal, marble, oils and kindred products.

It is anticipated that the membership will include representatives from all the mining sections of the entire West.

Mining Summary.

CALIFORNIA.

Amador.

Record: At the Balliol mine considerable delay has been caused in building the 40-stamp mill by the bad condition of the roads. In the mine at a depth of 60 feet they have a 78-foot vein. Forty feet of this is solid ore carrying from 3 to 5 per cent of sulphurets and yielding well in free gold. The remaining 38 feet of the ledge carries a softer character of quartz, but equally rich in free gold.

At Volcano Superintendent Dillon is putting a crew of men at work on the Excelsior mine.

The Iron Mass mine will soon resume operations.

A new quartz claim is being opened near the Excelsior and Iron Mass mines by the Robinson brothers.

The Live Oak mine is making good progress and will be ready to crush ore the last of this month.

W. Dent and H. King have struck good pay in the Blazing Star mine.

Dispatch: At Volcano W. Lyle is having the water taken out of the Eagle mine, with the intention of opening it up once more.

The Tom & Dick, owned by Atkinson & Taylor, has been bonded to Haskins & Chase, and they are erecting a 10-stamp mill on the property.

The old Soracco or Alta mine, owned by J. Eckhart, has been bonded to a strong company and they are to commence work soon.

Ledger: The shaft at the Oneida is now down 745 feet. The new skips have not yet been hung, but will be in a short time.

Mr. and Mrs. Timms have sold the Plymouth Rock mine to Cyrus E. Brown and James A. Parsons of San Francisco.

The shaft at the Amador Queen is now down about 500 feet. The small hoist now in use on the property is proving inadequate for the work at that depth, and they will take down the Amador Gold Mine hoist and erect it on the Amador Queen property.

Butte.

Register: At Magalia at the Peter Wood mine, of which E. C. Paxton is superintendent, eighteen men are employed and the main tunnel is being extended on the channel.

More men are employed in the Magalia mine than ever before known in its history.

The Ethel, formerly known as the Index or Wiley mine, is being pushed day and night under the management of W. D. Edwards. Three shifts of men are driving the main tunnel ahead.

George B. Mowry, superintendent of the Bader mine, employs eighteen men. The tunnel is now in 1500 feet.

The Oroville mine on the Main West Branch owned by Walsh, Vosberg and the Downer Bros. is turning pay from a channel of gravel they have lately struck.

Ream & Barry have opened a mine on the west branch of Main Butte creek, near the John Dix mine.

Lambert & Co., on west branch of Butte Creek are opening a mine on the Ohio ground.

At the Best mine, on Main Butte creek, seven or eight men are employed under Superintendent Jas. Ream.

Marysville *Democrat*: At the Templar mine near Indiana Ranch for several months a 5-stamp mill has been operated and all of the work has been performed in a manner that satisfied the people who have bonded it that the mine is a good one and will pay dividends. The bond price was $20,000 and it is said the company will enlarge the capacity of the mill to ten stamps.

Calaveras.

Chronicle: The mine on the Gabbert ranch has been sold and the parties are getting ready to sink a shaft 1000 feet. This property is located about two and one-half miles west of the mother lode, in the serpentine formation, which can be traced for a distance of fifteen miles running north and south.

The Sugar Pine mine, on San Domingo ridge, has been bonded to McClay and Tretheway for $6000. A shaft 45 feet deep has been sunk, exposing a 2-foot vein of rich ore.

Toda and Schrack, on their mine, have a tunnel 600 feet in length. At about 500 feet they passed through a vein of quartz 12 feet wide of the same character as the Gwin.

At the Gwin mine work is being prosecuted on the 1200, 1300 and 1400 foot levels running north, which keeps the forty stamps going steadily. When the mine is opened up as the owners intend it to be, it will be easy to keep twice the amount of stamps running.

El Dorado.

(Special Correspondence).—On the Lucinda property, three miles west of Grizzly Flats, development work has progressed favorably. The tunnel is in 120 feet on a 22-inch vein. This is owned by Mrs. Nail.

On Mrs. Hoskins' property, two miles north of Grizzly Flats, the tunnel is in 250 feet and crosscutting on the ledge has been commenced.

Work is progressing favorably on the old Jeffries gravel claim, two miles from Placerville, preparatory to beginning milling operations. The property is under bond to Graeter & Doane.

The reopening of the long-time abandoned Columbus mine, a rich producer in its time, and from shallow workings, located at Cold Springs, five miles west of town, is receiving the consideration of several capitalists.

C. W. D. Hodgkin is operating a gravel property in the neighborhood of Shingle Springs.

Reopening the old Barnes property, generally known as the Greenstone mine, nine miles southwest of here, is actively in progress. This property was never operated to any great depth, yet the Wells-Fargo records of the Shingle Springs office show it to have shipped many thousands of dollars' worth of gold, pure metal that filled many a candle box for the lessees.

The Black Rock hydraulic mine, one mile east of town, is producing an encouraging amount of gold.

Development work in quartz properties under bond is assuming encouraging proportions in all directions from Placerville throughout the county.

Mr. Gebhard is reopening the old Buena Vista mine, a few miles below the Church mine. He is crosscutting the ledge from an 80-foot tunnel.

The new 10-stamp mill erected on the lower end of the abandoned Springfield is working the tailings of the old-time property. It is operated by Williams & Harpending and is known as the Union mine.

Placerville, Feb. 15th, '97.

Nugget: The Jasper Mining Company, Webber Creek district, are developing their properties, the Mammoth, the Gray Eagle and the Independence. At the Mammoth they are driving the tunnel along the ledge taking out milling ore. They now have over 400 tons on their dump.

At the Larkin mine they are still crosscutting for the east ledge from the 100-foot level.

At the Griffith Consolidated they are sinking their shaft and drifting on the 150-foot level and are taking out very high-grade ore.

It is reported that a very rich body of ore has been encountered in the Taylor or Idlewild mine on the 600-foot level.

At the Grand Victory they are drifting from the 300-foot level across the vein and are in good ore.

Kern.

Times: The Winnie and Yucca Tree mines, in the Stringer district, have been sold by Cohen & O'Brien to O. H. Savage of San Jose for $7500.

Mariposa.

Gazette: A company of mining men from Chicago have the bond on the Yellowstone mine and are doing good work under the management of G. Seymour. The main shaft is down now about 420 feet. It is the intention of the company to take the present hoisting works and erect them over the new shaft and put up a new hoisting works over the old shaft. About fifteen men are at work.

R. H. Rodman of San Jose has made arrangements for the purchase of the San Leandro and Esperanzo mines on Bear creek, from the Valenzuela Bros. Mr. Rodman intends erecting a 5-stamp mill as soon as he can get the machinery on the ground.

Nevada.

Herald: On the Ellison mine they are sinking an incline shaft, of two compartments, which has now reached a depth where machinery is necessary. A hoisting rig is being put up. The Ellison adjoins the Odin on the north, and the incline is being run into the ridge to tap the lower end of the gravel channel, on which the Delaware, Harmony and other mines are located.

Transcript: The Washington mine has been worked to a depth of 400 feet, and has three shoots of ore. The longest ore shoot is 380 feet in length on the 400 level.

Hayes Bros. have been obliged to put in a pump in their gravel mine, the recent rains having raised the water.

Herald: At Washington work is about to be commenced on the Gambrinus by Dana Harmon, of the California mine. A contract has been let to extend a tunnel from the California work.

A few men are still engaged at the Spanish, though the mill has been shut down for the winter.

The Eagle Bird, Yuba, Blue Bell and German mines are lying idle though from appearances it is expected that work will be resumed at the Eagle Bird and German mines in the spring.

Plumas.

National-Bulletin: It is the intention of Superintendent J. F. Cummings in the spring to let contracts to do a great deal of tunnel and other work about his mine, which is one of the most extensive and promising in northern Plumas.

Chicago capitalists have a development bond on the Morning Star mine, owned by E. C. Robinson and others of Oakland. J. C. Frick, representing the Chicago men, is now superintending the work of sinking the shaft 200 feet deeper. He has several men employed at this work and will soon be running three shifts.

It is reported that the owners of the Frazier mine, Oakland men, will erect a 10-stamp mill early next summer and prosecute work vigorously.

The Palo Alto mine is expected to resume work early the approaching season.

In a mine near Merrimack, Oakland men last fall and this winter ran about 600 feet of tunnel. They expect to build a mill in the spring.

San Diego.

Sentinel: S. A. McDowell will start in soon taking rock out of the Hubbard mine of Banner.

The Washington mine has been leased to Grigsby, Plant and Hewitt Bros. for two years.

F. E. Allbright, owner of the Alexandra mine, Banner, is having considerable development work done.

The Alpha mine of Banner is being worked by the Stanley Bros. and Reeder.

San Bernardino.

The North Star Mining & Milling Company, organized last October to work the North Star, Gypsy, Gypsy Maid, Bobtail and Broncho Jim mines in the Virginia Dale district, has received a report from an expert employed lately, showing that the company had one shaft down 130 feet with 125-foot drift, with 17,000 tons of ore in sight, valued at $140,000, and it has been decided to push the work by sinking the shaft from 500 to 700 feet deeper and develop the mines without milling any ore at present.

Shasta.

Free Press: The Mariana Mariscano Mining Company, in the old Bell mine at Sunny Hill, has the long tunnel in about 650 feet. It is estimated that the first ledge will be struck at 800 feet, but the work will be continued until the main ledge is reached, which it is estimated will require a tunnel 1150 feet in length.

On the McCloud river rich placer diggings have recently been discovered eight miles above Baird. The Campbell brothers and Pegg & Pipher have located ground which pays in coarse gold.

Sierra.

Enterprise: A number of men went to work last week at the Craycroft and Eureka mines, there being a sufficient head of water to begin operations.

Siskiyou.

Journal: The Eastlick Brothers and Wright & Fletcher hydraulic mines at Oro Fino have been started up again with a good supply of water for the giants.

H. H. Hunter will pump out his claim on Greenhorn, at Calkin's place, and will soon be ready to commence hoisting pay gravel from bedrock again.

Charles Howell, who has a placer claim on Spring gulch, Yreka Flats, near Yreka, picked up a nugget worth $15 last week.

Siskiyou *News*: Hegler & Aldrich have been taking out quartz since the last crushing, and it is looking better and the ledge is getting wider.

C. Blenbaum is working on the extension of the Hegler ledge. They have a good prospect and are running a tunnel on it to tap it lower down.

Bull Bros. & Co. are piping in their claim on Humbug. They get a splendid prospect in the raise.

Smith & Coyle of Hornbrook have been prospecting below the railroad bunk house and have found a rich streak of gravel. They panned out one day $47, and think there is a back channel and intend to run a tunnel in on it.

Reporter: The hydraulic mines all over Siskiyou are starting up, and will be kept in operation from now until next summer. In the Salmon river country and along the Klamath some large plants have been put in during the past few years, which will largely increase the output of gold in this county.

Tuolumne.

Mother Lode Magnet: At the Alameda a new hoist is being built, an air compressor has just been put in working order, and development work is being rushed as fast as supplies will permit.

The Shawmut mine at Jacksonville is working twenty-five men. The company expect to have the mill completed in about a month.

A boiler is being placed on the Modoc mine, near the Buchanan. With the roads in condition to transport machinery and supplies, a force of men will be put to work on the mine.

A rich strike was made in shaft No. 3 of the Santa Ysabel group last week.

Another rich strike has been made on the Fleming vein near Campo Seco.

Shorey and Stover are putting a hydraulic plant on their mines near Horse Shoe Bend, which have been bonded from J. B. Doyle.

Independent: L. A. Engelke has bonded his mining property at American Camp to San Francisco parties.

The Black Oak mine has not been sold, and its owners say it will not be.

The Mullen mine near Tuttletown will shortly be reopened by John Doyle and associates.

The Rappahannock still continues to sink, the quality of the ore encouraging such a course.

Mr. Linehan of San Francisco is opening up his mine on the mother lode near Mormon creek.

The Miller and Holmes mine has found the lost Knox and Boyle vein. It was crosscut on the 600-foot level. The new 20-stamp mill is well under way.

The Golden Rule is now drifting from the 500 level and expects to cut the east ledge within a few feet. This mine is now equipped with electric lights.

The Jerrymander mine has struck a good vein of ore.

Union-Democrat: A 60 H. P. gasolene engine has arrived at the Rawhide to be used to operate the Cornish pump recently put in.

At the 600 level of the Knox & Boyle of the Santa Ysabel group very rich ore has been encountered. The ore body is large, as is usual in the mother lode properties.

On the Gerrymander it is expected to tap the main vein soon and then the erection of a 20-stamp mill be considered. The mine is parallel to the Golden Gate on the west.

At the Mammoth the big strike recently made in the mine still holds out. The pay streak takes in 6 feet of vein matter. Work is being prosecuted on the 700 level.

NEVADA.

Silver State: At the Montauk mines at Bartlett creek, which were purchased from L. Vary last fall by the Columbia Mining Company, C. A. Kinney, the superintendent, has had a force of men at work prospecting and developing them since last fall. The Derby mill was leased and started up a few weeks ago. The concentrates average about $380 per ton, while the ore works about $20 per ton on the plates. Mr. Kinney also contemplates the erection of a cyanide plant, which will work the ore to a higher valuation, as it is not entirely free-milling.

Reno *Gazette*: A strike is reported at Unionville, twety miles south of Mill City, by the Thornton brothers.

Advices received by the *Tribune* from De Lamar indicate that the April Fool Company has been seriously crippled by the recent decision concerning its rights to certain waters and that already over thirty men have been dismissed, the mill closed down and only men enough retained at the mine to enable the owners to work one eight-hour shift. This force is confined to the blocking out of ore, and until arrangements are made for water it is not likely that further attempts will be made to operate the plant. With the mill closed down, the company will, no doubt, resume the shipment of the very high grade ore of which it showed itself capable before the mill was erected, and commence the development of an additional water supply.

Austin *Reveille*: In the north end of Lander county the mill at Dean is running steadily and turning out regular shipments of bullion, and the mine is in good condition.

At Copper canyon six men are employed, and Jorey, Briley and Worst, the owners, have bonded it to Denver people, who are now at work.

At Cottonwood canyon, between Galena and Battle Mountain, is another copper mine which has been bonded to outside parties, and they have four miners at work.

There are many valuable copper mines in Lander county, and it is only a matter of time before they will be owned by capitalists.

OREGON.

Baker City *Democrat*: The Don Juan mine in Robinsonville district, owned by Kelly & Allen, produced thirty-five ounces of gold bullion—the result of a run of five tons of ore through a 3-stamp prospect mill.

At the Bear Creek quartz ledges the Victory and Hidden Treasure, owned by the Lane Bros. of Susanville, have been bonded, one of the considerations being on driving a tunnel and tapping the ledge at a certain depth and that a 20-stamp mill would be erected on the property.

Grant's Pass *Observer*: About $300 in coarse gold was brought in from the Hayes & Jewell mine on Oscar creek this week. The largest chunk weighed $180.

F. H. Mason & Co. of Spokane, Wash., have bonded the Boynton quartz mine on Jump-off-Joe for a short time in which to make a thorough examination.

Rogue River *Courier*: The Horn-Silsby-Tucker mine is piping night and day on the lower Illinois, and the first clean-up has proven it to be one of the richest placer mines in southern Oregon. Some thirty men are at work, and a ditch 3½ miles, just completed, will furnish water the year round.

The Bolt quartz mine, on Galice creek, has been sold to a company of Bavarian capitalists, who will erect a large mill to crush their own and their neighbors' ore.

WASHINGTON.

Spokesman-Review: There will be six shipping mines within ten miles of the mouth of the Methow this year. They are the Hidden Treasure, Highland Light, Monitor, Friday, Hunter and Gray Eagle. Should the Central Washington build fifty miles to the river, the question would be settled.

At Chewelai the Black Hornet is showing a ledge about 40 feet wide. The shaft is down 20 feet and the ore is improving steadily with depth. It is iron and copper pyrites, carrying gold.

At Boundary, Captain Miller, manager of the Columbia and Ontario Mining Company, has purchased for O. W. Chamberlin of Pretoria, Ont., a group of five claims for $8000 cash.

William Berwick has purchased of M. W. Brester of Waneta a quarter interest in the Nevada, a gold and silver property, located in the Lost Creek mining camp, for $1150.

BRITISH COLUMBIA.

(Special Correspondence).—Supt. Veatch of the Cinnabar Mining Co., Savonas, states that the furnaces are practically completed. He estimates an output of 125 tons of half per cent per day, making a net profit of $50.

An assay of decomposed ore from the Orphan Boy, Big Bend country, shows a return of 10 ozs. 3 dwts. of gold valued at $209.70 per ton and 1 oz. 15 dwts. of silver valued at $1.15 per ton. There are 1000 tons of ore on the dump of the Orphan Boy, and a mill recently purchased in San Francisco is on its way to the mine, which is a free-milling proposition.

The Great Northern Railway Company quotes a rate on copper ore from Victoria to St. Louis of $16 per ton and one of $15 per ton from New Westminster to Vancouver.

There is considerable mining activity at Frederic's Arm, where Cobbedick and Forsythe are extensively developing claims.

The Silver Tip mine on Taxada island is to be worked by the Taxada Proprietary Gold Mines, Limited, capitalized in $250,000 in 25-cent shares. The principal offices of the company are in Vancouver, and assays are said to show returns in gold and silver equal to from $16.45 to $44 per ton.

The Athabasca mine at Nelson is creating some stir. The Athabasca Company have eight leads, but are working now only on one. The tunnel on this lead is in 164 feet and the ore averages from 100 assays over $100 a ton free milling. A mill will be on the ground in May, or as soon as the weather permits. Ex-Minister of Finance for Canada, Foster, is at present at the property overseeing development work. GORDMAN.

Vancouver, B. C., Feb. 15th, '97.

The Tennessee and Iowa claims on Quartz creek, one-half mile from the line of the Nelson & Fort Sheppard Railway, have been sold to James McCreath of Nelson for $8000.

The exportation of ore from the Kootenay this year amounts to 3593¼ tons. The smelters have produced 1405 tons of matte. The ore shipments last week from Slocan amounted to 504½ tons. The matte and bullion shipments during the same period amounted to 383 tons, of which the Trail

smelter furnished 301 tons and the Hall Mines 82 tons.

S. Norman & Co., for themselves, and J. D. Farrell have purchased a half interest in the Reciprocity and Lillian mineral claims, adjoining the Payne group, in the Slocan.

The final payment on the Coxey group has been made by C. J. McCraig, who bought the property some time ago from John R. Cook and Elling Johnson. This payment amounts to $21,000.

Colonel Peyton states that all deals for the Le Roi are off. All the workings, including the main shaft, skip shaft, upraises, drifting, tunneling and crosscutting, amounted at the first of the year to fully 3500 feet. It is estimated that 4257 cubic fathoms of ore and waste have been taken from all of the workings, or 33,054 tons hoisted from the mine. One hundred and sixty persons are now upon the Le Roi pay-roll. The company is now hoisting and shipping about 150 tons daily. Of this 50 tons goes to the Trail smelter, and the rest goes to Everett, Tacoma and East Helena. The output is equal to a train load daily.

The ore shipments from Rossland last week were as follows: Le Roi, 715 tons; War Eagle, 350 tons; Iron Mask, 90 tons; Kootenay & Columbia, 75 tons; Josie, 41 tons; Jumbo, 20 tons.

ALASKA.

Mining Record: The following shows the yield of gold in detail for 1896:

Nowell Gold Mining Co., 35 stamps	$ 160,000
Berner's Bay M. & M. Co., 40 stamps	125,000
Alaska-Treadwell G. M. Co., 240 stamps	800,000
Alaska-Mexican G. M. Co., 120 stamps	450,000
Alaska Commercial Co., 40 stamps	500,000
Bald Eagle M. Co., 4 stamps	200,000
Ebner G. M. Co., 10 stamps	35,000
Juneau M. Co., 30 stamps	35,000
Jaulin G. M. Co., 10 stamps	20,000
Alaska-Willoughby G. M. Co., 10 stamps	15,000
Green mine, Norton Sound, 10 stamps	15,000
Total output of quartz mines	$2,355,000
Lituya bay placer mines	15,000
Cook's Inlet placer mines	175,000
Birch Creek district, Yukon mines	1,300,000
Other Yukon districts	800,000
From several small creeks in various parts of the Territory, worked by arrastras	25,000
Total output	$4,670,000
Increase over 1895	$1,670,000

UTAH.

(Special Correspondence).—Gill S. Peyton and Eastern parties have a bond on and are opening a property at the mouth of Little Cottonwood canyon. Two tunnels are being driven to crosscut the vein. Samples of ore show it to be a free milling proposition.

The Taylor & Brunton Ore Sampling Company, having sampling works at Salt Lake City, Utah, and Aspen and Cripple Creek, Col., handled in 1896 76,000 tons of ore at Salt Lake City, 100,000 tons at Aspen, and are now handling at Cripple Creek about 3000 tons per month.

At Robinson, Tintic district, the Sioux-Ajax tunnel, being driven in the locality of the Mammoth, is now in 1600 feet.

The Carissa, a copper property belonging to O'Mera & Co., is shipping about 150 tons of ore per month, which runs from 14 to 40 per cent copper.

The Grand Central people have spent at least $120,000 on their property in Tintic, and have recently made a strike of ore, rich in gold and copper, in a well-marked vein. Their double-compartment shaft has reached a depth of 700 feet.

The Northern Light cyanide mill, in Mercur district, will be in operation by Feb. 20th. The ore from the Northern Light mine is of a highly siliceous nature, is oxydized and carries gold and silver.

The Sunshine cyanide mill is not now running. Within the last few months the ores in the Sunshine mine have become arsenical and considerable clay has been encountered, which mats in the tanks to such an extent as to hinder percolation.

Captain Timothy Egan has been shipping some ore from the Golden Star mine, located on Bald mountain, near Marysvale, which ran $48 in silver and $7.70 in gold per ton. He contemplates putting in a stamp mill, as his ore is free milling.

The Valeo mine, in the Park City district, is attracting considerable interest. A body of ore has been encountered which is rich in copper and gold, with some lead. It contains streaks of high-grade copper running as high as 40 cent. The property belongs to Park City people. WASCOTT.

Salt Lake, Feb. 14th, '97.

Tintic Miner: It is reported that the Swansea Company have decided on the erection of a concentrating plant. While the Swansea has much high-grade ore in sight, which it will pay to ship even under present conditions, they also have immense bodies of low-grade lead ores which are now a dead loss, but with a concentrator would be a most valuable product.

Shipments were as follows last week: From the Bullion-Beck mine, thirty carloads of ore; Bullion-Beck mill, ten carloads of concentrates; Centennial Eureka, fifteen carloads of ore; Eureka Hill mill, eight carloads of concentrates; Humbug, two carleads of ore; Ajax, nine carloads of ore; Sioux mine, nine carloads of one; Sioux mill, two carloads of concentrates; Mammoth mill, twelve carloads of concentrates; North Star, four carloads of ore.

The Picnic shaft is down 260 feet and drift will commence in a few days. There are several streaks of high-grade ore showing in the shaft.

Tribune: Already the stimulating effect of the advance in lead upon the output of Bingham is making itself apparent, and whereas days were recently allowed to go by in which not a pound of ore was sent out, the daily average at present is about seven carloads.

On the Provo river twenty miles from Park City copper ore has been taken out of a cut 20 feet from the surface. The ledge shows a breast of 10 feet at that point. The vein from which the ore was taken is 18 inches. The same rock assayed at Salt Lake yielded 30 per cent copper, a few ounces of silver and 95 cents in gold.

Work has been started in sinking the Daly-West shaft from the 1100 to the 1300-foot level, if the present plans are carried out. At the 1300-foot level a station will be cut and drifts run out to cut the ledge.

At State Line the Gold Hill Mining Company has decided to drive two long tunnels, 500 or 1000 feet, respectively. The contract has been let for the 500-foot tunnel and the contractors commenced work on the 4th inst. The 1000-foot tunnel will be driven from the southeast side of the range, and with each of these tunnels the company expect to crosscut several promising leads, which now crop out on the surface.

Mercur *Mercury*: A good body of ore is now uncovered in the Edna May.

The Daisies are looking better than ever. A drift has been run about 30 feet on the 125-foot level, and the incline has reached a point about 40 feet lower. At both places the ore is widening out.

Men are at work on the Chloride Point and the old workings are being put in good shape.

At the Wonder a depth of 630 feet has been reached, and a station is being made at that point. In a few days the work of sinking will be continued.

Bingham *Bulletin*: Water has been bothering in the 300-foot level of the Winnamuck, but a new pump now has it under control. There is a great show of mineral at the face of the east drift.

Tibble & Hines have made a forty-ton shipment from their Phœnix lease.

The shipments from the old Jordan mine and mill this month promises to be about the same as January's—1700 tons.

Mammoth *Record*: The ore shipments from the camp were reported as follows: Ajax, nine cars; Sioux ore, nine cars; Sioux concentrates, three cars; Mammoth concentrates, 10 cars; Utah ore, three cars.

The Fisher Mining Company is putting up a shaft house on their property near Diamond.

IDAHO.

Review: At Pierce the 5-stamp mill which will be placed upon the Boles group is being loaded on wagons and taken out.

The Gold Reef, owned by Morris & Morrill, has a tunnel 100 feet deep which taps a 20-foot ledge of high-grade concentrating ore, assaying between $30 and $40.

The Idaho mine is being developed with a prospector's stamp mill. A force of men is at work driving a 400-foot tunnel, having reached a depth at this time of about 200 feet.

On Quartz creek, about eight miles from Pierce, Harris & Matthews have driven a tunnel on their property which shows a 25-foot ledge of ore, which carries copper and gold assaying $32.

MONTANA.

Inter-Mountain: The Ajax Mining Company has paid a balance of $68,400 to Connor Bros. and became possessed of the Stray Horse mine, upon which the company took a bond one year ago for $75,000. Besides that amount, the Ajax Company has paid $12,000 to the lessees. The Stray Horse is situated about six miles from Winston.

The St. Paul & Butte Company, which suspended operations some months ago owing to financial troubles, will resume work in a few days on a group of properties near Lloyd's milk ranch. Two sixty-horse boilers and an engine have been secured, and are now being placed in position.

The Agnes, southwest of the Colorado smelter, is being operated by McNerny & Co. An electric hoist and an electric pump have been erected. The lessees expect to find copper ore.

Butte *Miner*: At the Granite Mountain and Bi-Metallic mines in Granite county the immense amount of tailings accumulated in the past nine years at the mines will be worked over and it is thought will be a profitable undertaking for the company. The mines are kept in good condition at a good deal of expense to the stockholders and it is figured that at least enough can be taken from the tailings to pay the general expenses of keeping the mines in condition.

Western Mining World: The annual output of the Bald Butte Mining Company shows a profit during the year of $38,845.22. Development was as follows: Tunnel 578 feet; levels, 489 feet; winzes, crosscuts, etc., 325 feet; total, 1,392 feet. This work cost $12,720.22, an average of $9.14 per foot, including grading and laying track; extracted and put into the bins 24,258 tons of ore, at a cost of $38,843.12, an average of $1.43½ per ton. In addition there are 3,600 tons of broken ore in the mine, and 59,900 tons in the reserve above tunnel No. 1. During the year the mill has dropped its forty stamps for 333.05 days of twenty-four hours each, crushing 23,458 tons, an average of very nearly 70½ tons per day, at a cost of $21,684.12, an average of 92⅔ cents per ton. This average cost is divided as follows: Labor, about 61 cents; wood, about 18⅔ cents; supplies, about 13 cents; total, 92⅔ cents. This ore has yielded bullion to the net value of $124,-030.38, an average of $5.29 per ton. In addition it has yielded 152 tons 857 lbs. of dry concentrates, of the net cash value of $8,811.01, an average of $57.80 per ton of ore. The total net yield per ton of ore milled is therefore $5.67½.

WYOMING.

Notwithstanding heavy snows, the work of prospecting and developing the Grand Encampment mining district is being pushed vigorously. A contract has been let by the owners of the Golden Eagle for a 300-foot tunnel for a water level inlet to the lead. A carload of ore from the Tom Thumb mine runs about $285 to the ton.

There has been received at Laramie thirteen carloads of steel pipe for the Independence mountain placers. It was purchased in San Francisco. When in position the pipe will cover a distance of over two miles. It tapes from 24 inches down to 10, and it will be put in at a point where the fall is 300 feet. The ditch from Big Creek lake will be completed by June 1st, will be fourteen miles long and will carry 5000 miners' inches of water. At the bottom it will be 10 feet wide, and the total cost, when everything is in working order, is placed at $75,000.

SOUTH DAKOTA.

Black Hills *Times*: At Ragged Top the Crown Hill Mining Company will, on the return of S. E. Young from Ohio, inaugurate extensive development work. Ore shipments from this new camp now average from twenty-five to thirty tons per day.

The Ragged Top Gold Mining Company, owners of the Iva group, take out and ship from thirty to fifty tons per week.

All of the ore outside of the Dacey & Kilpatrick Bros.' property, is virtually taken from the surface, none of the workings exceeding 30 feet in depth.

Hattenbach & Co., owners of the Metallic Streak group of claims, situated on the southwest slope of Ragged Top mountain, have opened up a body of oxidized iron ore that assays from $47.20 to $81.79 gold per ton.

The new mining camp on the line of the B. & M. railroad, between Pringle and Loring station, is alive with excitement over recent discoveries.

The Demereau Mining Company, now operating near Pringle, south of Custer City, are pushing work on their development tunnel, now in 200 feet. One vein 30 feet in width has been crosscut, the ore assaying from $16 to $32 gold per ton.

The Striegel group of claims, in South Ruby Basin, consisting of thirteen locations, near Englewood, has been bonded for a short time to eastern parties. A cash payment of $5,000 has been made to the owner, John Striegel.

The Sunnyside management at Hall City are preparing to sink the shaft an additional 100 feet. The vein has steadily improved with depth, and the mill is being run constantly on excellent ore.

A new discovery of siliceous ore has been made south of Englewood, on the line of the B. & M. railroad, samples of which assay from $10 to $180 gold per ton. The formation is lime porphyry or phonolite.

In Yellow Creek Camp the Wasp No. 2 Mining Company have encountered another bonanza in the claim. The shaft in now exposed for over 30 feet in width, and still extends beyond the sides of the workings.

C. A. Stephens & Co. secured a sixty days option and lease on the old Uncle Sam lode, adjoining the Harrison, for $7,000.

The shaft of the National Mining Company on Sugar Loaf hill is now down 250 feet, the last six feet being in a soft chalky material above which 20 feet of blue shale was passed through. It is now believed that another stratum of shale will be found before the ore contact is encountered.

NEW MEXICO.

La Belle *Cressett:* V. G. Hyatt of Pueblo, Colorado, has purchased the Golden Treasure properties in Placer gulch for $10,000.

COLORADO.

LEADVILLE.—(Special Correspondence): Despite the baneful effects of the long-continued labor troubles in Leadville, the district is outputting 1200 tons of ore per day, and there is discernible a rather hopeful feeling and an actual improvement in business. About 1300 men are now employed at the various properties higher up on the hills, though the downtown mines are still closed down. It is learned that perhaps a majority of the men now employed are former members of the local miners' union, who have withdrawn therefrom. I find no hostility among mine owners to labor unions in general, though an actual settlement of the difficulty between the mine owners and the Leadville Miners' Union, as at present controlled, is a thing unlooked for. Unquestionably, the present situation will find a solution only in the time required for the antagonism to wear itself out.

A very important and encouraging matter for Leadville is the action of the Illinois Steel Works in deciding to draw its entire supply of manganese of iron ore from Leadville. It is estimated that 50,000 tons will be required for 1897. This decision is due largely to the efforts of Mr. Geo. W. Cook, Colorado agent of the Illinois Steel Works. The Leadville manganese of iron, after having been thoroughly tested by that company in 1896, was found to be entirely satisfactory. Formerly the Illinois company obtained its supply of this ore from Cuba, Chile, Russia and Japan. The result will be to double the output of iron in Leadville. By reason of a reduction of smelting charges, as low as 3 ounce iron can be handled. Immense bodies of this low-grade ore are in reserve in many of the older properties, which, under the present charges for smelting and the prospective demand, will doubtless be handled.

Among the properties which produce manganese of iron to a marked degree are the Star, Matchless, Chip, Stag, Bison, Denver City, Japan, Jason, Iron-Silver, R. E. Lee and Yankee Doodle. WASCOTT.

Leadville, Col., Feb. 10th, '97.

Denver *Republican*: At Cripple Creek the Ingham on Raven hill has produced 200 tons of ore in the past eighteen days.

Pay ore has been found again in the Ruby on Bull hill by the new workers. After nearly a year of idleness the property was recently secured under bond by T. W. Armstrong, representing a Detroit syndicate.

A Boston company, organized as the Colorado School Land Mining and Leasing Company, is putting up a compressor on Beaver creek above Gillett and will drive a tunnel with air drills into the foothills of Pike's Peak.

The question among Bacon hill workers at the present time is how far they will be allowed to sink on the many new finds before water becomes a serious interference. Dozens of shafts are being pushed down at the present time and no advance measures are being taken toward draining the hill.

Granmer brothers are removing a 10-stamp mill down from Park county and setting it up in Arequa gulch, near the Elkton mine. They will experiment for the best process for handling the tailings and are undecided whether to use cyanide or be content with table concentration.

The report of President R. J. Preston of the Prince Albert Company shows the gross production by lessees since last August has been $59,338.95; 1,045 tons of ore yielding 2,973⅛ ounces of gold and 655¼ ounces of silver. The company received as royalties from the ore $11,324.34. For the ensuing year the new work outlined contemplates the completion of the crosscut from the Gold Dollar tunnel, by which 200 feet of new stoping ground will be opened.

During January the El Paso chlorination mill at Gillett handled 1,407 tons, extracted $40,027, making a daily treatment of forty-five tons of ore of an average value of $28. Work has been commenced on the new plant of 150 tons daily capacity being built by the company at Florence.

W. S. Stratton is developing his two consolidations on Globe and Ironclad hills with a view to finding the right point for sinking a main working shaft to great depth.

ARIZONA.

Republican: At the Black Warrior the ore in sight is estimated at 300,000 tons. President J. A. Flemming has arrived to consult with Superintendent Hill and John Whyte in regard to reduction works. The kind of works that will be erected is yet to be determined, but in all probability both leaching and smelting will be employed.

Prescott *Journal-Miner*: T. G. Massicks, general manager of the Lynx creek hydraulic works, has his boiler in position and will start up his steam shovel and amalgamator soon. He has experimented with this enough to demonstrate its adaptability for extracting the gold from the gravel beds, at a minimum cost and with the use of very little water.

Tucson *Star*: Stiles & Mayhew, of Casa Grande, have sold their recently discovered copper property a few miles south of that town for $60,000, and a smelter will be placed upon the ground at once.

The mines in the neighborhood of Casa Grande are rich, and are attracting a great deal of attention of late. It is understood that the Silver Reef properties have just changed ownership for a consideration of $75,-000.

In the Oro Blanco district Chicago parties have purchased the Con. Arizona mill and two gold properties, and will start up at once. The Oro mill is running on a good grade of gold ore from the Oro mine.

There are sixty men employed extracting ore and freighting it to the Rosemont smelter which it is expected will blow in in a few days.

The Twin Butte mines in the Sierrita district, of Baxter associates, are producing a high grade of copper ore from their 125-foot level, the average being over 30 per cent.

Parties from the Pierce mines say that the output is larger than ever before. Two pulverizing mills have been purchased and are in transit. The capacity of these mills is fifty tons each per day. These pulverizers have become very popular throughout South America and at several points in New Mexico and throughout the Rocky mountain region.

Mojave *Miner*: The Excelsior Mining and Milling Company has acquired title to thirty claims in Indian Secret mining district. The amount paid for the properties is said to have exceeded $2,000,000. R. D. Root engineered the deal and an English syndicate is the purchaser.

Prescott *Courier*: The Lottie mill is running night and day with its ten stamps and four concentrators.

The Annie is running its ten stamps and three six-foot concentrators. A rich strike was made in the bottom of the shaft, at a depth of 200 feet. The ore is sulphuret and and shows free gold.

The Henrietta mill has started up with twenty stamps and eight concentrators. The managers have put on a full force of men, besides letting several leases.

The Jessie mill is running ten stamps and four concentrators night and day. Superintendent Doran is having the other ten stamps fixed up. The greatest output of value from this mill is free gold, although it is a steady shipper of concentrates.

Phœnix *Republican*: The 400-foot level of the Crowned King mine at Big Bug shows better ore than any of the upper levels, thus keeping up its reputation of improving with depth.

A deed has been filed for record from M. H. Angeyine and J. T. Robertson, to the Silver Spring Gold and Silver Mining Company, for the Growler and Silver Spring mining claims, located on the Hassayampa. It is stated that a mill will be erected soon on the property by the company.

At Kingman the Elkhart mine is to have a 100 ton concentrator.

LOWER CALIFORNIA.

Lower Californian: Work has been resumed on the Aurora mine at Alamo. Three weeks ago the pumps were started and the shafts of both the Aurora and Princessa have been drained to the 150-foot level, where they are connected by a drift. Exploration work has already begun on the old works, and a number of drifts will be run. Last week a good body of ore was struck in one of the levels of the old works, and the 5-stamp mill on the property will start up immediately. It is owned by Chicago people.

Scientific Progress.

Refractory Clays.

The most important of the single components of clay are: Alumina, silicic acid, the latter often in chemical combination, sometimes in mechanical admixture, water lime, peroxide of iron, magnesia, and alkali. Clay rich in lime is called marl, while highly ferriferous clays are called loam. These two kinds are not counted among the refractory materials. Clay earth or oxide of alumina melts in the flame of the oxyhydrogen gas blow-pipe, whereby the kind chemically produced appears to be more easily fusible than the natural article. Silica melts at the same temperature as platinum, the chemical product, too, being more easily fusible than the natural silica, as quartz or rock crystal.

When alumina is mixed with silica, or when both materials enter into a chemical combination, or, as it is often noticed with natural clays, when silica is partly combined with clay earth as silicate of alumina, partly admixed mechanically, the chemical law applies to this combination of the two substances, that if two solid bodies enter into a combination the melting point of this combination is lower than the average of the melting temperatures of the two bodies. A mixture of alumina and silicic acid, or the chemical combination of silicate of alumina melts at the same temperature as wrought iron, but the melting temperature rises with the quantity and size of grain of the sand admixed.

When we mix one part (weight) of alumina with one, two, three, or more parts of sand, give to these mixtures the same shape, and heat them to the temperature where cast steel melts, we can observe that the mixtures with higher sand contents begin to slag later. But when the temperature rises above the melting point of cast steel the mixtures richer in sand will cake sooner than those with higher contents of alumina.

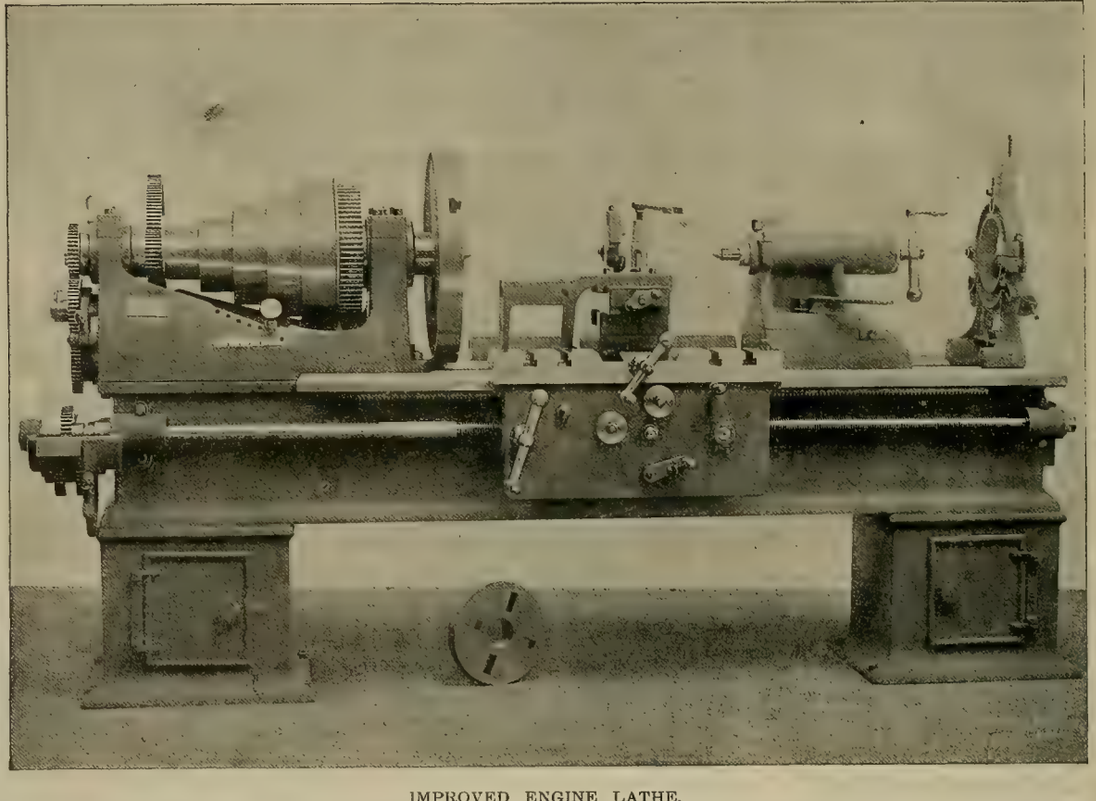
Adding to the different mixtures of alumina and sand the substances known as flux, as lime, peroxide of iron, etc., double combinations of alumina and silicic acid, and of silicic acid and the bases of the flux are produced at high temperatures. The melting point of this double combination, however, is again lower than that of the chemically pure silicate of clay. This mixture corresponds, on the whole, to the natural fire clays and these melt, therefore, the easier the more flux they contain, with equal quantities of alumina and silicic acid, or the larger the silica contents with equal quantities of alumina and flux. The contents of alumina appear, therefore, to be determinative for the refractory of the fire clays.

The refractory power and value of clay can be ascertained by means of chemical analysis. The refractory power is dependent upon the proportion of alumina to silicic acid and flux.

THE philosophy of color in light may be presented in this way: It is noted that the light from an electric arc, for instance, when seen near at hand, has a distinctively bluish color, but this same light, when viewed from a distance, appears yellowish, certain of its rays having been absorbed by the water vapor in the air on its passage to the eye; for a similar reason, the sun is now, by some, considered to be a blue star; his light, which would appear intensely white and rich in blue rays especially, if it could be seen beyond our atmosphere, appears yellowish after it has passed through that atmosphere and lost some of its most refrangible constituent rays. The effect of absorption in producing color is seen in the fact that powdered bodies generally appear white, a fact accounted for when it is considered that a powder consists of particles arranged at all angles, so that the light falling upon it meets various surfaces, and is mostly reflected before it has passed below the surface, and thus the white light meeting it is not deprived of some of its constituents by selective absorption, as would be the case if it penetrated the substance and was then reflected. In this way powdered red glass appears white.

EXPERIMENTS show that a light of 1-candle power is plainly visible at 1 mile, and one of 3-candle power at 2 miles. A 10-candle power light was seen with a binocular at 4 miles, one of 29 at 5 miles, though faintly, and one of 33-candle power at the same distance without difficulty. On an exceptionally clear night a white light of 3 2-candle power can be distinguished at 3 miles, one of 5.6 at 4 and one of 12 at 5 miles.

A NEW source of power is utilized in an engine invented by Hermann Pappe of Hamburg, Germany. The most peculiar feature of it is that the material producing the power can be used continuously, without a single renewal. A mixture of ammonia vapor and carbonic acid gas, eventually under access of steam, which, however, is not necessary, is employed, so that, by the expansion of the gas mixture entering under pressure, a cooling of the vapors in the cylinder of the engine is produced. Thus, a salt of ammonia is formed by a smaller or larger part of the gas mixture. This salt is returned to a disintegrating apparatus, working under pressure, in order to be disintegrated by heat into its volatile components, which are again utilized for power purposes.



WE now know the mass of the planet Jupiter, certainly to within the hundredth part, and probably to within the thousandth of its total amount. It seems useless for our purpose to express this weight in billions of tons. It will suffice if we compare the weight of Jupiter with the weight of the earth. The result is that we find Jupiter weighs as much as 310 bodies would do if each of them had the same mass as the earth.

AN interesting novelty in passenger car construction is a renovated coach, which has been sheathed with sheet copper of No. 30 gauge, under the direction of Master Car Builder Appleyard of the New York, New Haven and Hartford Railroad Company. The copper does away with painting and varnishing, is on thin wooden sheathing, is handsome, waterproof, and can be repaired in sections.

Mechanical Progress.

Improved Engine Lathe.

The illustration on this page is of a 24-inch improved engine lathe, supplied by the Parke & Lacy Co., 21–23 Fremont street, San Francisco, who furnish upon application description of details of features intended to render them capable of more and quicker work than the old style of lathes. In the lathe portrayed the ratio of back gearing is 13 to 1; cone diameters, $14\frac{1}{2}$ to 5 inches; width of step on cone, $3\frac{1}{4}$ inches; hole through spindle, $1\frac{3}{16}$; front bearing of spindle, 4 inches diameter, $6\frac{1}{2}$ inches long; back bearing of spindle, $3\frac{7}{16}$ inches diameter, $4\frac{1}{2}$ inches long; diameter of tail spindle, $2\frac{7}{16}$ inches; lathe cuts threads, 2 to 28; feeds per inch, 4 to 80; weight of 10-foot lathe, 4000 pounds; speed of countershaft, 150; size of pulleys on countershaft, 14 inches by $4\frac{1}{2}$ inches; 10-foot lathe takes between centers 6 feet; beds made in lengths of 8, 10, 12, 14, 16, 18, 20, 22 feet; swings over carriage $16\frac{1}{2}$ inches.

IMPROVED ENGINE LATHE.

Reduction in Cost of Manufacturing.

A striking illustration of rapid changes in methods, and concomitant great reduction in cost of manufacture, is furnished in the recent history of the evolution of the incandescent electric lamp.

In 1880 I visited Edison's laboratory at Menlo Park, to inspect his new system of incandescent electric lighting. I understood, at that time, that Mr. Edison had succeeded by his methods in reducing the cost of manufacture of the little lamps one-half—*i. e.*, from about $3 to $1.50 each.

To-day, lamps far superior to the earlier forms made in 1880 are sold in large lots at less than 20 cents each! A single factory of the General Electric Company turns out 6,000,000 a year, and the output of all the factories combined is about 20,000,000 lamps per year.

It is interesting, in view of the present low cost of the lamps, to know that the carbon filament is estimated to be, weight for weight, the most valuable substance known.

Filaments for the ordinary 16-candle power lamps are worth $10 a thousand, and it takes 14,000 to weigh one pound.

The filaments in the tiny bulb lamps used for surgical and dental purposes are very much smaller, and are three times more valuable, if estimated by weight, or more than $400,000 per pound.

Formerly it was customary to estimate approximately the cost of a locomotive at $1000 per ton weight. Thus, an engine weighing 40,000 pounds would cost about $20,000. To-day, a first-class locomotive, weighing about 130,000 pounds, costs about $8000, or less than $6\frac{1}{4}$ cents per pound. Labor-saving machinery and "piece-work" systems of pay are largely accountable for these results.—A. E. Outerbridge, Jr., in Journal of the Franklin Inst.

Electrical Progress.

Electrification of Air by Roentgen Rays.

At a meeting of the Royal Society of Edinburgh, Lord Kelvin made a communication on "The Electrification of Air by Roentgen Rays," the outcome, as he explained, of experiments which had occupied his attention, along with that of Dr. Beattie and Dr. de Smolan, since the end of October last. The primary object of their investigations, he said, was to test the effect of Roentgen rays shed upon electrified air—to see whether or not the Roentgen rays had any electrifying effect on air. The following arrangement was made:

A lead cylinder 76 centimetres long and 23 centimetres in diameter was constructed. Both ends were closed with paraffined cardboard, which was transparent to the rays. At the end distant from the electrometer the Roentgen lamp was placed. In the other end two holes were made—one in the middle in which a glass tube of sufficient length was placed to allow the end in the lead cylinder to be put into any desired place in the cylinder. By means of this air was drawn through an electric filter by an air pump. The other hole, a little from the center, contained a second glass tube by which air was drawn through india-rubber tubing from the quadrangle of the University of Glasgow outside the laboratory. In one series of experiments the end of the suction pipe was kept in the center of the lead cylinder, and at various points, 10 centimetres apart, beginning with a point close to the end distant from the Roentgen lamp.

A primary object of their experi-

ments was to test whether air electrified positively or negatively lost its charge by the passage of Roentgen rays through it. They soon obtained an affirmative answer to that question. They found that positively electrified air lost its positive electricity, and in some cases acquired negative electricity under the influence of Roentgen rays, and they were thus led to investigate the effect of Roentgen rays, to begin with, on air unelectrified. In carrying out the experiments, his Lordship added, they found it absolutely necessary not only to surround the electrometer with wire gauze in the usual manner, but they had also to place it on a sheet of lead, and to surround the side facing the Roentgen lamp with lead, too. In some cases it was even necessary to cover up the whole with paper to prevent the electrified air of the room from disturbing the instrument.

Electric Ship Lighting.

When electrical plants were first installed aboard ship, lead-encased cables, run in ordinary molding, were used almost entirely, and in case of iron ships the hull was frequently employed for the return circuit. The latter method soon passed out of use, for it not only increased the fire hazard, but was inefficient mechanically, and also liable to give rise to disturbing influences on the ship's compasses.

Lead-encased conductors in ordinary molding were used on the first two United States men-of-war having electric plants—the Trenton and Omaha—but with unsatisfactory results in each case. In the latter ship, the electrical plant of which was installed by the writer in 1884, the lead-encased port and starboard mains passed through holes bored in live-oak knees (one hole to about each six feet of run), and the writer has a vivid recollection of the difficulties encountered in boring several hundred three-quarter and half-inch holes through about eight inches of gnarled oak very nearly as hard to pierce as some of the tougher metals. It is, perhaps, needless to say that the cost of labor and tools was no small item in the cost of installation.

Lead-encased conductors were finally discarded, except in some special work, as the protection from injury to the insulation and from moisture, which the lead sheath was supposed to give, was found to be illusory. Dents caused short circuiting on the sheath of the conductors, while punctures, permitting the entrance of moisture, led to bad grounds, as well as short circuits.

At the present day what may be called a composite system for the installation of the distributing conductors, is employed. Equal security in all parts of the installation is the object kept in view, and to obtain this several systems are blended together as one. While molding and flexible conduits are used in the saloons and cabins, the conductors in the machinery spaces and holds are run in iron conduits, which are thoroughly insulated on the inside, and special fittings are employed in passing through the decks and bulkheads. Special water-tight switches, cut-outs and fixtures are also used wherever there is exposure to the weather.—Cassier's Magazine.

Practical Information.

The Russian Oil Export in 1896.

The total Russian oil export for 1896 was as follows:

From—	*Residuum and Crude Oil.* Barrels.	*Lubricating Oil.* Barrels.	*Distillate.* Barrels.	*Illuminating Oils.* Barrels.
Batoum.....	70,000	392,700	763,600	4,017,200
Novorossisk....	129,300	333,500	83,100	1,464,200
Total.....	199,300	726,200	846,700	5,481,400

The Baku oil field appears to be inexhaustible. In his December report the Austrian consul at Batoum speaks of two new gushers that came in during the month, one producing from 5000 to 6000 barrels, the other over 10,000 a day. A Belgian company has been organized to develop the Grosni oil field on a more extensive scale. The work on the pipe line between Baku and Mihalovo, or half the distance between Baku and Batoum, will commence as soon as the weather opens. Drilling operations are being pushed actively at Petrovsk, and it is believed that the oil sand will be tapped shortly. A Japanese steamship company will commence in the spring to run a direct line of steamers between Yokohama and Batoum.

In an old pamphlet which was discovered recently in the Astor library in New York are some figures with reference to the cost of a piece of track laid by the Baltimore and Ohio in 1830 and 1831. I. L. Sullivan, evidently a civil engineer, in a report to R. L. Colt, estimates that the track laid with wood sleepers, wood bearers, and plate rail, exclusive of ground and gradation, would cost $4362 per mile; with stone blocks, wood bearers, and plate rail, of which the cost of iron was $1324, the cost would be $5115 per mile; with granite sills in line with plate rail, of which the iron was $2037, the cost would be $6500 per mile, divided as follows: Sills at $11.50 per 100, $3680; bar iron, $1300; broken stone, $640; various items, $880. This engineer speculated on two-ton loads and one-ton cars, and said in his report that the Baltimore and Ohio would be doing a very rash thing if they went beyond this point. He also says: "The locomotive engine now operating successfully on the Baltimore road, made by Mr. Winans to run on a friction carriage, though of moderate power, has a great useful effect." Mr. Winans was apparently the first to patent outside journals and to reduce the resistance from friction from 11¾ to 4 pounds per ton. On July 4, 1828, Charles Carroll of Carrollton, the celebrated signer of the Declaration of Independence, laid the first stone on the Baltimore and Ohio Railroad.—Railway World.

A CONCURRENT RESOLUTION is simply an expression of the members of Congress, and has no effect whatever as a law. It does not go to the President for his approval, and is no more than the advice of a majority of Congress to aid the President in the determination of any public question. In other words, it is no more than a resolution adopted by any mass meeting. A joint resolution, when passed by Congress, must go to the President for his approval or veto. If approved, it becomes a law that must be obeyed by President and people; if vetoed, it may be passed by a two-thirds vote, and thus become a law notwithstanding the objection of the President. In brief, a concurrent resolution is simply an expression of the views of Congress, binding upon no one. A joint resolution has every attribute of a law, and becomes a law when enacted by Congress, with the approval of the President or over his veto.

By the consolidation of the two great iron manufacturing firms of Schneider and Canet, of Paris, the heads of the two foundries visited President Faure recently and assured him that France now has an iron manufacturing plant rivaling the Krupp establishment in Germany.

ADVICES from Valparaiso, Chili, state that the Chamber of Deputies has passed a bill providing for a guarantee of $125,000 to any company which will establish an iron foundry on a large scale in the country.

A SCIENTIST declares that "the elements entering into the cornstalk can be made to produce alcohol, cellulose, paper, matting, smokeless powder and condition powders for cattle."

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

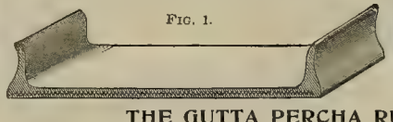

FIG. 1.

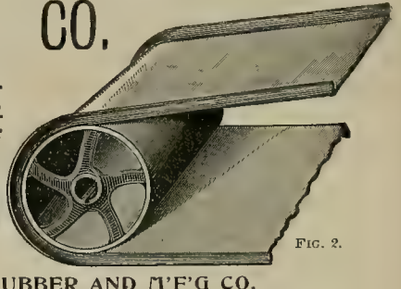

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

THE GUTTA PERCHA RUBBER AND M'F'G CO.

TELEPHONE, MAIN 1813.

WHITE, ROGERS & CO.,

Constructing Engineers and Millwrights,

NO. 306 PINE STREET, - - - - - - - - - SAN FRANCISCO, CAL.

We furnish the machinery and erect at the mines all descriptions of **STAMP MILLS** for the economical treatment of gold and silver ores. **HOISTING AND PUMPING MACHINERY**, operated by Steam, Water, or Electric Motors. **CYANIDE, CHLORINATION AND LEACHING WORKS. COMPLETE CONCENTRATING AND SMELTING PLANTS** for dressing lead ores and smelting for copper and silver. **IMPROVED AIR COMPRESSORS AND DRILLS. WIRE ROPE TRAMWAYS** for transporting ores; **ETC., ETC.**

✦✦✦ **Practical Working Plans and Specifications Provided for All Machinery Furnished or Structures Built By Us.** ✦✦✦

Coast Industrial Notes.

—Flagstaff, Arizona, has voted to issue $65,000 bonds to put in a water system.

—At Los Angeles a movement is on foot to raise $100,000 for the erection of an exposition building.

—Fourteen million dozens of eggs, worth $3,450,000, are produced annually in the State of California.

—To Japan between 20,000,000 and 30,000,000 feet of lumber were exported in 1896, of which 14,000,000 came from the United States, against about 9,000,000 for 1895.

—The Union Mill Co. of Truckee, Cal., will move their mill to Sardine Valley and next summer build a railroad from Sardine Valley to Overton, a distance of nine miles.

—Among the sums for harbor work contracted for by the Secretary of War is $400,000 for Humboldt bay, California. The river appropriations include $160,000 for the Willamette and Yamhill rivers, Oregon.

—The steamer City of Peking, sailing for China and Japan last Saturday, carried a treasure list valued at $668,839, including 361,134 Mexican dollars, $1205 in gold coin, and silver bullion valued at $301,500.

—At Pasadena, Cal., the advocates of a telephone system, to be owned and operated by the city, have been circulating a petition addressed to the Council, and asking it to take steps to forward the scheme.

—The annual meeting of the Manufacturers' and Producers' Association, at which officers will be elected, will be held March 24th. L. R. Mead, M. J. Keller and J. W. Kerr constitute the committee of arrangements.

—The orange shipments from Riverside for this season to Feb. 8th amounted to 260,972 boxes, or 912 carloads of twenty tons each. Last season's total shipments were 2018 carloads. Probably 40 per cent of this year's crop has been shipped.

—It is estimated that there will be planted this year at Chino 6500 acres of beets, and that the factory will have beets from 4500 acres in Orange county and 2000 acres in Ventura county, making a total of 13,000 acres, giving the factory about 130,000 tons of beets to work on the coming season, or more than twice as many as it had last year.

—Mayor Carlson has sent a message to the City Council of San Diego, Cal., concerning the proposed railroad to Yuma. He seeks to secure a franchise whereby he will control a large part of the bay front for railroad purposes. In addition to this, he wants San Diego to put up $480,000 as an interest guarantee on the cost of building a Yuma road.

—American contractors have a contract from the Mexican government for the improvement of the harbor at Mazatlan. About $2,000,000 will be expended in the work. If a deep harbor is secured Mazatlan will become an important port, a concession for the building of a railroad from Durango to that place having recently been granted by the government.

—Last week in the United States Court at Boise, Idaho, an order was made confirming the sale of the Oregon Short Line. Joseph Johnson of the New York Construction Co. has closed a contract for building the 103 miles of road to the Seven Devels mining district. A sub-contract for the first 20 miles has been let, subject to the approval of the New York office, and another 20 miles is to be contracted for at once. The company is contracting for men to work on the grade.

—A Bombay native firm, under whose auspices the Bombay Grain Trading Company has been formed, are said to have ordered about 3600 tons of California corn for delivery about the end of this month. The grain can be laid down in Bombay at 28 rupees per candy, as compared with 56 rupees per candy, the price of Indian wheat in that market. Efforts are being made to promote a taste for corn among the natives, apparently with some success, and a great demand for American corn in India is confidently looked forward to in the near future.

—The Union Iron Works, about March 17th, will launch two war vessels—the Wheeling and the Marietta. This is the first time that two war vessels have been launched the same time on this coast. Citizens of Wheeling, West Virginia, and Marietta, Ohio, will send delegations to participate. These two additions to the United States navy are twin-screw, light-draught composite gunboats. Their contract cost price is $219,000 and $223,000 respectively. Both vessels are of the same dimensions—174 feet long on the load water line, the beam extreme at water line 34 feet, the draught 12 feet. They are 1000 tons displacement, and their horse power is 800, and estimated speed is 12 knots. The coal supply is 250 tons, and the complement of officers, seamen and marines 146. Their armament consists of six 4-inch rapid fire guns, one forward and one aft on the main deck and two on each broadside of the gun deck. There are also four 6 pounders and four 1-pounders, all rapid fire.

Book Notices.

Handbook of British Columbia Mining Laws: This is a second edition of a summary of the "Mineral Act" and the "Placer Act" of British Columbia that will be found to be of interest to all who have to do with the mines of that northwest province. Published by Ernest H. Roome, Vancouver, B. C.; price 25 cents.

Latest Mining Laws of British Columbia, United States and the State of Washington: This pamphlet, compiled by Filley & Ogden of Olympia, Washington, will be found of value to miners of the Northwest, many of whom are interested on both sides of the international boundary line. Published by O. C. White, Olympia, Washington. Price 50 cents.

Commercial Paragraphs.

W. H. RENDELL of Florence, Col., has one of the sub contracts for the construction of the new cyanide plant at that place.

THE Zing Brewing Company of Denver, Col., now controlled by an English syndicate, is preparing to build an entirely new plant, which involves copper and iron work to the value of about $20,000

THE Iron City Manufacturing Company of Pueblo, Col., do all the iron work for the Stearns-Roger Manufacturing Company of Denver. Among the contracts which they now have on hand is the construction of the new cyanide plant at Florence.

THE Risdon Iron Works, Howard and Beale Sts., S. F., have issued a catalogue dealing with the Evans elevator and hydraulic mining machinery that will be found of value to those interested in gravel mining, especially on account of the data, tables, etc., given. Much has been done of late years in the way of developing new methods for working gravels where difficulties as to dump, shortness of water supply and lack of pressure are met with, and many of these are explained in this catalogue.

THE E. P. Allis Co. has received advices of the completion of a complete concentrating plant, furnished for Jorge Basadre, Tacna, Chili, South America, 150 miles distant from a railroad. All the machinery had to be transported by mule back, and no piece weighed over 150 pounds, consequently all the machinery, etc., had to be made in sections not weighing over 150 pounds. The iron beams for the building and all the other parts were also made in these sections. The labor employed in constructing and erecting the buildings and machinery was principally comprised of Bolivian Indians. The plant will soon be in operation.

THE Colliery Engineer Co., Scranton, Pa., proprietors of the International Correspondence Schools, announce that, commencing with the February issue, the name of the journal, *Home Study*, which they publish, will be changed to *Home Study Magazine*, the page will be reduced to magazine size, but the number of pages will be doubled. The articles relating to particular branches of industrial science will be grouped in separate issues. Articles relating to steam engineering will be published in the February and August issues; those on plumbing, heating and ventilation in the March and September issues; those on architecture in the April and October issues; those on civil engineering in the May and November issues; those on electrical engineering in the June and December issues, and those on mechanical engineering in the July and January issues. Each issue will contain other articles, but, as a rule, the general reading portion will consist principally of articles on some particular technical subject. More space will be given to the answers to inquiries department. Inquiries relating to the various trades and professions will be answered in the order in which they are received, without regard for the special edition in which they are published. Each issue will contain a drawing plate, with instructions for drawing it, and an effort will be made to adapt the plate to the subject treated in the issue in which it appears. These plates will be of great assistance to anyone who desires to learn drawing and will be valuable for reference. The subscription price is $1 50 a year, but subscriptions will be accepted at 30 cents for any of the two-number editions.

Recent California Mining Incorporations.

Van Tassel M. and W. Co., San Francisco; capital stock $150,000—$500 subscribed. J. Curtin, J. W. Wright, A. McDonald, E. McMartin, W. R. Smedberg.

Inyo County M. and D. Co., Los Angeles, Cal.; capital stock $200,000—$78.000 subscribed. C. A. Ludden, G. Couch, C. E. White, R. A. Wallace, S. F. Owen, R. J. Tarr, F. B. King, Pomona.

Horseshoe M. Co., San Francisco; capital stock $1,000,000—$2000 subscribed. C. E. Green, A. F. Morrison, San Francisco; J. D. Bradley, J. F. Peck, A. G. Clough, Merced; C. E. A. Foerster, San Mateo.

Almatah G. M. Co., San Francisco; capital stock $100,000—$55,000 subscribed. H. C. Henderson, G. Gall, A. Woodside, T. Frolich, San Francisco; J. C. Jens, Belmont.

Bank of England Con. G. M. Co., San Francisco; capital stock $600,000—$300,000 subscribed. T. Frolich, A. Gall, A. Woodside, San Francisco; J. C. Jens, Belmont; W. J. Woodside, Belfast, Ireland.

Personal.

JNO. L. NEAGLE is president of the Hydro Smelting and Refining Co., Tacoma, Wash.

CHAS. R. WORTS has removed his sampling works from Tucson, Arizona, to Johannesburg, Cal.

CHARLES BUTTERS left San Francisco last Tuesday for London on his way to South Africa.

STATE GEOLOGIST T. A. RICKARD of Colorado has returned to Denver from an eastern Oregon trip.

A. B. MCCAW has returned from New York and is investigating some Calaveras county property.

P. T. FARNSWORTH has been appointed general manager of the Mammoth Mining Company, Utah.

E. C. ENGLEHARDT has accepted the position of superintendent of the Page Reduction Works, now being built at Florence, Colo.

M. E. MACDONALD has resumed the position of superintendent of the Gibbonsville, Idaho, properties of the American Development Co.

THOMAS CURRANS, president of the Silver King Mining Company of Utah, has recently been in California, looking over our gold fields.

G. M. HYAMS, consulting engineer of the Boston & Montana, and identified with the reorganization of the Butte & Boston Company, is in California to inspect the Merced gold mining properties, in which company he is also interested.

Recently Declared Mining Dividends.

Utah, Utah, $2000, payable Feb. 6.

Silver King, Utah, $7500, payable Feb. 8.

Sacramento, Utah, $5000, payable Feb. 25.

New York and Honduras Gold Mining Company, Rosario, $15,000, Feb. 15th.

Quincy Copper Mining Company, Michigan, $400,00 , Feb. 15th.

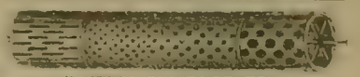
Bullion-Beck Mining Company, Utah, $1 per share, $100,000; a total to date of $2,067,000.

Mercur Mining Company, Utah, 12½ cents per share, $25,000; total to date, $615,000.

Centennial-Eureka Mining Company, Utah, $1 per share, $30,000; total to date, $1,920,000.

South Swansea, Utah, $7500, payable February 20; a total to date of $22,500.

Standard Con. M. Co., Bodie, Cal., ten cents per share, payable March 23.



Daly, Utah, $37,500, payable Feb. 22. The total to date is $2,924,000.

FOR SALE---CHANNEL GRAVEL PROPERTY.

One Hundred and Two Acres at Reasonable Figures.

No cement. Permit to hydraulic assured. Expense for impounding debris comparatively small. Cheap water. Reasonable time for prospecting. Will negotiate with principals only, or authorized agents. Cash proposition. Address GRAVEL MINE, P. O. Box 66, Placerville, Cal.

E. E. BURLINGAME'S ASSAY OFFICE AND Chemical Laboratory. Established in Colorado, 1865. Samples by mail or express will receive prompt and careful attention. Gold and silver bullion refined, melted and assayed or purchased. Address 1735 and 1738 Lawrence Street, Denver, Colo.

Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

PRACTICAL WORKING TESTS OF ORE BY ALL PROCESSES.
STAMP MILL AND CONCENTRATOR IN OPERATION ON PREMISES.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemicals has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The manager of one of the largest mines in the Mercur District, Utah, wires: "We now begin to understand dioxide process; last twenty days treated 220 tons per day of $36.50 ore, average of all tailings samples $0.83."
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The simplest, most economical and best power. Address WEBER GAS & GASOLINE ENGINE CO., 430 Southwest Boulevard, Kansas City, Mo.

Pelton Wheels in India.

The illustration on this page affords a very good example of the enterprise of one of our well known manufacturing firms in reaching out after foreign trade. When once assured of the home market, they set out to encompass the earth with the products of their skill and labor, and now appear to have realized all reasonable expectations in this way, as there are few countries open to travel where Pelton wheels may not be found transmuting waterfalls into power for electric lighting and all the manifold uses of science and civilization.

One of the means by which this result has been accomplished is that of having a corps of skilled engineers constantly in the field, planning and installing works wherever such service is required in any part of the world.

The cut here referred to shows one of their engineers, with native assistants, making a survey for a large power station in the Malay Peninsula, not far from Singapore—the plant being for the purpose of supplying several large towns with power and light by means of electric transmission.

In addition to the work here referred to, this firm shipped by the last steamer three wheel plants to the island of Java, in the East Indies, including pipe lines and all appliances connected therewith. These plants are for the purpose of furnishing power to run the machinery of sugar, tea and coffee plantations, as well as furnishing light.

The advantages of water power, where it can be availed of by such simple and comparatively inexpensive means, are coming to be better appreciated and understood the world over. With electricity as a medium of transmission, there are few localities that cannot make use of the economies that such a power affords.

AN ENGINEER OF THE PELTON WATER WHEEL COMPANY AND HIS CORPS OF ASSISTANTS MAKING A SURVEY FOR AN ELECTRIC POWER STATION IN THE MALAY PENINSULA.

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

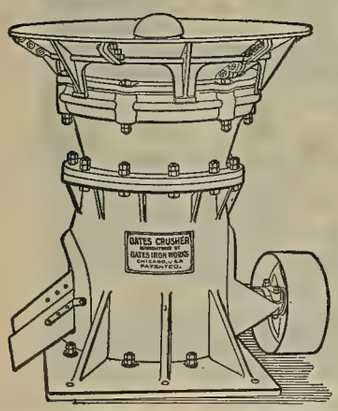
HENDY-NORBOM CONCENTRATOR.

Office of WEBB GOLD MINING COMPANY,
G. McM. ROSS, SUPERINTENDENT,
BROWN'S VALLEY, CAL., Sept. 14, 1896.

Mr. John O. Norbom—DEAR SIR: I have been using your Concentrators at our mines in Brown's Valley and am pleased to inform you that they are in every respect thoroughly satisfactory. When erecting the plant at the above-named place we built Canvas plant, but since putting in your Concentrators we have but little use for that. The percentage of sulphurets now being handled is from 1½ to 2 per cent, mostly galena and iron pyrites, and crushed fine. We save from the pulp over your machine 98½ per cent, and it hardly pays for the labor on the Canvas plant. The motion given your Vanner by its delicately constructed curved springs renders it a perfect machine, and in my estimation it is but a short time before it will replace all other machines of a like nature now in use.

Yours very respectfully,
[Signed] F. W. PAGE,
General Manager Webb G. M. Co.

SAN FRANCISCO, CAL., Jan. 31, 1897.



Joshua Hendy Machine Works—GENTLEMEN: I have used two of your Hendy-Norbom Concentrators for two seasons in Alaska, and wish to say that in their operation they have given almost perfect satisfaction. They have handled ten tons each per day of ore carrying from 3 to 6 per cent of sulphurets, an average saving of 95 per cent.

With ores carrying 3 to 4 per cent sulphurets, they will easily handle ten tons each per day and save over 95 per cent; but with a more heavily sulphuretted ore the quantity given them to work should be less.

With the improvements you have made in this machine since ours were bought, I should say that your Concentrator was almost perfect in capacity and in saving and wearing qualities.

Yours truly,
[Signed] N. S. TROWBRIDGE,
Supt. Bald Eagle M. Co.

GATES ROCK AND ORE BREAKER

still leads the world. It has greatly cheapened the cost of macadam and ballast, and made low grade ores profitable
180 large sizes shipped to South Africa.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,
